Angra, the capital of the Azores, a seaport at the head of a deep bay on the south coast of the island of Terceira. It is a station for ships between Portugal and Brazil and the East Indies; but the harbour is very much exposed. It is the seat of the bishop; is well built, but dirty; has fine churches, and is strongly fortified. Pop. (1878) 11,070, many Jews. There is a considerable export of wine, cheese, honey, and flax. Since 1834 it has added to its name the words 'do heroísmo,' for the conduct of its citizens in the struggle against Dom Miguel (1830-32).

Angra-Pequena, a bay on the south-west coast of Africa, in 26° 27' S. lat. and 15° E. long. It gives name to the southern littoral of Great Namaqualand (q.v.), extending 200 miles from 26° S. lat. to the Orange River, or Cape Colony, and reaching 90 miles inland—a sandy, waterless region, but rich apparently in metals, and enjoying a healthy climate. In 1883 Angra-Pequena was ceded by a Namaqua chieftain to Lüderitz, a Bremen merchant; and next year it was taken under German protection, with all the coast to the north as far as Cape Frio, except Walvisch Bay, which belongs to England.

Angri, a town of South Italy, 17 miles NW. of Salerno, with cotton and silk spinning, and 7110 inhabitants.

Ångström, ANDERS JONAS, a Swedish natural philosopher, was born 13th August 1814, and in 1833 entered the university of Upsala, where he became a *privat-docent* (1839), keeper of the observatory (1843), and professor of physics (1858). From 1867 till his death, 21st June 1874, he acted as secretary to the Royal Society of Sciences at Upsala. His works embrace the subjects of heat, magnetism, and especially optics. His *Recherches sur le Spectre solaire* (Berlin, 1869) was an important supplement to Kirchhoff's great work on the Solar Spectrum. Other works were *Sur les Spectres des Gases simples* (1871) and *Mémoire sur la Température de la Terre* (1871).

Anguilla, or **LITTLE SNAKE**, an English West India Island, one of the Lesser Antilles, lying 160 miles almost due E. of the eastern extremity of Porto Rico. Area, 35 sq. m.; pop. 2500. The island is long and winding in form, is very flat in surface, and contains extensive pasture for cattle

and horses. Phosphate of lime and salt are exported.

Anguilla. See EEL.

Anguis. See BLIND-WORM.

Angus. See FORFARSHIRE and DOUGLAS.

Anhalt, a duchy of the German empire, almost entirely surrounded by the Prussian province of Saxony, which breaks it up into two principal and five smaller portions. Area, 869 sq. m.; pop. (1875) 213,689; (1885) 247,603, nearly all Protestants. Dessau, Zerbst, Bernburg, Köthen, and Ballenstedt are the principal towns. In the eastern part the country is level and fertile, producing wheat, flax, rape-seed, hops, and tobacco; but the western part, approaching the Harz Mountains, is hilly and largely covered with wood, and possesses mineral wealth, especially in lead and silver. Anhalt began to be an independent principality in the first half of the 13th century. It has been repeatedly, in the course of its history, divided amongst branches of the reigning family. It was divided into three duchies in the beginning of the 17th century, but the first line becoming extinct in 1847 and the second in 1863, the whole territory was reunited into one duchy.

Anhydrides is the term now commonly given to the compounds formerly known as anhydrous acids, which was a very unsatisfactory name, seeing that these bodies do not present any of the ordinary properties of acids. In some cases they are the result of the dehydration of acids, and in all cases they represent in their composition the acid *minus* water. Thus, in the following equation, we give an example of the formation of an anhydride:

The anhydrides of the monobasic acids are formed in various ways; thus, hypochlorous anhydride is formed by the action of chlorine on oxide of mercury; nitric anhydride is formed by the action of chlorine on nitrate of silver, &c. The anhydrides of tribasic acids are often formed by the mere action of heat on the acids, as is the case with lactic and tartaric acids.

The anhydrides present no uniformity of appearance; for example, carbonic anhydride (commonly known as carbonic acid, which in reality is $\text{CO}_2\text{H}_2\text{O}$) is a gas; phosphoric anhydride is a white powder; nitric anhydride occurs in crystals; sulphuric anhydride is a ductile wax-like substance; while the anhydrides of the organic acids are oily bodies heavier than water.

The most important property of this class is their conversion into the corresponding acids, under the influence of water.

Anhydrite, a mineral, consisting of anhydrous sulphate of lime, with some slight addition of sea-salt, appears in several varieties, as (1) granular, found in concretions with a foliated structure; (2) fibrous, easily broken with a fracture in delicate parallel fibres; (3) radiated, translucent; (4) sparry, or cube spar; (5) compact, of various shades, white, blue, gray, red. Anhydrite is converted into gypsum by combination with a certain proportion of water, and, where it is found in large masses, as on the south of the Harz Mountains near Osterode, the surface consists of gypsum. For building, anhydrite has no great value, on account of its tendency to this change; but some of its varieties, especially the Siliciferous or Vulpinite, found at Vulpino, in Upper Italy, are used for sculptures, and take a fine polish. When burned and reduced to powder, it is used as a manure, resembling gypsum in its effects.

Anhydrous is the term applied to a chemical substance free from water. Thus, ordinary lime-

shell as it comes from the kiln is simply lime, CaO , without any water, and is called *anhydrous* lime; but when water is thrown upon the lime-shell, the liquid disappears by combination with the lime, which very much increases in volume and becomes *hydrated* lime, CaOH_2O . Again, ordinary stucco, before being used by the modeller, contains only lime and sulphuric acid, CaSO_4 , with no water, and is therefore anhydrous; but when water is added, and the stucco sets into its mould, it combines with two equivalents of water, and becomes hydrated stucco, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Examples of anhydrous substances are also found amongst liquids; thus, alcohol free from water is called anhydrous alcohol; and in like manner we speak of anhydrous acetic acid, anhydrous nitric acid, &c.

Ani, a ruined city of Turkish Armenia, about 25 miles SE. of Kara. In the 10th century it was the capital of the Bagratide kings of Armenia. Afterwards it was repeatedly taken and sacked, and in the 14th century it was finally overwhelmed by an earthquake. Numerous ruins of buildings and massive walls remain.

Aniline, or AMIDO-BENZENE, was discovered in 1826, as a product of the dry distillation of indigo; hence the name, derived from *anil*, the Portuguese for indigo. This source has now ceased to be of importance, for, practically, all the aniline now manufactured is obtained from coal-tar. When coal is heated in the manufacture of illuminating gas, a large number of substances are produced, and are obtained as a tarry matter of varying composition. Only a few of these bodies are of commercial importance, the chief being ammonia, carbolic acid, anthracene, naphthalene, pitch, and benzene. It is this last-named substance that yields aniline. If it is treated with strong nitric acid, an intermediate compound, nitrobenzene, $\text{C}_6\text{H}_5\text{NO}_2$, is formed, which, when mixed with acetic acid and iron-filings, yields acetate of aniline. Aniline may also be prepared by passing a mixture of benzene and ammonia through a red-hot tube, after the following reaction:

Aniline may be regarded either as benzene in which one atom of hydrogen has been replaced by the group amidogen, NH_2 , or as ammonia, NH_3 , in which one atom of hydrogen has been replaced by the radical phenyl, C_6H_5 ; and according as the one or other view is held, it is called amido-benzene or phenylamine (see AMINES).

The pure article is a colourless oily fluid, slightly soluble in water, but readily dissolving in alcohol and ether. It refracts light strongly, and possesses a weak aromatic taste. It boils at 360°F. (182°C.), and when pure, has a specific gravity of 1.020. It is a well-marked *Base* (q.v.), producing numerous crystalline salts, although it has no alkaline action on vegetable colours. It is a powerful narcotic poison, its fumes causing giddiness, and subsequently insensibility, while the body becomes of a livid leaden-blue colour. Taken internally, it soon causes death; and even when respired in small quantity, as by the workmen engaged in its manufacture, it causes severe headaches, nausea, and vomiting.

It is, however, as being the source of the numerous aniline dyes, that this body has become of leading importance.

Aniline unites with acids, forming salts, but these do not constitute the *aniline dyes*. These consist of various bases obtained by the oxidation of aniline by means of nitric acid, chlorine, arsenic, or other agents. In many instances these bases are quite colourless, and only develop their tints

when formed into salts. They may be regarded as Amines (q.v.)—i.e. ammonia in which hydrogen has been replaced by one or more radicals. Thus we have diphenylamine, $\text{NH}(\text{C}_6\text{H}_5)_2$; dimethyl aniline, $\text{N}(\text{C}_6\text{H}_5)(\text{CH}_3)_2$; methyl ethyl aniline, $\text{N}(\text{C}_6\text{H}_5)(\text{CH}_3)(\text{C}_2\text{H}_5)$; and so on. To refer at length to the various aniline dyes would be impossible, as these now number some hundreds, and we can only indicate the leading varieties. The colours produced by these dyes include every shade and tint, and the list of red or violet compounds would alone exhaust our available space. *Fuchsine*, which may be taken as typical of the red dyes, is formed when aniline is treated with strong nitric acid; but, in practice, many other chemicals may be substituted for the acid. *Blue dyes* are produced when aqueous aniline salts are treated with chlorate of potash and hydrochloric acid. *Mauveine*, a powerful violet dye, was discovered by Perkin in 1856, and this led the way in the manufacture of aniline colours. Perkin produced it by acting on aniline with bichromate of potash. We must pass over the various green, brown, yellow, and gray dyes, merely mentioning that the so-called aniline blacks are usually either very intense greens or blues, appearing black through concentration.

The aniline dyes are noted for their intense colouring power, one part of a rosaniline salt in a million parts of water still possessing a deep crimson colour, and instantly dyeing a skein of silk moistened with vinegar. Even in so dilute a solution as one grain dissolved in 1500 gallons of water, it is capable of dyeing a silk thread immersed in it for twenty-four hours.

Many of the dyes exhibit complementary colours (see LIGHT) when looked at by reflected and transmitted light; thus, the strong solution of the salt above referred to looks a purple red by transmitted, and a brilliant green by reflected light; a fact familiar to the users of an aniline red ink, or an ink for any of the familiar 'graph' copying processes. Here the pen assumes a green shining appearance, quite different from the colour of the ink. Aniline dyes are used as lacquers for cheap toys, being readily soluble in spirit varnish, the well-known 'bronzing liquid' being an example of this. Mixed with gelatin or collodion, and allowed to dry in thin sheets, they furnish the thin transparencies so much used for producing stained glass imitations. They have been also used for colouring wines and sweetmeats, but as arsenic was formerly or is still employed in the manufacture of the red varieties, this practice is not unattended with risk. The use of arsenic has of late been largely abandoned; or, when used, makers take care to eliminate the arsenic at the end of the process, so that the final product is innocuous. Numerous cases of skin-eruptions have been traced to the wearing of red flannel or red stockings dyed by aniline dyes. The readiness with which any housewife can dye articles of clothing or household ornaments has made them great favourites. The chief drawback lies in the fugitive nature of many varieties, but notwithstanding there is a wide field still open to them. The aniline colours are as a whole disapproved from the artistic point of view. Some of them are especially objectionable when used in the same textile fabric along with natural dyes. Notwithstanding this, the introduction of aniline dyes is said to have closed half the dyers' shops in India. A few years ago the Shah of Persia prohibited the importation of these colours into that country. Further details about aniline dyes are given under the head DYE-STUFFS. Although England and France were first in the field, Germany took up the manufacture with so much zeal and scientific skill that it soon surpassed its competitors, pro-

ducing superior shades of colour. Germany is now the headquarters of the industry, its products being of the highest class and the lowest price. The produce in Germany is estimated to be a third greater than that of France, and three times that of England; while the annual value of English aniline colours may amount to a million and a half. See Perkin, 'On the Coal-tar Colours,' in *Nature*, vol. xxxii.; and *The Chemistry of the Coal-tar Colours*, by Benedikt (Eng. trans. 1886).

Animal. The popular classification of all bodies into three 'kingdoms'—the animal, the vegetable, and the mineral—only assumed authority in comparatively recent times, and has done much mischief in exaggerating the apparent differences between plants and animals on the one hand, and in obscuring the fundamental distinction between these and minerals on the other. There are in reality only two kingdoms of nature, the living and the non-living—the organic and the inorganic. The famous aphorism of Linnaeus, 'Stones grow; plants grow and live; animals grow, live, and feel,' is no longer satisfactory, for growth is of two distinct kinds. While growth in minerals takes place merely by *accretion*—addition of new particles to the external surface, that of living matter is by *intussusception*—the interposition of new molecules between those formerly present. Again, living matter, or *protoplasm*, is clearly distinguished by its chemical composition, it being composed of very highly complex compounds, or mixture of compounds of carbon, nitrogen, hydrogen, oxygen, and sulphur, together with water and salts. During life, it is incessantly *disintegrating* and combining with the oxygen of the atmosphere, many products of change, chiefly carbonic acid, water, and nitrogenous waste being evolved; and *reintegration* must therefore take place by *intussusception*, for which purpose new matter containing the necessary elements must be taken up, either from other organisms or from the inorganic world. Certain *cyclical changes* are also exhibited by all forms of living matter—that is to say, each arises as a detached portion of some previous organism; develops into a form similar to that from which it arose; tends to reproduce itself; and, finally, ceases to live, when its protoplasm breaks up, and its elements ultimately return in a highly oxidised state to the inorganic world. Moreover, certain conditions of temperature, pressure, presence of oxygen, &c., variable only within comparatively slender limits, are essential to the maintenance of life.

While living bodies are thus clearly distinguishable from inorganic, every attempt to erect a similarly sharp distinction between plants and animals completely breaks down. Vast numbers of animals are destitute of the power of locomotion, so that, for instance, corals were unhesitatingly referred to the vegetable kingdom until about a century ago; while diatoms, and many embryonic algae and fungi, which possess marked powers of locomotion, would thus require to be ranked as animals. Nor is sensibility a purely animal characteristic; the well-known sensitive plant, the sun-dew, and Venus's fly-trap, exhibiting it in the most marked degree. Cellulose, again, which forms the coating of the vegetable cell, was regarded as completely characteristic of this; but many algae and fungi are naked at some period of their lives, while the thick external tunic of those degraded vertebrates known as Ascidians has essentially the chemical composition of plant cellulose. Chlorophyll, the green colouring matter of plants, is absent from fungi and from many flowering parasites, and is yet present in infusorians, in Hydra and some other invertebrates, which are thus enabled to vegetate in sunshine, forming starch and evolving oxygen.

Animals thus do not necessarily feed; while the well-known insectivorous plants (see *DIONÆA*, *SUN-DEW*) capture animals, and frequently digest them.

The attempt to establish a difference in structure is equally unsuccessful; for although the students of higher forms have no difficulty in grouping their flowers and ferns, their birds and beasts, into distinct series, the microscopist finds that these two great stems arise from a common root. It has therefore repeatedly been proposed to divide living forms into three groups—Animals, Plants, and *Protista*—a solution which, while decidedly gaining adoption on account of its great service in treating together the lowest forms hitherto separated as Protozoa and Protophytes, of course raises minor difficulties—that of distinguishing on the one hand between Protists and Animals, and on the other, between Protists and Plants. And thus every attempt to limit and define its forms has really resulted in proving the fundamental unity of life. The general study of the phenomena of life constitutes the science of Biology, of which the sub-sciences are usually reckoned as four: (1) Morphology, dealing with the structure of organisms, and including Anatomy and Embryology; (2) Distribution, dealing with the time and place of their occurrence on the earth; (3) Physiology, dealing with the study of their functions; (4) *Ætiology*, dealing with the explanation of the preceding facts by the rival hypotheses of Creation and Evolution. These subjects are divided between botanist and zoologist, and their labours, while starting, as has been shown, from a common point, thence diverge widely. The results of Animal Morphology are outlined in the articles ZOOLOGY, VERTEBRATA, &c.; and those of the study of Animal Physiology under the heads of the separate functions, DIGESTION, NUTRITION, REPRODUCTION, &c. See also GEOGRAPHICAL DISTRIBUTION, EVOLUTION, &c. For Animal Intelligence, see INSTINCT.

Animal Chemistry. The objects of animal or physiological chemistry are, to investigate the composition and properties of protoplasm and its various modifications which form the tissues and organs of living beings, and to ascertain the precise nature of the constructive and destructive changes which take place in those tissues and organs during the performance of their functions.

Protoplasm is always found to contain much albuminous or proteid matter, together with smaller quantities of amyloids and fats, and its molecule is conjectured to include representatives of all these three classes. Much water is also present, together with small quantities of numerous products of functional activity. We may briefly refer to these.

Proteids (q.v.) are at present classified as follows: (1) Native Albumens (egg, serum, &c.); (2) Derived Albumens (acid and alkali albumens, casein); (3) Globulins (globulin, myosin, vitellin, &c.); (4) Fibrin; (5) Coagulated Proteids; (6) Peptones; (7) Lardacein. Certain nitrogenous bodies allied to proteids are mucin, chondrin, gelatin, keratin, nuclein, &c., which form the principal components of mucus, cartilage-matrix, connective tissue, epidermic structures, and cell nuclei respectively.

The *Amyloids*, or carbo-hydrates, from their far less complex structure, are much better understood. The most important of these are grape-sugar (glucose, dextrose, diabetic sugar), $C_6H_{12}O_6 + H_2O$; milk-sugar (lactose), $C_{12}H_{22}O_{11} + H_2O$; muscle-sugar (inosite), $C_6H_{12}O_6 + 2H_2O$; glycogen or animal starch, $C_6H_{10}O_5$; and dextrine, $C_6H_{10}O_6$.

The fats, with their derivatives and allies, form very complete series, acid, neutral, and nitro-

genous, of which the composition is tolerably well known. The acetic acid series, $C_2H_3O_2$, is best represented, including formic (in blood and many tissues, also secreted by ants, &c.); acetic (in stomach during fermentation of food, in diabetic urine, &c.); propionic (in sweat, &c.); butyric (in milk; also sweat, urine); valerianic (in fæces); caproic, caprylic, and capric (in butter); lauro-stearic and myristic (in spermaceti, &c.); palmitic and stearic acid (in human fat). Of the oleic series, $H(C_2H_3)_nO_2$, many members are known. Human fat is a mixture of oleic, palmitic, and stearic acids in combination with glycerine. The glycolic acid series is represented by lactic acid, the oxalic series supplying oxalic and succinic acids. Cholesterin is abundant in nervous tissue and in bile, &c. The complex nitrogenous fats are lecithin, neurin, cerebrin, &c.

The most important product of nitrogenous waste in mammalia is urea, $(NH_2)_2CO$, which forms the chief solid constituent of urine, and occurs in traces in blood and most tissues, except muscle, which, however, contains intermediate products of decomposition. Little is yet known of its relations to the proteids, from which it arises; but Schützenberger has succeeded in decomposing albumen into carbonic anhydride and ammonia in the same ratio as urea, and therefore concludes that the molecule of albumen is a complex ureide. Uric acid, $C_5H_4N_2O_3$, predominates in the urine of birds and reptiles, but it is also present in small quantities in that of mammals, and its salts form gouty and urinary concretions. Kreatin, kreatinin, and sarkin occur constantly in muscle; xanthin, guanin, &c. in urine; glycocoll and taurin in combination in the bile acids, &c.; leucin and tyrosin, as products of pancreatic digestion.

Most of the preceding substances, though seldom constant, appear to be of exceedingly wide distribution throughout the animal kingdom. A few substances, including several of the more important proteids, grape-sugar, muscle-sugar, peptic and diastatic ferments, are also of frequent occurrence in the vegetable kingdom; while some of the most important and characteristic vegetable compounds also occur incidentally among animals—e.g. cellulose, chlorophyll, and starch. The whole progress of research tends to show the fundamental unity, not only of the composition of animal and vegetable protoplasm, but also of most of the processes of waste and repair in animals and plants alike. Thus, for instance, it has been proved by analysis that allantoin, a body analogous to urea, and known as an important waste product of the vertebrate embryo, is also found in quantity in opening buds in spring. Cholesterin, too, has been prepared from carrots, while pepsin can be obtained alike from the stomach, from the plasmodium of a myxomycete, or from the digestive secretion of an insectivorous plant.

See PROTOPLASM, also BLOOD, BONE, MUSCLE, &c.; DIGESTION, NUTRITION, RESPIRATION, &c.; also FAT, UREA, ALBUMEN, PROTEID, &c.; Gamgee's *Physiological Chemistry*, and Foster's or other modern *Text-book of Physiology*.

Animalcule, a term which, although etymologically applicable to any very small animal, is limited in ordinary language to those which are microscopical. Animalcules exist in prodigious numbers, their size being such that myriads of them find ample space for all the movements of an active life within a single drop of water. Sea-water often contains them in enormous numbers, and the luminosity of the sea is often due to this cause (*Noctiluca*). Although, contrary to a widely diffused belief, they occur only in very small number in drinkable waters, they abound wherever

water becomes stagnant, or contains decomposable organic matter. Thus rain-water allowed to stand long in an open cistern, or the water of a vase in which cut flowers are placed, soon becomes more or less turbid and offensive; and if a drop be placed on a slip of glass and examined, even with a pocket lens, a multitude of living beings can be seen moving rapidly in all directions, while minute specks are also to be seen in motion between these. On the application of higher microscopic power, new organisms come again into view, so that the variations of size between the invisible inhabitants of one drop are as great as those between whales and minnows. An immense variety of animalcules can very easily be studied by collecting impure water from a dozen different sources, and keeping it separate in open wide-mouthed bottles in a window, and observing from time to time; for not only do the contents of the different vessels differ from each other, but they also vary greatly with the season, so that an unending source of new surprises is thus open to the most inexperienced microscopist without leaving his room. Besides obtaining numerous varieties of microscopic algae, diatoms, bacteria, &c. (see *ALGÆ*, *DIATOMS*, *PROTOPHYTES*), examples of all the leading forms of minute animal life are thus to be obtained; and these, at first supposed to belong to the same general type of structure, are now known to be extremely varied. The simplest form which the observer will meet is a naked lump of jelly-like protoplasm, constantly flowing into new shapes, the *Amœba* (q.v.); while other masses of jelly, the *Foraminifera* (q.v.), may be found possessed of coverings of sand, or even carbonate of lime, and only protruding their irregular processes (pseudopodia) through its openings. Others again, the sun-animalcules of fresh water, and the Radiolarians, which inhabit the sea, are usually possessed of a beautifully marked flinty skeleton. These groups are usually united under the head of *Rhizopoda* (q.v.). Another great series, in which the form of the body is usually definite, the pseudopodia being generally replaced by vibratile threads or cilia, are termed the *Infusoria* (q.v.). All these are the equivalents only of a single cell of higher animals, and are therefore grouped into the subkingdom *Protozoa*; but many animalcules are of far more complex organisation. Thus the wheel-animalcules (see *ROTIFERA*) are segmented, worm-like animals; and the larvae of almost all marine and fresh-water invertebrates are at an early stage free-swimming and microscopic. From its extreme vagueness, therefore, the term animalcule is now disused by scientific writers.

Despite their apparent insignificance, certain animalcules, by virtue of their almost imperishable skeletons, are among the most important agencies which have built up the crust of the earth. The surface of the sea is largely inhabited by Radiolarians and *Foraminifera*, the former preponderating in cold, the latter in temperate and tropical waters. As they die, their skeletons sink to the bottom, and form mud or ooze, which through time and pressure becomes consolidated into rock. Many polishing stones, &c. are thus mainly composed of Radiolaria; while chalk is principally formed by the skeletons of *Foraminifera*, and greensand of internal siliceous casts of these. Many limestones, marbles, quartzites, &c. are probably of similar origin, although all trace of organic structure may have been eliminated by metamorphic change. See *PROTOZOA*, *PROTOPHYTES*, and other articles named above; also any adequate work on microscopy—e.g. *Carpenter On the Microscope*, and the *Micrographic Dictionary*.

Animal Heat. Living protoplasm is constantly in process of disintegration and oxidation, and these changes are accompanied by evolution

of heat. The greater the activity of change, the higher does the temperature tend to become. Not only, therefore, are the so-called cold-blooded animals really warmer than the surrounding atmosphere, but even plants recognisably evolve heat, and the temperature of certain flowers, where protoplasmic activity is highest, may sometimes almost reach that of the human body. See *ARUM*.

Even the infusoria evolve heat, as is shown by the slowness with which the surrounding water freezes. John Hunter showed that worms and leeches, slugs and snails, were all one or two degrees warmer than the air. Fishes generally are only two or three degrees warmer than the water they inhabit; but in some of the more active, like the bonito and tunny, a temperature of 99° F. has been observed, while the surrounding water was at 80½°. So, too, the frog, which usually averages about 1° warmer than the air, is 2° or 3° warmer while breeding; while in certain lizards and snakes, a difference of as much as 15° to 20° F. has been recorded. Newport's researches on insects show that while the temperature of the larva may vary from ¼° to 4° above that of the atmosphere, that of the pupa is almost imperceptibly higher, and that of the perfect insect may rise enormously; a difference of from 2° or 3° at rest, to from 9° to 20° in excitement, having been observed in individual bees, and a much more marked elevation in the temperature of the whole hive, which has been observed to reach 102° F. Among the animals commonly termed warm-blooded, the temperature, although generally higher in birds than in mammals, varies from species to species, yet is very nearly constant during health in each. Thus, while the average temperature of the human body is about 98·4° F., that of the wolf is 3° or 4° lower, and that of the arctic fox 5° or 6° higher. In birds, the temperature varies from 100° in the gull and other aquatic birds, to nearly 112° in the swallow, while, on the other hand, a hibernating mammal like the lemming becomes temporarily cold-blooded, its temperature during the winter sleep being comparatively little above that of the atmosphere.

From the preceding details, it will be seen that while cold-blooded and warm-blooded animals thoroughly agree in evolving considerable amounts of heat, the difference between them lies in this, that in the former the means of loss of heat by the skin, &c. are great as compared with the normal production of heat, while in the latter the loss and production of heat are kept balanced.

Physiologically considered, the animal body is a machine for converting the potential energy supplied by food into the actual energy of heat and mechanical work. What Aristotle simply referred to the heart, and mechanical physiologists to the friction of the blood, and so on, is now simply regarded as one of the results of the disintegration of the complex protoplasm. Knowing the quantity and chemical composition of the food, it is easy to calculate the amount of energy furnished to the body. The average income of energy of the human body on normal diet is about 1,000,000 metre-kilogrammes, of which about 150,000 units can be expended in muscular work, the remaining 850,000 leaving the body in the form of heat. As to the channels by which heat leaves the body, Helmholtz has calculated that fully 2½ per cent. leaves the body with the fluid and solid egesta, about 5½ per cent. is spent in warming the expired air, about 14½ in evaporating the water expired by the lungs, and the balance, about 77½ per cent., by the skin, in conduction, radiation, and evaporation.

These general considerations once grasped, the apparent anomalies and variations in the temperature of different animals present no difficulty.

While heat is given off by the oxidation of the living matter of all the tissues, the greater part is the result of the activity of the muscular and glandular systems, and especially of the former.

For the lower or cold-blooded animals, the varying temperature is simply and directly associated with the varying amount of protoplasmic waste, and this again with the varying activities of the organism. The case of higher or warm-blooded animals (mammals and birds) presents, however, greater difficulty, since here the temperature remains practically constant throughout life (neglecting slight diurnal and seasonal variations, or the more serious perturbations due to the excitation and depression of the vital processes in various diseases). Some regulative mechanism must here be present, operating on the one hand to insure the regular maintenance of a minimum temperature, on the other to check its undue rise in periods of exceptional activity. This problem has been the subject of much physiological research, and is not yet fully exhausted; its essential solution is, however, due to Claude Bernard, whose *Chaleur Animale* (1878) may be taken as a centre round which the literature of the subject arranges itself.

The regulation of heat is on the one hand automatically effected by the variations in the quantity lost in warming the breathed air, in the flow of blood through the skin, and in perspiration. Thus if more air be passed in and out of the lungs in a given time, or if the vaso-motor nerves allow the skin blood-vessels to dilate and admit of a larger flow, or if perspiration increase, the body will become cooler, and *vice versa*. But on the other hand, there is every reason to believe from the researches of Hoppe-Seyler, Liebermeister, and others, that the production of heat through the activity of muscles and other organs is controlled by means of a special heat-regulating and nervous mechanism. Eulenberg and Landors have demonstrated a certain area in the brain, which, when stimulated, affects the temperature of the body. See PHYSIOLOGY, TEMPERATURE OF THE BODY.

Animal Kingdom. See ANIMAL, ZOOLOGY.

Animal Magnetism, MESMERISM, or HYPNOTISM. From time immemorial, Egyptian conjurers and sorcerers have been accustomed to produce artificial somnambulism, usually by inducing their subject to gaze intently for a few minutes at certain cabalistic signs marked on the centre of a white plate. The Yogins, Hindu ascetics, also practise similar arts; while the peculiar states of trance or ecstasy into which the Mount Athos monks and other religious fanatics were accustomed to throw themselves are of kindred nature. So, too, many allusions in the works of classical authors relate to phenomena more or less of this kind.

About the middle of the 17th century, while the phenomena of terrestrial magnetism were attracting considerable attention, one Valentine Greatrakes, in London, professed to cure diseases by stroking with the hand. A century later, Gassner, a Swabian priest, employed a similar mode of treating disease, which he ascribed to demoniacal possession. About 1774, Mesmer, a Viennese physician, commenced to treat diseased organs by the application of artificial magnets. The phenomena exhibited by his patients, especially the more nervous of them, led him to adopt the view that the magnets operated not as special sources of influence, but as conductors of a magnetic fluid which he could communicate at will to the patient, even at a distance. Four years later, he commenced practice in Paris, with great success. His usual methods were to seat his patient with his

back to the north, to press the pit of the stomach, and make passes with his hands in front of his face, meanwhile fixing his patient's eye, and soothing him by the aid of music. Sometimes too he placed his patients in connection with 'magnetised' trees, or set them in a circle around a covered vessel from which he professed to conduct the invisible fluid, thus inducing peculiar nervous conditions. In 1785 a royal commission was appointed to examine Mesmer's pretensions. These investigators found that the same phenomena could be produced in Mesmer's more nervous patients when blindfolded, by merely inducing them to suppose themselves in the neighbourhood of any of Mesmer's magnetic appliances, though none were really present; while conversely, magnets and magnetic trees were alike powerless, if the patient were kept unaware of their proximity. The Marquis de Puységur at the same time discovered that he could induce artificial somnambulism without the aid of magnets, by passes alone; but unfortunately for further investigation, the subject fell into the hands of the arch-quack, Cagliostro (q.v.), and thus became extremely discredited by physiologists. Despite the unfavourable report of the French commission of 1785, as well as of a later one in 1831, and other subsequent exposures, vague theories of magnetic influence, odyllic force, new imponderable substance, electrobiology, or the like, kept constantly recurring, since science had nothing with which to replace them, until the investigations of James Braid, a Scottish surgeon settled in Manchester. In 1841 he went to a mesmeric séance, which seemed to him a mere triumph of imposture over credulity; but returning on another occasion to watch the details more narrowly, he was struck to find that the patient was really unable to keep his eyes open. After some reflection, he concluded that by continuous staring, the eyes with their nerve centres became fatigued, and the balance of the nervous system was thus destroyed. Resorting to experiment, he at once succeeded in throwing his servant and others into thorough mesmeric sleep by simply inducing them to gaze intently for a few minutes at the mouth of a bottle placed above, but close to, the eyes. He thus proved the absolute dependence of the mesmeric phenomena upon the physiological condition of the patient, not on that of the operator; and found that he had here to deal with a new order of cerebral states, henceforth to be classed with those of sleep, somnambulism, and insanity. He therefore proposed the word hypnotism, which now so advantageously replaces the terms animal magnetism and mesmerism. Braid continued to investigate the subject with great thoroughness and success for some years, and attempted the treatment of certain diseases by inducing hypnotism. Unfortunately, however, the evil reputation which the subject had so naturally obtained, prevented the due appreciation of Braid's discoveries, and it was not until about 1875 that the subject commenced to be thoroughly investigated by physiologists. Preyer and Heidenhain in Germany, and Richet in France, have confirmed and extended Braid's results, and we may therefore briefly sum up their observations, premising that no scientific observer has yet confirmed the statements of mesmerists as to clairvoyance, reading of sealed letters, influence on unconscious persons at a distance, or the like; and, as above stated, the influence of the mesmeriser is unnecessary, and in many cases quite unimportant.

The physiological changes which are set up are usually as follows: A spasm of the accommodating apparatus first takes place, the pupils meanwhile dilating, and the eyeballs being protruded, while the eyelids droop. Respiration and

circulation become greatly accelerated, and perspiration frequently ensues. Finally, profound stupor may follow. A very remarkable degree of insensibility to pain exists, so that even surgical operations may sometimes be performed as well as under chloroform. The reflex irritability of all the voluntary muscles is greatly increased (indeed for days after the experiment), so that stroking an area of skin produces a spasm of the subjacent muscles, which may even spread over the whole body, producing a perfectly cataleptic rigidity, so that Heidenhain indeed considers the hypnotic state as nothing more than an artificially produced catalepsy. These considerations indicate the danger of repeatedly subjecting the same person to hypnotic experiments, lest the abnormal state should be rendered permanent. Moreover, since in some persons the hypnotic state begins with general convulsions, the non-medical reader is warned against attempting to hypnotise.

During hypnotism, consciousness is diminished or dormant. The patient may, if only slightly affected, remember what has happened; if more fully hypnotised, he has no remembrance of his actions until hints are given; in the most complete state, he has no remembrance whatever. In hypnosis, however, sensory perceptions take place; but these are not converted into conscious ideas—in other words (as constantly happens in a 'brown study'), the sensation is present, but the power of directing the attention towards it is temporarily lost. Reflex action, however, goes on all the more freely in the absence of the inhibiting will; and thus movements made before a hypnotised person are perceived by the imperfectly closed eyes, and the stimulation of the organ of sense sets up a material change in the central nervous system, which liberates movements, apparently voluntary, yet not really so. Thus the patient may be induced to imitate every movement, however absurd or trivial, which is presented to him. The tendency to mimicry, so common especially in children, monkeys, parrots, &c., is thus intensified, or rather the stimulus of the sensory impression is allowed to work unchecked.

As sometimes in ordinary sleep, but here with ease and certainty, dreaming may be induced. Thus the medium may be conducted through all the stages of a journey, may be plunged into grief or raised to exuberant happiness by a few judicious suggestions. This state is nearly related to that of 'automatism at command,' where the medium obeys orders like a docile dog. Thus, as a crucial experiment, Heidenhain ordered his brother, a young medical student, to cut off his whiskers, the product of a year's assiduous cultivation, to the unbounded vexation of the unfortunate youth on awaking. So too, placing the body in a given position calls up the appropriate actions. A pillow, properly placed in the medium's arms, is nursed like a baby; music makes him dance; and so on. In all cases, the spoken command, the position of the limbs, or the sensory stimulus, sets up the impulse to the actions indicated, without either intelligence or volition being awakened.

The patient never falls down, and the power of co-ordinating the movements of walking, &c. is nearly perfect; his attitudes have often an unusual grace, and in the lighter stages of hypnotism he may converse freely and even with unwonted intelligence and emotion, due, doubtless, partly to freedom from the restraint of a knowledge of the surroundings, partly to the concentration upon a single train of thought. Very sensitive patients may be hypnotised by monotonous sounds like the ticking of a watch, or even by expectant attention, when alone.

Numerous other remarkable phenomena have

been described. Thus, by gentle pressure on the neck of a patient, he can be induced to repeat words spoken in his presence, especially when the sounds are directed to a sensitive area just below the sternum. Automatism at command is greatly facilitated by imposition of the operator's hand on the patient's head. By passes on one side, catalepsy or paralysis of the opposite side only can sometimes be induced. Remarkable disturbances of the sensation of colour may take place; and so on.

The state of the brain during hypnosis is not as yet well understood. The activity of the ganglion-cells of the cerebral cortex (with which the functions of consciousness are believed to be specially associated) appears to be inhibited by the gentle prolonged stimulation. Additional light is being obtained by experiments upon animals, of which many can be thrown into a state closely resembling, if not identical with the hypnotic.

Hypnotism is again coming into use in medical and surgical practice, and its facts have very important bearings on the phenomena of reverie, trance, somnambulism, religious excitement, mania, and spiritualism. There is reason to suspect also that the conventional surroundings and processes of education are not free from a pernicious tendency to produce and operate on essentially sub-hypnotic states of the pupils. Considerable light is being thrown upon the normal processes of cerebration, from the action and mode of correlation of the senses up to those of imagination and reasoning. See Braid's *Magic, Animal Magnetism*, &c. (3d ed. 1852); Figuier's *Histoire du Merveilleux* (1860); Heidenhain's *Animal Magnetism* (1880); Binet and Féré, *Animal Magnetism* (International Science Series, 1886).

Animals, CRUELTY TO. England has the honour of first forming societies for its prevention, and of first legislating for its punishment. The English Society for the Prevention of Cruelty to Animals was founded in 1824, the Scottish in 1839. The Fellowship of Animals' Friends was organised in 1879, with the Earl of Shaftesbury as president. In the United States above thirty branches of a similar organisation were founded between 1866 and 1881; and the movement has extended into France and Germany.

Bear-baiting and bull-baiting were put down by law in 1835; and the drawing of carriages by dogs within London by an act of 1839, afterwards extended to the rest of the country. Under the statutes passed in 1845, 1849, 1854, 1861, and 1876, cruelty to domestic animals is punishable by fine and imprisonment. To kill, maim, or wound cattle is punishable with penal servitude for fourteen, or not less than seven years. A penalty of £5 attaches to the ill-treating or torturing of any animal. Before this, injury to animals, even when malicious, such as houghing cattle, was punished only as an offence against property, and it is still so punishable. These Cruelty Acts are supposed to apply to tamed beasts in menageries. The acts prohibit bull-baiting and dog or cock fighting, and apply important regulations to the slaughter of cattle and their conveyance by rail. Working horses with painful sores is an offence which unhappily has frequently to be prosecuted. Attempts have been made to abolish by law the cruelties connected with the fashionable amusement of shooting pigeons let loose from cages; and the friends of the horse agitate to do away with the cruel use of bearing-reins. In the way of kindness to animals, mention should be made of homes for stray dogs and cats; the dogs' home in London was founded in 1861. See VIVISECTION.

Animals, WORSHIP OF, according to most students of comparative religion, is a stage in the

religious evolution, characteristic of the less cultured races, which has sometimes held its place in the higher stages of civilisation. It originates in Animism (q.v.), or spirit-worship, which is a universal phenomenon of humanity. The savage recognises in the animal, power or courage beyond his own, as well as a soul similar to his own, which continues to exist after death, and is still powerful for good or evil. Naturally, he tries to conciliate the power for evil indwelling in the animal, and thus reaches the stage of full or direct worship, in which he recognises the animal as the incarnation of a divine soul. Or he may recognise it as a fetich acted through by a deity, and in his worship he is thus reverencing only the representative or symbol of some unseen deity, who for some reason assumes the form of the animal as his symbol.

But a wider and deeper motive for such worship is his veneration for the animal as a totem or representative of a tribe-ancestor or protector. Among primitive peoples, all animals are supposed to be endowed with souls, which in many cases have formerly animated human beings. Hence a likeness is often recognised between an animal and some deceased friend, and the animal is addressed as the person would have been, and honoured with a kind of worship. The case of an ancestral soul, worshipped as incarnate in an animal body, thus forms a link between manes-worship and beast-worship; and we find this connection otherwise in the veneration of a particular species of animal by a particular family, clan, or tribe. Many tribes call themselves by the name of some animal, and even derive their pedigree from it. Its cries become the omens of the tribe, and here we may find a key to an explanation of the divination and augury of more civilised nations. This curious and widespread belief in a descent from animals in connection with a belief in transmigration into other forms, goes far to explain such phenomena as lycanthropy (see WERE-WOLF) and the unions between animals and human beings so common in folk-lore, and has doubtless originated in totemism (see TOTEM). The division of a tribe into the families of the bear, crane, turtle, &c. indicates a time when families claiming descent from ancestors holding those names have banded themselves together for the common interest; and that an ancestor should be called the bear, or turtle, or crane, indicates a time still further back, when the name was given him for some reason. Many ethnologists, notably Herbert Spencer, suppose these names to have been originally personal epithets, designating qualities or characteristics of the individual (thus, a slow man would be called a turtle, a very long-legged man a crane), which became family surnames, and eventually gave rise to myths of the families being actually descended from the animals in question as ancestors; while popular mystification between the great ancestor and the creature whose name he held and handed down to his race, led to veneration for the creature itself, and thence to full animal-worship. The name was originally a mere nickname, but in process of time the meaning of the metaphor was lost, and the belief originated and was transmitted to posterity that the animal was the actual progenitor. Though such nicknaming as this has occurred, totemism must have had a much broader and deeper foundation. The mere fear of ancestral ghosts is too narrow a basis on which to build, as Mr Spencer does, the whole structure of myth and religion, and does not allow sufficient play for the creative force of man's imagination as applied to the wondrous universe around him. Perhaps the worship of personal deities, seen in its greatest development in the North American native races, will lead us to a more satisfactory explanation of

the origin of totemism as the basis of animal-worship. The *manitou* of the Indian is almost always an animal, and is chosen by each individual at his coming of age, being pointed out to him in a dream, produced by the greatest religious act of his life—his first fast. This animal then becomes an object of worship, and its skin is carried about the person as a fetich, and its likeness painted on the body or sculptured on the weapons. Thus tattooing and primitive heraldry may be explained as forms of worship, and here also we see the reason for the superstitious fear the savage entertains of killing or eating his *manitou*, or patron-animal. The *manitou* develops into the totem, or sacred animal, of the gens or family which descends from that person, and worship is paid to all representatives of its species. Equally strong evidence is obtained from the ancient nations. Some facts are preserved in the signs of the zodiac, the majority of which are animals, or compounds of human and animal forms. There is nothing in the grouping of the stars to suggest animal forms, and the probability is, that in ancient as in modern times, stars, when named, were given names of distinction that commanded respect, if not veneration; therefore that the animals whose names were transferred to the stars were, on earth, highly, if not religiously venerated. This is borne out by the legends of the transference to the heavens of particular animals. The frequency, also, of animal-names, and of representations of the same animals upon coins, points to the same conclusion. In the old Egyptian animal-worship, also, the theory of tribe-fetiches and deified totems is borne out. We find deities patronising special sacred animals, incarnate in their bodies or represented in their figures; while many of the sacred creatures are worshipped in one locality, yet killed and eaten with impunity elsewhere.

In the modern world, the most civilised people among whom animal-worship vigorously survives lie within the range of Brahmanism. Here, says Tylor, the sacred cow is not merely to be spared; she is, as a deity, worshipped and bowed to daily by the pious Hindu, who offers her fresh grass and flowers. Siva is incarnate in Hanuman, the monkey-god, as Durga is in the jackal; the wise Ganesa wears the elephant's head; the divine king of birds, Garuda, is Vishnu's vehicle; and the forms of fish, and boar, and tortoise are assumed in the avatar-legends of Vishnu, which are at the intellectual level of those Red Indian myths which they so curiously resemble. Perhaps no worship has prevailed more widely than that of the serpent. It had its place in Egypt and among the Hebrews; in Greece and Rome; among the Celts and Scandinavians in Europe; in Persia and India; in China and Tibet; in Mexico and Peru; in Africa, where it still flourishes as the state religion in Dahomey; in Java and Ceylon; among the Fijians, and elsewhere in Oceania. And even within the limits of Christianity, we find the sect of the Ophites, who continued or renewed snake-worship, blended curiously with purer rites. It is evident, however, that although some animals may have received a preference, yet all had a share in the superstitious reverence of primitive peoples; and this broad universality of their worship militates against any other theory of its origin except that based on a belief in the free transmigration of souls from men to animals, and from animals to men, inherited from an early totem stage of society.

See Fergusson's *Tree and Serpent Worship* (1868); M'Lennan in the *Fortnightly Review* for 1869 and 1870; Herbert Spencer in the *Fortnightly* for 1870; chap. xv. of Tylor's *Primitive Culture* (1871); Gubernatis' *Zoological Mythology* (1874), for its facts; Robertson Smith in the *Journal of Philology* (1880); chap. vi. of Dornan's *Origin of Primitive Superstitions* (Philadelphia, 1881); two chapters in Lang's *Custom and Myth* (1884); and Lang's *Myth, Ritual, and Religion* (2 vols. 1887).

An'ima Mundi, according to many of the early philosophers, a force or vital principle immaterial, yet not intelligent; inseparable from matter, but giving it its form and movement, the source of all physical and sentient life. Plato held it impossible for pure spirit—the atmosphere in which alone eternal and archetypal ideas could exist—to bear any relation whatever to matter, and he therefore supposed the latter to be operated upon by an intermediate agency, the *anima mundi*. In the system of the Stoics, it was conceived to be the sole vital force in the universe; it usurped the office of pure spirit, and the doctrine became indistinguishable from Pantheism (q.v.). The notion does not seem to have been entertained by the schoolmen, but it reappears in the writings of Cornelius Agrippa, Paracelsus, and Van Helmont, and, in a modified form, was held by More and Cudworth. The latter recognised in 'plastic nature' the universal agent of physical phenomena. Amos Comenius found argument from Gen. i. 2 to prove that the spirit that 'moved on the face of the waters' still gives life to all nature. The doctrine of the immaterial *anima*, in matter, but distinct from it, was upheld by Stahl in 1720; but his term *animism* has now been adopted with a much wider signification by Dr Tylor and other anthropologists of the new school. See ANIMISM.

An'ime, a resin exuding from the trunk of the *Hymenæa courbaril*, a large tree of the natural order Leguminosæ, sub-order Cæsalpineæ, a native of New Spain and Brazil. It somewhat resembles copal, to which, in France, the name *résine animé* is applied, but is more easily soluble in alcohol.—The name anime, or gum anime, is, however, also given in Britain to a resin called in India copal, the produce of *Vateria indica*, a tree of the natural order Dipteracæ; whilst the copal of Madagascar is produced by *Hymenæa verrucosa*, and that of Brazil in great part by several species of *Hymenæa*, a tree of which genus is also regarded as the probable source of the copal of Mexico.

Animism, a term originally used to denote the theory of Stahl (q.v.), which regarded the vital principle and the soul as identical, but now used in the sense given to it by Dr Tylor as the general doctrine of spiritual beings. Dr Tylor takes the belief in spiritual existence as a minimum definition of religion. It appears among all low tribes with which we have any intimate acquaintance; and all travellers who have hitherto asserted the existence of races without it have been afterwards refuted by the facts. It may be considered to have arisen simply from the evidence of the senses, interpreted by the crude and childlike science of the savage. Two problems seem to have exercised the primitive mind. First, What is it which makes the difference between a living body and a dead one? what causes waking, sleep, trance, disease, and death? In the second place, What are those human shapes which appear in dreams and visions? The savage makes these two groups of phenomena each help to account for the other, by combining both in the conception of an apparitional or ghost soul, which is conceived of as an insubstantial human image, resembling a vapour or a shadow, the cause of life and thought in the individual it animates, capable of leaving the body and appearing to men waking or asleep as a phantasm separate from the body of which it bears the likeness, and able to enter into, possess, and act in the bodies of other men, of animals, and even of things inanimate. When the sleeper awakens from a dream, he believes that his soul has really been away, or that the souls of others have come to him. His body has been still, but his living self or soul, his phantom or image, has been active. And have

not waking men, in broad daylight, sometimes seen these human phantoms in what are called visions or hallucinations; and after a man has died and been buried, has not his phantom-figure continued to appear to the survivors in dreams and visions? And what is his reflection seen in still water, or his shadow falling behind him, or the breath seen for a moment issuing from his lips like a faint cloud, but the man's ghost-soul becoming visible for a moment and vanishing again? In the thought of the savage, as of the child, personality is ascribed not to men and beasts only, but also to things. His ghosts do not come to him naked, but dressed in the well-known clothing worn in life. This is the explanation of one of the most wide-spread rites of animistic religion—the offering of funeral sacrifices for the service of the dead. The phantasmal images of the objects offered pass into the possession of forms shadowy like themselves—the souls of the dead. These spiritual beings fill all nature, animate and inanimate, and their life is a continuation and not a new life in savage religion. They transmigrate into human beings, animals, plants, and lifeless things, and they can avenge their past and present wrongs by bringing disease upon the offender. The man keeps after death the temper he had in life, and is powerful for good or evil according to his inclinations while alive. From this, and not from mere family affection, arises naturally the ancestor-worship which has been from remote antiquity, and is still, the main faith of the larger half of mankind. Above the commonality of such spirits the primitive mind recognises higher spirits, or gods. Sometimes, by an extension of the natural order of life, the souls of great chiefs and warriors continue the same superior rank into the unseen world, and rise to divine honours. And the idea of the divine ancestor may even be carried far enough to reach supreme deity, as when the Zulus, working back from ancestor to ancestor, reach Unkulunkulu, the Old-old-one, as the creator of the world, thus attaining to monotheism by a natural evolution. In the most rudimentary stages of religion, ethical conceptions are but feebly developed, and there is little trace of moral retribution after death. The gods require their worshipper to perform his duty towards them, but do not necessarily concern themselves with his doing his duty to his neighbour. Yet the practical effect of religion on men's lives early begins to show itself. The worship of the dead naturally encourages good morals, for the ancestor who, while alive, saw that the members of his family did right by one another, and whose condition in the spirit-world is a continuation of his earthly character and rank, will naturally insist on this being continued when he is a divine ghost, powerful to favour or to punish. The world thus becomes regarded as the battle-ground of good and evil spirits, and from this follows naturally the idea of a dualism, or perpetual contest between good and evil, ranged under a supreme good and a supreme evil deity, which attains so great development in the ancient religion of Persia.

Animism, then, appears to the savage, on the evidence of his senses, to be a rational and fairly consistent philosophy, and it has maintained its place in higher civilisations. It is taught by Lucretius, when he makes his theory of film-like images of things (*simulacra* and *membrane*) account both for the apparitions which occur to men in dreams and the images which impress their minds in thinking; and when Democritus explained the facts of perception, by declaring that things are always throwing off images of themselves (*eidōla*), which enter the recipient soul, he was simply answering the fundamental question of metaphysics, by turning to a new purpose, as a method of explaining the phenomena of thought, the savage doctrine of object-

souls. Animism is not a degeneracy from a higher culture. In it we find no survivals which show inconsistencies with itself; whereas, in all higher cultures, there occur survivals of primitive superstition, wholly inconsistent with the more advanced beliefs. Most primitive superstitions are found surviving, in modified form, in poetry and folk-lore, and often in common words and phrases, which have a meaning deeper than metaphor. Animism is not itself a religion, but a sort of primitive philosophy, which not only controls religion, but the whole life of the natural man. It represents a stage in the religious evolution which is still represented by the so-called Nature-religions, or rather by the polydaemonic magic tribal religions, early developed among civilised nations into polytheistic national religions resting upon a traditional doctrine. See Tylor's *Primitive Culture* (2 vols. 1871), on which this article is mainly founded; also *The Origin of Primitive Superstitions*, by Rushton M. Dorman (Philadelphia, 1881).

Anio, the ancient name of the Teverone, a tributary of the Tiber, which rises in Monte Cantaro, and joins the larger river 3 miles above Rome. Its beautiful cascade at Tivoli (the ancient *Tibur*) is celebrated by the classical poets. Owing to the purity of the stream, Rome was from 270 B.C. supplied with water from it by means of two aqueducts.

Anise (*Pimpinella anisum*), an annual plant of the natural order Umbellifere. Two species are natives of Britain; they are commonly known by the name of Burnet Saxifrage, and have no properties of importance. Anise proper is a native of Egypt. It is cultivated in Egypt, Syria, Malta, and Spain, and even in Germany, especially in the district around Erfurt, where a large quantity of the seed is annually produced. Attempts were made, more than 200 years ago, to cultivate it in England; but the summers are seldom warm enough to bring it to perfection. It is occasionally sown in gardens for a garnish or for seasoning. Anise-seed (*aniseed*) is used as a condiment and in the preparation of liqueurs; also in medicine as a stimulant stomachic, to relieve flatulence, &c., particularly in infants. It has an aromatic, agreeable smell, and a warm, sweetish taste. Its properties are due to a nearly colourless or sometimes blue volatile oil, called *Oil of Anise*. *Anise-water*—water flavoured with the oil, and sugared—is much used in Italy as a cooling drink. The plant called anise in the New Testament is supposed to be *Anethum graveolens* (see DILL).

STAR ANISE, or **CHINESE ANISE**, is the fruit of *Illicium anisatum*, a small evergreen tree of the natural order Magnoliaceæ, somewhat resembling a laurel. It receives its name from the star-like form of the fruit, which consists of a number (6 to 12) of hard, woody, one-seeded carpels. It is held in high estimation by the Japanese, and planted near temples. The whole plant is carminative, and is used by the Chinese as a stomachic and as a spice in their cookery. The qualities of the fruit, seed, and oil closely resemble those of the common anise, and the oil is imported for the same purpose. Star aniseed is also imported, chiefly from China and Singapore.

Anjou, a former province in the NW. of France, of about 3500 sq. m. in extent, now forming the department of Maine-et-Loire, and small parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. It lies on both sides of the lower course of the Loire, where it receives the Maine. Its capital was Angers (Lat. *Andegavum*). The ancient inhabitants of Anjou were the *Andegavi*, who long and resolutely resisted the Roman arms. The first Count of Anjou was Fulk the Red, who was made count for his services against the North-

men in the 9th century. The male line of the ancient Counts of Anjou having become extinct in 1060, their title and possessions passed by the female line to the powerful House of Gatinais; and from one of this family, Geoffrey V., Count of Anjou, sprung the Angevin house of English kings, usually called Plantagenets, the last of whom was Richard II. Geoffrey conquered the greater part of Normandy, assumed the title of duke, and in 1127 married Matilda, the daughter of Henry I. of England, and widow of the Emperor Henry V. Through her, his son inherited the English throne, which he ascended in 1154 as Henry II. Anjou now became one of the possessions of the kings of England; but in 1205 the French acquired it by fortune of war; and it was bestowed as a fief upon Philip, the son of Louis VIII., and afterwards upon his brother Charles, who became the founder of that house of Anjou which gave kings to Naples and Sicily. Charles II. of Naples gave Anjou to his daughter Margaret on her marriage with Charles of Valois, the son of Philip IV. Her son ascended the throne of France as Philip VI. in 1328. King John in 1360 made Anjou a duchy, and gave it to his son Louis, and on his succeeding to the crown of Naples, it remained a possession of the kings of Naples till the overthrow of that dynasty under René II., when Louis XI. permanently annexed it to the French crown (1484). Subsequently it gave merely an honorary title to princes of the royal family—as, for example, the grandson of Louis XIV., who became Philip V. of Spain. Anjou was united with England for a short time during the reigns of Henry V. and Henry VI.—the latter king ceding it finally in 1444.

Ankarström, JOHN JACOB, the assassin of Gustavus III. of Sweden, born in 1762. The son of an officer of rank, he came very early to court as a page, and next entered the royal body-guard, but retired as early as 1783, and settled in the country. Being opposed to the measures taken by the king for curtailing the power of the senate and of the nobles, he became involved in certain intrigues in the island of Gothland, and was tried for treason, but released for want of positive evidence. Soon after he formed a plot with a ring of discontented nobles to murder Gustavus, and the lot to commit the dastardly deed having fallen on Ankarström, the old life-guardsmen wounded the king mortally with a pistol-bullet at a masked ball on the 15th March 1792. Ankarström was executed on the 27th April, after having been publicly flogged for three successive days.

Anker, a Dutch liquid measure, formerly often referred to in England, containing ten wine gallons.

Anklam, a town of Prussia, in the province of Pomerania, on the navigable Peene, 4 miles from its mouth in the Kleines Haff, and 41 miles SE. of Stralsund by rail. It has long been a place of commercial importance, having been a member of the Hanseatic League from the 14th to the 16th century. It has manufactures of iron, sugar, and soap. During the middle ages, Anklam suffered sorely from fire and pestilence; and in the wars of the 17th and 18th centuries it was again and again besieged and sacked. On the close of the Seven Years' War in 1762, its fortifications were dismantled. There is a military school here. The town contains many interesting specimens of the Hanseatic architecture, very like the Flemish. Pop. (1875) 11,847; (1885) 12,784.

Anko'bar, the capital of the kingdom of Shoa, in Abyssinia, is built 8200 feet above sea-level, and consists of 3000 huts scattered over the summit and western slopes of a mountain. When the king is in residence the population is increased from 6000 to near 15,000.

Ankylo'sis (Gr. *ankylōsis*, 'bending' or 'crooking'; *ankylē*, 'stiff-joint') is a term used in surgery to imply a stiffness in any joint. It is usually the result of disease, which destroys either the articular cartilages, leaving two bony surfaces opposed to each other, to become united by subsequent formation of bony or fibrous tissue, or thickens and shortens the natural fibrous tissues around the joint. Severe injury may also lead to a similar result. If the bond of union be osseous, the joint is perfectly rigid; if fibrous, it may allow a certain amount of motion. Some joints, especially the elbow, are very apt to become ankylosed; and in the knee or hip-joints, osseous ankylosis, with the limb in a proper position, is frequently the most favourable termination to disease, as the limb can then afford a rigid support for the trunk. Joints, stiff through a fibrous ankylosis, may be forcibly bent, and the bond of union ruptured, so as to restore mobility, or allow of their being placed in a convenient position. In some joints, especially the elbow, ankylosis may be remedied by excision of the joint. Ankylosis of the joints between the ribs and the vertebrae is common in advanced age; and there are some cases on record of universal ankylosis of all the joints. A case occurred in 1716 of a child only twenty-three months old with all its joints thus stiffened; and there are in various museums specimens of adult bodies in this condition.

Ann, or **ANNAT**. See **ANNATES**.

Anna, or **ANNE**, **ST**, according to tradition, wife of St Joachim, and mother, after twenty years of barrenness, of the Virgin Mary, the mother of Jesus. The first to mention her is St Epiphanius, in the 4th century; but towards the 8th, we find her all but universally held in honour. Her body is said to have been transferred from Palestine to Constantinople in 710; and since that time many churches have boasted of relics of her person, no less than three having equally good claims of having her head. She is the patron-saint of carpenters. Her festival falls on the 26th of July; with the Greeks, on the 8th of December. St Anne d'Auray, in Brittany, is a famous place of pilgrimage; and St Anne de Beaupré, near Quebec, is its counterpart in the New World.

Anna, an Indian coin, value nominally 1½d. sterling, but always the sixteenth part of a rupee.

Annaberg, a mining town of Saxony, on the northern slope of the Erzgebirge range, 34 miles S. of Chemnitz by rail. It is situated 1800 feet above sea-level, in a mining district; the surrounding hills containing mines of silver, tin, cobalt, and iron. It has extensive manufactures of lace, silk ribbons, corsets, and buttons. The ribbon manufacture was introduced here by Protestant refugees from Belgium in 1590. The mining industry was more important in the 16th century. Pop. (1885) 13,822.

Anna Carlovna, regent of Russia during the minority of her son Ivan, was the niece of the Empress Anna Ivanovna (q.v.), and in 1739 married Anton Ulrich, Duke of Brunswick-Wolfenbüttel. Her son Ivan, born in 1740, was nominated by the Empress Anna as her successor; and Anna Carlovna proclaimed herself regent, but showed no capacity. A conspiracy took place in 1741; the infant Ivan was murdered; and Anna and her husband were imprisoned at Cholmogory. Here she died in 1746; while Anton was confined till his death in 1776.

Anna Comnenē, a learned Byzantine princess, author of one of the most valuable of the Byzantine histories, was the daughter of the Emperor Alexius I. (Comnenus), and was born on December 1, 1083. She received the best education that

Constantinople could give, and early displayed a fondness for literary pursuits; but was also habituated from her childhood to the intrigues of the court; and during the last illness of her father, she entered into a scheme, which her mother, the Empress Irene, also favoured, to induce him to disinherit his eldest surviving son, John, and to bestow the diadem on her. Failing in this, she framed a conspiracy against the life of her brother (1118); and when her husband, Nicephorus Bryennius, a Byzantine nobleman, either from timidity or virtuous principle, refused to join in it, she passionately lamented that she had not been born a man, and upbraided him for having the soul of a woman. Her brother spared her life, but confiscated her property, which, however, he soon after generously restored. Disappointed and ashamed, she withdrew from the court, and sought solace in literature. On the death of her husband (1137), she retired into a convent, where she died in 1148. Her life of her father, entitled *Annae Comnenae Alexiadis libri XIX.*, is full of professions of careful inquiry and a supreme regard for truth, the effect of which is weakened by 'the perpetual strain of panegyric and apology.' The style is characterised by an elaborate affectation of rhetoric. The best edition is that of Schopen and Reifferscheid (2 vols. 1839-78). See Oster's *Anna Comnena* (3 vols. 1868-71).

Anna Ivanovna, Empress of Russia, born in 1693, was the second daughter of Ivan, elder brother of Peter the Great. She married in 1710 the Duke of Courland, who died in the following year; and she obtained the duchy of Courland for her favourite, Biron (q.v.), a Courlander of low birth. The throne of Russia was offered to her by the Supreme Council on the death of Peter II. in 1730, on conditions which greatly limited the power of the monarchy, but which she soon broke. She declared herself autocrat, and suppressed an attempt of the nobles to establish a constitutional government; and her paramour, Biron, having determined to govern the nation as well as the empress, established a reign of terror through the land. He is said to have banished not less than 20,000 persons to Siberia; many were broken on the wheel. Prince Dolgoruki and others of the highest rank perished on the scaffold. Anna died in 1740, and left the throne to her grand-nephew, Ivan.

Annals. These were at first books which contained a record, in chronological order, of the principal events occurring in one or more years. The name is derived from the oldest historical documents of the Romans, the *Annales Pontificum*, or *Annales Maximi*, the duty of drawing up which devolved upon the *Pontifex Maximus*; but these were all destroyed by the Gauls at the sack of Rome, nearly four hundred years before the time of Christ. After the second Punic War, the *Annales Gentium* and *Annales Consulares*, of families or individual public men, continued to be composed by educated members of the Roman laity, such as Fabius Pictor and Calpurnius Piso. At a still later period, the term was applied to any historical work that followed the order of time in its narrations, separating them off into single years—as, for instance, the *Annals* of Tacitus.

Annam, a territory along the east coast of Indo-China, between 10° and 23° N. lat., forming an empire which, since 1885, has been under a French protectorate. The names Annam and Cochinchina are sometimes used as interchangeable; sometimes the whole region is Annam, with Tongking (Tonquin) and Cochinchina as subdivisions; and conversely, sometimes Cochinchina has Tongking and Annam for its northern and southern

sections. Cochin-China was the name originally given by the early navigators to the whole coast from Siam to China. Annam, a name given by the Chinese in the 3d century A.D., was adopted by the Annamese as the official name for the whole country. Including Tongking—till recently a feudatory state—Annam is bounded on the north by the Chinese provinces of Kwangtung, Kwang-si, and Yunnan. On the west, the precise frontier of Annam is still undetermined, but may be taken generally as formed, in the northern section, by the mountain-range skirting the left bank of the Mekhong, but farther south, extending beyond that coast-range to about 106½° E. long. On the S., Annam is bounded by Lower Cochin-China; on the E., it is washed by the China Sea. The area of Annam is estimated at about 106,000 sq. m., and its population at about 21 millions. It consists of three main parts—the northern part, Tongking, or Tonquin (i.e. 'Eastern land'), occupying from 60,000 to 70,000 sq. m., with a population of about 12 millions; Dang-kong ('interior land'), or Annam Proper, south of Tongking; in the extreme SE., Champa or Tsiampa. In addition to these sections, Annam includes the domain of the Moi, or hill-tribes (called by the Siamese, Kha), differing from one another in type, speech, and usages, situated to the west of the Dang-kong; as also the territory of the Laos, subject to Annam, lying north of Cambodia and the Mekhong. French, or Lower Cochin-China, to the south of Annam, consisting of six provinces, was in 1863 detached from Annam, and is now under the administration of the French Marine Department. Cambodia, occupying the lower course of the Mekhong, to the SW. of Annam, was, till recently, under the vassalage of Siam; but since the French occupation of Lower Cochin-China, Cambodia too has detached itself from Siam, and declared allegiance to the French.

Tongking, placed by the treaty of Hué (1884) along with Annam Proper under the protection of France, is distributed into three distinct natural divisions—(1) the delta-land in the SE.; (2) the region of plateaus in the north; and (3) the forest region in the west. The Song-coi, or Red River (called Thao by the Annamese, and Hong-kiang by the Chinese), flows across the whole of Tongking from NW. to SE. The delta-lands formed at its mouth may be defined as a rough insular triangle, the apex of which is Son-tay, and its two sides, Song-dai on the south, and Song-can on the north, both issuing into the sea. Not far below Son-tay the Song-coi opens out at intervals into four leading branches, of which one is navigable for large ships. These main water-ways are connected by a network of subsidiary channels—many natural, some in part artificial. The delta-lands are all crossed by great embankments or dykes, hundreds of miles in extent, often 60 to 70 feet wide at the base, 20 to 30 feet high, and broad enough at the top for three carriages to drive abreast. The delta-lands are extremely fertile, yielding two harvests a year. This fertility is due to the red soil which is transported by the Song-coi (Red River), and which is rapidly enlarging the delta. Hanoi, a seaport when built by the Chinese in the 8th century, is now 100 miles inland. Now, too, there are populous agricultural villages where, 20 years ago, fishermen were casting their nets. The staple product is rice; but there are also grown pea-nuts, castor-oil, mulberry for silkworms, cotton, sugar-cane, spices, sweet potatoes, &c. The north of Annam is rich in minerals of all kinds, and there have been opened gold, silver, copper, tin, and salt mines, while extensive coal-fields have hardly yet been touched.

The mountains are covered with all kinds of useful woods.

Though Annam lies wholly in the torrid zone, yet the climate of Tongking is on the whole excellent. During the dry season, from September to April, the thermometer varies between 70° and 40° F. During the hot and rainy season, extending over the other six months, the thermometer seldom mounts from a minimum of 70° to beyond 100° F. On account of the moisture, however, the heats in June and July are sometimes almost intolerable. In the mountains of Annam, tigers, buffaloes, rhinoceroses, and elephants abound. Much fishing is carried on.

Inhabitants.—The Annamese are mainly of Mongoloid stock. The inhabitants of the mountains (Muong or wild people) are taller, fairer, and stronger than the inhabitants of the plain. The latter are small of stature, but well proportioned, indolent, but expert. Rice is their principal food; but, like the Chinese, they are omnivorous, and devour snakes, locusts, rats, and dogs. The Tongkingese display wonderful skill in building dykes. Yet at Haiphong, the Chinese have monopolised all the industries demanding skill and perseverance; and 'lazy as an Annamese' is a common proverb. The only good industries carried on in Annam are in lacquer and the finer metals. The manufacture of steel is unknown. Sericulture and silk-weaving are far behind the state attained by those arts in China. The dykes offer the most available roads, and the only two great highways are the route from Saigon through Hué to Hanoi, and by way of Bac-ninh and Lang-son to China; and the northern road from Hanoi to Son-tay and Hung-hoa. The speech of the Annamese is monosyllabic, like Chinese, from which they have borrowed many words. The Annamese written character was also derived at an early period from the Chinese alphabet. There is no Annamese literature distinct from the Chinese. The mass of the people worship tutelary spirits; Confucianism is in vogue with the more cultivated; the remainder adhere to Buddhism. There are besides about 420,000 Roman Catholics, descendants of emigrants from Macao and Japan (1624), and of Portuguese fugitives from Malacca.

Government.—The frame of government is of Chinese pattern, but in its operation is much harsher and ruder than its prototype. The emperor is absolute despot, and unless the actual monarch should have decreed otherwise, the succession passes to the eldest son. He is assisted by a council of six ministers and three 'kun,' one of whom is prime-minister. The bastinado is in full force, and mutilation and torture are regular instruments of arbitrary authority. Military service is obligatory on all men between the ages of 18 and 60; and they are so often called out, that the field-work is left principally to women. The capital of the empire is Hué.

History.—Tongking and Cochin-China were, 214 B.C., conquered by China, and occupied by Chinese colonists. In 939 A.D. Tongking freed itself from the yoke of China, and in 1403 a war commenced, which in 1428 ended with Annam's independence of China, although the latter still maintained a nominal suzerainty. In 1517 the Portuguese came into the country, followed by the Dutch, who established a trading settlement in Hanoi. In 1789, by the aid of the French, the emperor of Annam united Tongking and Cochin-China under his rule. In 1858 a Franco-Spanish squadron stormed Touron, and next year Saigon likewise surrendered. In 1861 the whole province of Saigon submitted to France. Other provinces soon fell, and by the treaty of Saigon or Hué (1862) 'French Cochin-China' was established, and afterwards enlarged.

In 1870 Dupuis made a voyage up the Sang-coi as far as Yunnan; and in 1873, with 100 French soldiers, captured Hanoi. By commercial treaty (1874) with Annam, France secured the right of holding the delta-lands of Song-coi, and freeing them from pirates. Accordingly, in 1882, Major Rivière made himself master of Hanoi, and, notwithstanding the protests of China, Annam, by treaty on the 25th August 1884, acknowledged the suzerainty of France, and her right to regulate the relations of Annam with foreign powers, China included. After some conflicts with France, China also, by the treaty of Tien-Tsin, 9th June 1885, engaged to respect the new state of affairs introduced by France into Annam, and to sanction commercial relations between China and Tongking. Thus practically the whole of Annam, including Tongking and Cochin-China, has been made a dependency of France.

See recent works on *Annam* and *French Cochin-China* by Bouillevaux, De Rhins, Lemire, Launay; and works on the French colonies by Vignon, Rambaud, and De Lanessan (1886).

Annamaboe, a small seaport town, protected by a strong British fort, on the Gold Coast of Africa, 10 miles E. of Cape Coast Castle. It has a good landing-place, and is a free port, but there is little trade. Pop. 5000.

Annan, a small seaport, and royal and parliamentary burgh, in Dumfriesshire, on the river Annan, near its entrance into the Solway Firth, 18 miles ESE. of Dumfries by rail. It is neat and well built; among the chief industries are tanning and bacon-curing. Edward Irving was a native; and Carlyle, as a schoolboy, led 'a doleful and hateful life' at the academy. The burgh unites with Dumfries, &c. in returning one member to parliament. Pop (1881) 3366.

Annapdale. See DUMFRIESSHIRE.

Annap'olis, a seaport of Nova Scotia, on an arm of the Bay of Fundy, 95 miles W. of Halifax by rail. Its harbour is large and sheltered, though somewhat difficult of entrance. Annapolis is the oldest European settlement to the north of the Gulf of Mexico, having been established, in 1604, by the French as the capital of their province of Acadia, under the name of Port Royal. Acadia was ceded to Britain by the French in 1713, when Port Royal changed its name in honour of Queen Anne, continuing to be the seat of government, till in 1750 it was superseded by the newly founded city of Halifax. Pop. (1880) 2833.

Annapolis, the capital of Maryland, U.S., stands on the south bank of the river Severn, 2 miles from its entrance into Chesapeake Bay, and 40 miles E. by N. of Washington by rail. It has an air of quiet seclusion, more like a European town than an American city. Among its edifices are an imposing state-house, St John's College (1784), a Roman Catholic seminary, a naval hospital (1871), and a United States naval academy, established in 1845. Pupils remain in this institution for four years, previous to examination and admission into the navy as midshipmen. Founded as Providence in 1649, Annapolis received its present name in honour of Queen Anne. Pop. (1870) 5744; (1880) 7000; (1887) about 10,000.

Annap'olis, a flourishing city of Michigan, capital of the county Washtenaw, on the Huron River, 38 miles W. of Detroit by rail. It was settled in 1824, and incorporated as a city in 1851. The state university, founded 1837, possesses a good library, a notable observatory, and a laboratory. There are about 90 professors and lecturers and 1500 students, and the income from grants and fees is about £46,000. There are several faculties, and, as in Europe, examinations for

degrees are conducted on work done out of class. The city has an active trade, and contains manufactures of carriages, furniture, paper, woollen goods, blinds, and ploughs. There are mineral springs and a hydropathic establishment. Pop. (1870) 7363; (1880) 7849, about one-fourth of whom are of German descent.

An'nates, or **FIRST-FRUTTS**, in the ecclesiastical law of England, meant the value of every spiritual living for a whole year, which the pope, claiming the disposition of every spiritual benefice within Christendom, reserved out of every living. This impost was at first only levied from persons appointed to bishoprics, but was afterwards extended to the inferior clergy. It was abolished in 1534, and in the following year the right to annates was annexed to the crown. The fund thus arising was administered for the benefit of the Church of England. It was transferred to the governors of Queen Anne's Bounty, and afterwards to the Ecclesiastical Commissioners. For the purposes to which it is now applied, see ECCLESIASTICAL COMMISSIONERS.

ANNAT, or **ANN**, in Scots law, signifies the half-year's stipend payable for the vacant half-year after the death of a clergyman, to which his family or nearest of kin have right, under an act of the Scottish parliament passed in the year 1672. It is a right that does not belong to the clergyman himself, but to his next of kin absolutely, and therefore can neither be assigned or disposed of by him nor attached for his debts.

Annatto, or **ANATTA**, also known in commerce as *Arnatto*, *Roucou*, and *Orleana*, is the reddish pulp surrounding the seeds of the *Bixa orellana*, a medium-sized tree growing in Guiana and other parts of South America. The fruit having been bruised and macerated with water, the juice is allowed to stand till the colouring matter subsides to the bottom (an operation hastened by the addition of vinegar), when it is strained and the residue dried. Sometimes fermentation is allowed to take place, when an article superior for dyeing purposes, but having a disagreeable odour, is produced. Annatto is used in the dyeing of cloth, to which it imparts a bright orange tint, of slight permanence, however; and it also enters into some bright-coloured varnishes. It is in the manufacture of butter and cheese that it finds its widest application, although its value in this respect is purely a sentimental one, depending on the taste for a high-coloured article. As met with in this country, it contains flour, chalk, and other foreign substances, which, however, can hardly be regarded as adulterants, being necessary to adapt the crude article to its various uses.

Anne, Queen of Great Britain and Ireland, and the last British sovereign of the House of Stuart, was born at St James's Palace, London, on 6th February 1665. She was the second daughter of James II. of England and VII. of Scotland (who at the time of her birth was Duke of York), by his first wife, Anne Hyde, the daughter of the famous Earl of Clarendon. When she was six years of age, her mother died; and her father soon after professed himself a member of the Church of Rome; but his daughters were educated in the principles of the Church of England, to which Anne always retained an ardent if not a very enlightened attachment. In 1683 Anne was married to Prince George of Denmark (1653-1708), an indolent and good-natured man, who concerned himself little about public affairs, and had as little capacity for dealing with them. Soon after her marriage, the wife of Colonel Churchill (afterwards the famous Duke of Marlborough) was appointed one of the ladies of her bed-chamber. As the queen

needed some one on whom she could lean, Lady Churchill speedily became her intimate friend, and acquired supreme influence over her, which she exerted in favour of her husband. In their correspondence with each other, Anne went by the name of Mrs Morley, and Lady Churchill by that of Mrs Freeman. During the reign of her father, Anne lived in retirement, taking no part in politics. On the landing of the Prince of Orange, she soon joined his party, the Churchills having decided on that step. She consented to the act by which the throne was secured to the Prince of Orange in the event of his surviving her sister Mary; but quarrelled with her sister about questions of etiquette, and was afterwards drawn into intrigues in which the Churchills were engaged, for the restoration of her father, or to secure the succession of the throne to his son. She even entered into a secret correspondence with her father. She was herself childless when, on the death of William III., on 8th March 1702, she succeeded to the throne. She had borne, indeed, seventeen children; but only one, the Duke of Gloucester, survived infancy, and he died in 1700, at the age of 11. The influence of Marlborough and his wife was most powerfully felt in all public affairs during the greater part of her reign. The strife of parties was extremely violent, and political complications were increased by the queen's anxiety to secure the succession for her brother. In so far as she had any political principles, they were opposed to that constitutional liberty to which she owed her occupancy of the throne. These principles and her family attachment tended to alienate her from the Marlboroughs, whose policy, from the time of her accession, had become adverse to Jacobitism, and who now, along with Godolphin, were at the head of the Whig party. The duchess also offended the queen by presuming too boldly and haughtily upon the power which she had so long possessed. In 1710 they parted, never to meet again. Anne found a new favourite in Mrs Masham, a cousin of the duchess, who herself had introduced her into the royal household. To Mrs Masham's influence the change of government in 1710 was in a great measure owing, when the Whigs were cast out, and the Tories came into office, Harley (afterwards Earl of Oxford) and St John (Lord Bolingbroke) becoming the leaders of the ministry. But, although concurring more or less in a design to secure the succession of the throne to her brother, the new ministers had quarrels among themselves which prevented its successful prosecution, and kept the poor queen in a state of constant unrest. She died 1st August 1714. The Elector of Hanover succeeded her as George I.—The public events of her reign belong to the history of Britain; but the union of England and Scotland, in 1707, may be mentioned in its personal relation to herself, as she was the last sovereign who reigned over these as separate kingdoms, and the first sovereign styled of Great Britain.—Queen Anne was of middle size, and comely, though not beautiful. She was virtuous, conscientious, and affectionate, more worthy of esteem as a woman than of admiration as a queen. Her reign is often mentioned as a period rendered illustrious by some of the greatest names, both in literature and science, which this country has ever produced; but literature and science owed little to her active encouragement.

Anne Boleyn. See BOLEYN.

ANNE OF AUSTRIA, daughter of Philip III. of Spain, was born in 1601, and in 1615 became the wife of Louis XIII. of France. The marriage was so far from being a happy one, that the royal pair lived for twenty-three years in a state of virtual separation—a result due chiefly to the influence of

Cardinal Richelieu, whose fixed determination to humble the House of Austria led him to spare no means for alienating the affection of Louis from his queen. On the death of the king in 1643, Anne became queen-regent, but disappointed the parliament and the nobility, who had hoped to secure again their ancient authority, by choosing as her minister Cardinal Mazarin, under whose strong and skilful management the young king (Louis XIV.) came, on attaining his majority, into possession of a throne firmly established on the ruins of contending parties. The character of Anne had much influence in moulding that of her son. She had, however, no capacity for actually managing affairs, and on the death of Mazarin, retired to the convent of Val de Grace, where she died in 1666.

Annealing. When a slab of glass or metal is allowed to cool down rapidly from its melted state, the constituent particles near the surface become differently arranged from those in the interior. The molecules next the skin are in a different state of tension from those inside. Annealing is a process of slow cooling of a body from a high temperature, by which there is secured a more or less uniform arrangement of the particles or molecules throughout its mass. Glass is in this way made strong and able to resist changes of temperature. The mere dropping of a small angular fragment of some hard substance, such as flint, into a glass vessel before it is annealed, usually makes it fly to pieces. A still more striking example of the unstable nature of unannealed glass is seen in Prince Rupert's drops. These are drops of glass which have fallen in a melted state into cold water, and have assumed a tadpole-like shape. If the point of the tail of one of these be nipped off with the fingers, the whole of it will fall into dust with a loud explosion. This shows that whenever the skin is broken, the particles beneath it are acted on by a repellant force, and fly away from one another.

An annealing kiln or oven is usually of some length, and the glass vessels or sheets placed in it are raised to near their melting-points at its hottest portion, and then moved away at intervals to cooler and cooler parts of the chamber. It takes twelve hours to anneal wine-glasses, but much longer for large objects. Plate-glass requires to be two weeks in the kiln before it is properly annealed. Badly annealed glass shows itself in numerous ways. A basin of thick glass left in an ordinary room will sometimes break spontaneously during a cold night. Plates of glass placed, on account of their apparent strength, in floors to admit light to cellars, have occasionally cracked to pieces during sharp frost. Hot water, as is well known, often breaks tumblers.

Metals under various circumstances require to be annealed. Hollow ware (q.v.) of cast-iron, before it can be turned bright for tinning, must be softened by the annealing process. The old way of doing this was a rough and ready one. Large and strong iron pots which contained the ware were placed on gratings in the open air, and the whole covered over with coke, all interstices both within and without the pots being filled up with coal-dust, to prevent as far as possible the access of air. The coke was then fired and kept at a red heat for about twenty-four hours, after which the pile was allowed to cool. For many years, however, hollow ware has been annealed in an oven not much unlike that used for glass. Large iron-castings are kept covered up in their moulds, to prolong the time of cooling—sometimes with hot cinders—for a month or more. Like thick glass, these occasionally break spontaneously.

What are called malleable-iron castings are articles usually of limited size, made of cast-iron, which are afterwards annealed. They are covered over with powdered hæmatite ore, and subjected to

various degrees of heat for about ten days, when they become quite malleable.

Metals, when undergoing the process of rolling, hammering, or stamping, require annealing. In the manufacture of sheet-brass, the rolling, by which it is gradually reduced in thickness, makes it so hard that it has to be annealed several times during the operation. But in this case the annealing is conducted in a reverberatory furnace, and lasts only a few minutes. The sheet-brass is simply raised to a blood-red heat and then withdrawn, this being sufficient to restore the ductility of the metal. Articles made of brass and other metals by stamping, and particularly such articles as require many blows of the stamp to bring them into shape, are repeatedly annealed during the process. In the case of coins, as they receive only one blow of the coining-press, the metal blanks are annealed before they are stamped. A steel matrix, from which die-punches are impressed, being usually a work of much labour, is put through the annealing process after every few blows in the die-press. German silver, which is composed of three kinds of metal, is difficult to anneal from its tendency to crack in the process.

Annealing is also used in gold-beating, in wire-drawing, in nail-making, and many other arts. Tin, lead, and zinc are annealed by the use of boiling water, and steel tools by immersion in hot oil, both liquids being allowed to cool slowly. Many experiments have shown that steel boiler-plates and ship-plates are made stronger by annealing them in oil, or in melted lead, or by simply heating them to redness in a slow furnace, and afterwards covering them up with sand or ashes to prevent them cooling rapidly or unequally. Tempering (q.v.) has been called the inverse process of annealing.

Annecey, chief town of the French department of Haute-Savoie, at the north-western extremity of the Lake of Annecey, 22 miles S. of Geneva, and 25 miles NW. of Aix-les-Bains by rail. The Lake of Annecey, 1426 feet above the sea, is about 9 miles long; its waters flow by the Fier to the Rhone. Annecey was transferred with Savoy to France in 1860. It has manufactures of linens, cotton-yarn, silks, straw goods, and steel wares. The most remarkable buildings are the castle, once the residence of the Counts of Geneva, and now a barrack; the old bishop's palace; the cathedral (1523); the hôtel-de-ville, with a statue near it of Berthollet (q.v.) by Marochetti; and the modern church of St Francis, which possesses relics of St Francis of Sales. Here Eugene Sue died in exile. Pop. (1881) 10,740.

Annelida (Lat. *anellus*, 'a little ring'), a term due to Lamarck, and definitely applied by Cuvier to the higher red-blooded worms. The term is no longer generally used in classification, but where it does persist, it usually includes the three classes—Chaetopoda, Discophora, and Gephyrea. See WORMS.

Annexation is the adding or joining to a state of territory which was previously independent or in possession of another power. It is generally, though not always, the result of war. As important annexations in recent times may be mentioned that of Oudh in 1856, which was one of the causes of the Indian mutiny; that of Savoy by France after the war with Austria in 1859; that of Alsace-Lorraine by Germany in 1871; that of the Bolivian seaboard and part of Peru by Chili in 1884; and that of Upper Burmah by Britain in 1886.

Annobon, or ANNABON, the smallest of the four islands in the Bay of Biafra, the eastern part of the Gulf of Guinea, now belonging to Spain. Its volcanic mountains render it picturesque, and it is well wooded and fertile. It has

an area of over 6 sq. m., and a pop. of about 1600 negroes, who profess to be Catholics. The island was discovered by the Portuguese on New-Year's Day (*Anno Bom*), 1471.

Annonay (ancient *Annoniacum*), a town of the department of Ardèche, France, 37 miles S. of Lyons. The chief manufacture is that of paper; there are also manufactures of gloves, silk and cotton twist, and woollen cloths; and bleaching is carried on. The paper-mills of Annonay were established by the father of the celebrated aeronauts Montgolfier (q.v.), who were born here. The situation of the town is picturesque. Pop. (1881) 14,891.

Annual, a term applied to plants which complete the whole course of their development in one season, within which they germinate, flower, perfect their seeds, and perish, never to spring again from the same root. The whole duration of life in the plants thus designated is indeed generally much less than a year, and in temperate and cold climates falls within the brief period of the summer months. Some species are generally annual, and others generally biennial; but whether an individual plant is annual or biennial often depends upon the accidental circumstance of the season at which the seed germinates, and may therefore be artificially determined by the time of sowing. Peculiar circumstances also sometimes convert annual into biennial, or even perennial plants; and those which are mere annuals in one climate, are perennial or even shrubby in another—e.g. the Castor-oil plant. Most kinds of corn are the produce of annual grasses; some of which, however, as wheat, in certain circumstances, prove of longer duration. The *annuals* cultivated in our flower-gardens are very numerous; and many species, both native and foreign, are among our most beautiful flowers.

In Gardening, annuals are divided into three classes—viz. *hardy*, *half-hardy*, and *tender*. The last named are those which can only be cultivated in the temperature of a stove or greenhouse, and consist of such as the Cockscomb (*Celosia cristata*), the Melon (*Cucumis melo*), and many others. The half-hardy class consists of those kinds that, while they will flower and perhaps perfect their seeds in the open air, need the assistance of artificial heat and protection in the early stages of their growth. The China Aster (*Callistemma hortense*), Tobacco (*Nicotiana tabacum*), Drummond's Phlox (*Phlox drummondii*), and Marigold (*Tagetes*), are familiar examples of this class of annuals. The first named or hardy class is composed of those that may be sown in the open ground, and will germinate and flourish from first to last without any artificial protection or aid. Nemophila Lupine (*Lupinus nanus* and others), the Large-flowered Flax (*Linum grandiflorum*), Candytuft (*Iberis umbellata* and others), the various Godetias, Gilias, and the Rocket Larkspur (*Delphinium ajacis*), are well-known members of the hardy group. So hardy are many of these that they may be sown in autumn and bloom the following spring, thus greatly prolonging the enjoyment of the flower-garden, as these will last in bloom till the ordinary spring-sown plants come in.

Californian annuals are unquestionably the most valuable for those who must rely solely on hardy flowers for the adornment of their gardens.

Annual Register, a yearly record of public events, which was commenced in 1759, and has been continued to the present time. It was projected by Robert Dodsley the bookseller, and for nearly thirty years Edmund Burke wrote the survey of events. Indexes have been published at various periods, and the work is now published by Messrs Rivington. Preceding works of the same kind were Boyer's *Political State of Europe* (1711-39),

and the *Historical Register*, a quarterly (1716-38). A rival work, entitled *The New Annual Register*, was started in 1781 by Dr Kippis. It was edited after his death by Dr Morgan, and came to a close in 1825. The *Edinburgh Annual Register* (1808-27) had among its contributors Sir Walter Scott and Southey. The *French Annuaire Historique* (1818-49) was superseded by the *Annuaire des Deux Mondes*, a publication connected with the well-known review of that name.

Annuals, the name given to a class of sumptuous books, much in demand during the first half of the present century, for Christmas, New-year, and birthday presents. They were usually illustrated with good engravings, and often contained prose and poetry by most of the best writers of the day. The first of them, the *Forget-me-not*, was begun in London in 1822. The following year, two others made their appearance, *Friendship's Offering* and *The Graces*, the latter containing a series of elegant poems on the Months by the Rev. Dr Croly. The *Literary Souvenir*, however, commenced in 1824 by Mr Alaric A. Watts, was the first really beautiful book of this kind, and after its appearance the annuals became every succeeding year more and more attractive. It was followed by the *Amulet*, started by Mr S. C. Hall, and edited by his wife; the *Winter's Wreath*, a provincial annual; and the aristocratic *Keepsake*, commenced in 1827 by Mr Charles Heath, an eminent engraver. The last was published at a guinea, instead of the usual twelve shillings of former annuals, and was throughout one of the most successful of its class. Its first editor was Mr W. H. Ainsworth, and among his successors were Lady Emmeline Stuart Wortley and the Countess of Blessington. In its second year, Scott refused the editorship at a salary of £800, but had £500 for a few contributions. The first volume of the *Book of Beauty*, begun in 1833, and long one of the best of the series, was written by Letitia E. Landon; its second and all succeeding issues by the Countess of Blessington. Other annuals were the *Picturesque Annual*, *Hood's Comic Annual*, the *Children of the Nobility*, the *Juvenile Album*, the *Musical Bijou*, the *Drawing-room Scrap-book* (the last edited at first by Letitia E. Landon, afterwards by Mrs Howitt, and latterly by Mrs Norton), the *Juvenile Scrap-book*, the *Oriental Annual*, the *Historical Annual*, the *Gift*, and the *Token*; the last three, American productions. For several years, nearly £100,000 per annum was expended on the production of annuals, and 150,000 copies of them were yearly sold. The sale of the *Forget-me-not* alone was at one time 20,000 copies. In 1829 no fewer than seventeen were published. In 1840 their number had dwindled to nine. From this time the demand for the annual steadily declined. Publishers no longer found them safe speculations, and gradually discontinued them. They dropped out, one by one, like spent rockets, from the literary firmament. The *Literary Souvenir* had been discontinued in 1834, after the publication of ten volumes. The *Forget-me-not*, the first in the field, saw its twenty-second year. The *Book of Beauty* and the *Keepsake* (of 1856) were the last of their race. Innumerable *Christmas Annuals* are now published; but these are cheap collections of tales and poems, illustrated with woodcuts. They are accordingly quite unlike the old annuals, and are similar to the extra Christmas numbers issued by many of the monthly magazines.

Annuity is the term employed to describe a payment generally (but not necessarily) of uniform amount falling due in each year during a given term, such as a period of years or the life of an individual; and payable, either in one sum at the

end of the year, or by half-yearly or other instalments. Annuities differ from other investments in this, that the capital sum invested or 'sunk' in the purchase of the annuity is not returnable when the annuity ceases to be payable—a portion of it is, in fact, returned in each payment of the annuity. By thus sacrificing the capital, a larger income is obtained, and hence the purchase of a life annuity is resorted to by persons whose main object is to secure a competency for themselves. For example, a male aged 60, by paying £1000 to the government, can secure an annuity of £87, 1s. 8d. for the remainder of his life, while the same sum invested in consols at par would yield £30 only. Annuities are divisible into two classes: (1) *Annuities certain*—that is, for a fixed term of years, subject to no contingency whatever, and depending for their value simply upon the operation of compound interest; and (2) *Annuities contingent*—that is, annuities depending not merely upon the operation of compound interest, but also upon the continuance of some status, such as the life of a person, whose duration can only be estimated by the theory of probabilities, on the average of a large number of cases. The former class is dealt with under the article INTEREST; the theory of annuities certain being, in fact, a branch of the theory of compound interest.

The LIFE ANNUITY (which is generally meant when the simple term 'annuity' is employed) is the principal example of the latter class, and to it our remarks must be mainly directed. In scientific treatises on the subject, an annuity is always assumed, unless otherwise described, to consist of an annual income of £1, or more simply of 1, payable at the end of each year survived—the amount for any larger sum being easily derived therefrom. When, in addition, a proportion of the year's annuity is payable up to the day of death, the annuity is said to be *complete*—the ordinary annuity being sometimes, for distinction, referred to as a *curtate* annuity. By the Appointment Acts, however, annuities are held as accruing from day to day, and therefore as apportionable or complete unless otherwise specified—the legal and the scientific practice being thus at variance in this respect. When the first payment is due in advance, the annuity is known as an *annuity due*; and on the other hand, when the first payment is not to be made until the expiry of a certain number of years, it is called a *deferred annuity*.

The honour of having been the first to place the calculation of life annuities on a scientific basis, by applying the doctrines of probabilities and of compound interest to a mortality table deduced from the recorded statistics of an actual community (Breslau), belongs to the celebrated astronomer royal, Halley. His monograph on the subject is printed in the *Philosophical Transactions* for January 1693. When Halley wrote, the Revolution government was endeavouring to complete the raising of a sum of a million sterling, by the issue of life annuities, offering 14 per cent. during the lifetime of any nominee, without restriction of age; thus appraising selected life-interests at only a trifle more than seven years' purchase. Notwithstanding the fact that Halley's table showed the life-interests of young nominees to be worth upwards of thirteen years' purchase, or nearly double the amount charged, money found its way but slowly into the national treasury. Adam Smith attributes this to the supposed instability of the government; but it may doubtless also be traced to ignorance or distrust of Halley's conclusions on the part of his countrymen. Certain it is, that at a much later period (1746), an issue of exchequer life annuities—again on ruinous terms, and without restriction of age—was left to be taken up mainly

by Dutchmen, who, being well informed on the subject of life contingencies through the writing of Kerseboom, nominated children, and mostly young females; while the English subscribers selected their nominees from either sex, and of any age, up to 50 or 60 indifferently.

In 1808 the National Debt Commissioners commenced the granting of life annuities, graduated according to age, on the basis of the Northampton table of mortality (see MORTALITY, TABLES OF). Previous annuity transactions had resulted in heavy loss, and it might have occurred to those responsible for the new departure, that that loss was not likely to be retrieved by adopting a table which had been proved to yield a large profit when used as a basis for life-assurance premiums! Not until 1828, however, and after Mr Finlaison, the government actuary, had pointed out that the loss from the annuity business was advancing at the rate of £8000 per week, was the Northampton table abandoned. Shortly thereafter, new tables of annuities, deduced from the past experience of the government, and distinguishing between male and female lives, were issued. Since then, the rate of mortality prevailing among government annuitants has been twice re-investigated, so as to embrace the additional data accumulated. The existing rates for government annuities are deduced from tables issued in 1884. These tables embrace the further feature of giving effect to the superior vitality found to prevail among the lives at the date of the purchase of the annuities, as compared with that of the general body of annuitants of corresponding ages. The same tables are doubtless the most appropriate basis upon which life-assurance companies, and other institutions granting annuities, can construct their scale of charges. But while the government rates are based upon the assumption that only $2\frac{1}{2}$ per cent. interest will be realised on the investments, assurance companies can afford to assume a future rate of $3\frac{1}{4}$ or $3\frac{1}{2}$ per cent., while trusting, like the government, to the additional interest realised beyond the rate assumed proving sufficient to provide for the expenses of conducting the business. The following table gives examples of the rates of annuity, per £100 sunk, deduced from the new government annuity tables—the annuities being calculated as 'complete,' and payable by half-yearly instalments:

AGE.	MALE LIFE.		FEMALE LIFE.	
	$2\frac{1}{2}$ p. cent.	$3\frac{1}{4}$ p. cent.	$2\frac{1}{2}$ p. cent.	$3\frac{1}{4}$ p. cent.
40	£ s. d. 5 11 10	£ s. d. 6 7 2	£ s. d. 5 0 6	£ s. d. 5 15 5
45	6 1 3	6 16 5	5 9 1	6 3 9
50	6 13 4	7 8 4	6 0 7	6 15 1
55	7 10 0	8 4 9	6 15 8	7 10 1
60	8 14 2	9 9 0	7 16 10	8 11 2
65	10 6 11	11 1 10	9 6 5	10 0 10
70	12 10 11	13 6 0	11 9 8	12 4 6
75	15 11 8	16 7 2	14 6 1	15 1 1

The rates in the column headed $2\frac{1}{2}$ per cent. are those actually allowed by the government; while those in the column headed $3\frac{1}{4}$ per cent. may be taken as affording an approximation to the more favourable terms which may be obtained from various life-assurance offices in this country. A comparison of the two will show that at least past errors are not being perpetuated by the government.

The total sum paid by the government, in respect of annuities, during the year ending 31st March 1886, was £1,038,210, while the corresponding sum paid by the assurance offices during the year 1886, was about £625,000. These two sums, however,

represent only a very small proportion of the total annuity interest of the country; for, not to speak of the various widows' funds and annuity societies, it has to be borne in mind that a very large amount both of real and of personal property in this country is held in *liferent*.

There is another important practical aspect in which the subject of life annuities may be viewed. While the government and corporate bodies granting annuities rely upon the principle of averages for the satisfactory working out of their transactions, a purchaser of an isolated annuity must proceed differently. He requires to protect himself against the loss of his capital, through the early death of the annuitant, and this can only be done by effecting an assurance on the life of the latter, without which, the transaction becomes a speculation and not an investment. Suppose a complete life annuity of £50 to be offered for sale, and an individual to be willing to purchase it at such a price as will yield him 5 per cent. on his outlay; then the first thing he would require to ascertain would be the rate of premium at which the life of the annuitant could be assured. This being found to be, say, 3 per cent. per annum, the intending purchaser would next proceed to calculate the sum, *X*, the interest upon which, together with the premium to assure its return at the death of the annuitant, would amount to £50. Thus:

$$(5 + 3) \times X \div 100 = 50 \therefore X = 625.$$

The premium to assure £625 is £18, 15s., and the interest on £625 at 5 per cent. is £31, 5s., together making up the annuity of £50. It should be borne in mind, however, that the £625 being the total outlay, the sum that can be paid to the seller is only £606, 5s., being the former sum, less £18, 15s., the amount of the first premium which requires to be paid in advance to the assurance office.

Of other forms of contingent annuities, a single example may be given. With many widows' funds it is a rule that the widow ceases to draw her annuity if she marries again. The calculation of an annuity ceasing either at death or upon re-marriage leads to no theoretical difficulties; but in order to obtain satisfactory results, it is necessary to have carefully compiled statistics of the ratio of re-marriage among widows of various ages.

In the law of England, an annuity is the right to the yearly payment of a certain sum of money, which is charged upon the person or personal estate of the individual bound to pay it. If it is charged upon real estate, the burden is called a rent or rent-charge, and not an annuity. An annuity may be created for a term of years, or for the life or lives of any persons named, or in perpetuity; and in the last case, if granted to a person and his heirs, the annuity is reckoned among incorporeal hereditaments; because, although the security is personal only, the annuity will descend in the same manner as real estate. In 1854 the old statutes relating to annuities were repealed, and enrolment in Chancery of annuity deeds is no longer necessary to give them validity. But registration is necessary in the case of annuities charged on land.

In Scots law, an annuity, as such, may be charged on real estate as well as on personality. In that system it has been simply defined to be a right to a yearly payment in money; and it may be created either by the payment of the sum of money in the form of a purchase, or it may be secured over land. In the latter case the creditor, in default of his annuity, may attach the land charged, claiming a capital sum out of the land sufficient to produce an annual interest equal to the annuity, until the expiration of the same. A like rule holds for the claim upon an annuity in bankruptcy. The instrument by which,

in Scotland, the annuity is constituted in either of the above forms is called a Bond of Annuity. The right to an annuity on the life of another descends to the heir of the creditor. The annuitant under a trust is entitled to have the trust kept up for security.

Annuity-tax, a local impost for the payment of the salaries of the Established clergy of the city of Edinburgh. It was first established on a limited scale by an act of the year 1661; and was extended in its sphere of operation by an act of the legislature as lately as 1809. It amounted at one time to 6 per cent. on the rents of houses and shops within the royalty. It was a peculiarity of this tax that the members of 'the College of Justice,' including the lawyer class generally, enjoyed an exemption from it, as a relic of an ancient privilege by which they were induced to reside and hold the courts of law in Edinburgh. The tax was reduced in 1860; and, under an act passed in 1870, it was redeemed by payment of £56,500 by the Corporation to the Edinburgh Ecclesiastical Commissioners.

Annulet (Lat. *annulus*, 'a ring'), a term in Architecture for a small fillet or band which frequently surrounds a column, &c. The annulet, a ring, is a charge in Heraldry. See CADENCY.

Annuloida, Annulosa. See WORMS.

Annunciation, the tidings brought by the angel Gabriel to the Virgin Mary of the incarnation of Christ. Also the festival kept by the church, in commemoration of this event, on the 25th of March. The festival was instituted about the beginning of the 7th century, those sermons of Athanasius and Gregory Thaumaturgus in which it is mentioned being now rejected as spurious; and the earliest certain references to it occurring in the acts of the Tenth Council of Toledo (656), and of the Trullan Council (692). In England, the festival is commonly called Lady Day (q.v.). Among the Jews, this title is given to a part of the ceremony of the Passover.

The *Order of the Annunciation*, now the highest Italian order, was instituted in 1360 by Amadeus VI., Duke of Savoy, and in 1725 was made the first order of the kingdom of Sardinia. The king is always grand-master. The knights who, since 1720, are not limited in number, must be of high rank, and already admitted to the orders of St Mauritius and St Lazarus.

Annus Deliberandi, in Scots law, was the period of a year allowed to an heir to deliberate whether he would accept the inheritance with the burden of his predecessor's debts. The year commenced on the death of the ancestor, unless in the case of a posthumous heir, when the year ran from the birth of the heir himself. By recent legislation, however, the period is shortened to six months, so that at the end of that time the creditors of the deceased may proceed to attach the estate, whatever the heir may resolve to do.

Anobium. See BORER and DEATH-WATCH.

Anode (Gr. *ana*, 'up,' and *hodos*, 'a way'), a term in electrolysis (see GALVANISM) introduced by Faraday to designate the positive pole, or that surface by which the galvanic current enters the body undergoing decomposition (electrolyte); as opposed to *cathode*, the negative pole.

Anodyne (Gr. *an*, 'not,' and *odynē*, 'pain'), a medicine used to assuage pain. Anodynes may act either on the nerves and nerve-terminations (aconite, belladonna, cocaine, &c.); on the brain (chloral, Indian hemp); or on all these parts (opium, bromide of potassium). Those which act on the brain also tend to induce sleep.

Anointing. See CHRISM, CORONATION, EXTREME UNCTION.

Anomalistic Year is the interval that elapses between two successive passages of the earth through its perihelion, or point of nearest approach to the sun. If the earth's orbit had a fixed position in space, this period would correspond with that of a sidereal revolution, or the time the earth takes after leaving any point of the heavens to return to it again; but the disturbing influence of the other planets causes the perihelion to advance slowly (11"·8 annually) in the direction of the earth's motion; so that the anomalistic year is longer (4 minutes 39 seconds) than the sidereal. The length of the anomalistic year is therefore 365 days, 6 hours, 13 minutes, 49 seconds.

Anom'aly (Gr. *anomalía*, 'irregularity'), the angle measured at the sun between a planet in any point of its orbit and the last perihelion. It is so called because the first irregularities of planetary motion were discovered in the discrepancy between the actual and computed distance. The anomaly was formerly measured from the aphelion, the opposite point of the ellipse; but from the fact that the aphelia of most of the comets lie beyond the range of observation, the perihelion is now taken as the point of departure for all planetary bodies.

Anona. See CUSTARD-APPLE.

Anonaceæ, the custard-apple order, are Thalamifloral Dicotyledons, closely allied to Magnoliaceæ. They are trees and shrubs, mostly tropical, and usually aromatic and fragrant. The fruit is sometimes dry, and in this case is usually aromatic and pungent—e.g. Calabash Nutmeg (*Monodora myristica*), and Ethiopian Pepper (*Xylopiya aromatica*). More frequently, however, the fruit is succulent, and is then often fragrant and delicious. See CUSTARD-APPLE.

Anonym'ous (Gr., 'nameless'), a term applied to a book the author of which does not give his name; when an assumed name is given, the term PSEUDONYMOUS is used. Works of this class constitute one of the great difficulties of bibliography.

In Great Britain, till the foundation of the *Fortnightly* and *Contemporary* Reviews (1865-66), political articles were generally anonymous, as also was most of the literary criticism, till the starting of the *Academy* (1869). It is generally admitted that anonymity secures the independence of the critic, and enables him to write with greater freedom, vigour, and power; but it is true that he often abuses his advantage, and gratifies under the veil of the anonymous his own personal pique. The article on 'the fleshly school of poetry' in the *Contemporary Review* for October 1871, which drew upon its author such merited castigation from Dante G. Rossetti in his famous letter to the *Athenæum* on 'the stealthy school of criticism' (December 16, 1871), was an example of an attempt to preserve anonymity even in a magazine where the articles were signed—its author, Robert Buchanan, having used the pseudonym of 'Robert Maitland.' Perhaps the most intolerable abuse of anonymity is the anonymous letter, which, even when the writer is known, is legally punishable only in so far as it is slanderous or comes under the law of Libel (q.v.). See Barbier's *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (Paris, 1806, 3d ed. 1872-79), which embraces the titles of about 24,000 works, with the names of those who are assumed or known to be the authors. Other lists of anonymous and pseudonymous literature will be found in the indexes to *Notes and Queries*; in 'Olphar Hamst's' *Handbook of Fictitious Names* (1868); Cushing's *Initials and Pseudonyms* (New York, 1885), with his companion volume, *Anonyms* (1887), comprising the titles of 20,000 books and pamphlets, and authors' names; and Halkett and

Laing's *Dictionary of Anonymous and Pseudonymous Literature* (4 vols. Edin. 1881-1887).

Anoplotherium (from the Greek *an*, 'not;' *hoplon*, 'armour;' and *thērion*, 'a beast'), a genus of extinct even-toed hoofed animals, Artiodactyla (q.v.), established by Cuvier from bones occurring in great abundance in the gypseous strata of the Oligocene formation near Paris. They are found also in the same formation in the Isle of Wight and elsewhere. The teeth differ from those of all other Ungulates, extinct or recent. There are six incisors, two canines, eight premolars, and six molars in each jaw—the dental formula thus agreeing with that of the fossil genus *Palæotherium* (q.v.); but the teeth are arranged in a continuous series without intervening vacancies—a circumstance very remarkable, as it does not occur in any existing quadruped, but now appears in man alone. The molars of the upper jaw have quadrate crowns; those of the lower are marked with a double or triple crescent of enamel, which forms prominent ridges. In some respects, the teeth resemble those of the rhinoceros, and exhibit generalised selenodont characters—that is to say, the teeth are crescentic, like those of the Ruminantia (q.v.), or ruminating quadrupeds, between which and the non-ruminant Artiodactyla the *Anoplotherium* has been thought to form a connecting

Anoplotherium.

link; but in some of the species originally included in this genus, and which are now sometimes ranked along with it under the name *Anoplotheroids*, the teeth exhibit peculiarities which have led to the supposition that their food may not have been exclusively vegetable. The snout is not much elongated, and it is evident that there was no proboscis. The feet are terminated by two toes, as in the Ruminantia; but they have always separate metacarpal and metatarsal bones, not a single *canon* bone. Several species of *Anoplotherium* have been determined—the size of the animal being about that of the ass. Closely allied to *Anoplotherium* are certain other genera, of which *Dichodon* and *Dichobune* are the most important. These, with *Anoplotherium*, form the family of the *Anoplotheridae*.

Anquetil, LOUIS PIERRE, a French historian, born at Paris in 1723, took orders, and, after filling educational posts at Rheims and Senlis, got a government appointment under Napoleon. He died, a member of the Institute, at Paris, September 6, 1806. He wrote a history of Rheims, and numerous memoirs on periods of French history; but his great work is his *Histoire de France* (14 vols. 1805), continued by Bouillet to 1862 in 6 additional volumes.

Anquetil-Duperron, ABRAHAM HYACINTHE, brother of the preceding, a French orientalist, was born at Paris, December 7, 1731. He first studied theology, but finally devoted himself to oriental languages, and such was his passion for this study that he enlisted as a private soldier for India at twenty-three in order to gratify it. The government having been made aware of this proof of the scholar's ardour, made him an allowance so as

to enable him to proceed independently. After an extensive journey in India, he fixed his residence at Surat, where he gained an intimacy with the Parsee priests, and obtained from them manuscripts of the Zend-avesta and the later Persian religious books. After the fall of Pondicherry (1761), he returned to Europe, carrying with him nearly two hundred manuscripts, and soon obtained through the influence of the Abbé Barthélemy a situation in the Bibliothèque Royale. His *Zend-avesta, ouvrage de Zoroaster*, appeared in 1771, and being the first translation ever made into a European tongue, attracted much attention. This translation has long been superseded, as it was made, not from the original, but from the more or less inaccurate Persian translation of his Indian teacher. Another important work is his *Oupnek'hat* (1801-2), a Latin translation of two manuscripts which contained an old Persian version of the chief Indian *Upanishads*. It was from this translation that Schopenhauer drew that intimate acquaintance with Indian philosophy which influenced his own system so profoundly. Anquetil-Duperron died at Paris 17th January 1805.

Ansars, more correctly *Nossairians*, an Arab sect living in the mountainous region of Syria north of the Lebanon Mountains. Their whole number is about 75,000. Their religious forms show their origin in Mohammedan gnosticism, with an admixture of the elements of old Syrian nature-worship. They appear first in the 10th century, but the history of their origin is obscure. They believe in a Mahdi or Messiah to come, the twelfth and last of the imams or emanations of the divine spirit, and they keep secret their religious rites and grades of initiation. Like the Shiites, they reverence Ali, the nephew of Mohammed; and they practise impure mysteries which have made them the by-word of the neighbouring races. Their prophet is Nossair, the first to proclaim the apotheosis of Ali, and from him they derive their name. They have special religious books, and a kind of holy communion with the cup; in their prayers they turn towards the rising and the setting sun; they believe also in a kind of Trinity; and in a constant transmigration of souls, which for the faithful is a process of purification until they reach at length the higher and more perfect states of earthly life, and find places as brilliant stars on the horizon. Those, however, who have derided or made known the sacred mysteries, or who have denied the divinity of Ali, are doomed to death, or are transmigrated into Jews, Christians, or Mohammedans, or into dogs, swine, and asses. The Ansars have often defended their freedom with bravery against the Turks. The name Ansars was also applied to the first adherents of Mohammed.

Ansbach (in England often ANSPACH), a town of Bavaria, on the Rezat, 25 miles SW. of Nürnberg. It has manufactures of furniture, buttons, bricks, woollen-yarn, lace, gold embroidery, beer, chicory, tobacco, and cigars; as well as straw-plaiting and iron-founding, and a brisk horse and cattle market. The situation is pleasant, but there are no remarkable buildings, except the deserted palace of the former margraves of Ansbach, surrounded by gardens, and the church of St Gumpert, said to occupy the site of a church erected in the 8th century. The margraves of the old principality of Ansbach were a branch of the family of Hohenzollern. The last of them gave up his possessions in 1791 to Prussia; and in 1807 Napoleon transferred Ansbach to Bavaria. Pop. (1885) 14,057.

Ansdell, RICHARD, animal and landscape painter, was born at Liverpool in 1815. Abandoning business for art, he exhibited at the Royal Academy in 1840, and at the British Institute in 1846. A visit to Spain with John Phillip in 1856

led to a series of Spanish subjects. He thrice won the Heywood Medal at Manchester, and a gold medal at the Paris Exhibition of 1855. He was elected A.R.A. in 1861, and R.A. in 1870. He died 20th April 1885.

Anselm OF CANTERBURY, a scholastic philosopher, was born at or near Aosta, in Piedmont, in 1033. At the age of fifteen, Anselm ardently desired to enter the monastic life, but his father sternly refused his consent. After his mother's death, he resolved to escape from his father's oppression, and to seek a career across the Alps. Here he spent three years in Burgundy, and being attracted by the reputation of Lanfranc, he went in 1060 to study at the monastery of Bec, in Normandy. Three years after, he succeeded his master as prior, and in 1078 became abbot of this monastery, the most famous school of the 11th century. Lanfranc, who in the meantime had gone to England, and become Archbishop of Canterbury, died in 1089; and the diocese remained four years without a successor, till in 1093 Anselm was appointed. He was distinguished both as a churchman and a philosopher. His numerous embroilments with William Rufus and his successor, and the unbending spirit which he displayed in these, even when subjected to banishment, indicate the vigour and resoluteness of his character, as much as his writings exhibit the depth and acuteness of his intellect. Exiled by Rufus, Anselm returned at Henry's urgent request; but the new monarch's demand that he should renew his homage, and be again invested with his archbishopric, was met with an absolute refusal, and led to a second exile of two years' duration. In 1105, however, Anselm's threat of excommunication led to the reconciliation of king and prelate, and the compromise was devised which, in 1122, was accepted by pope and emperor at Worms (see *INVESTITURE*). Anselm was a second Augustine, superior to all his contemporaries in sagacity and dialectical skill, and equal to the most eminent in virtue and piety. Embracing, without question, the doctrines of the church, mostly as stated by Augustine, and holding that belief must precede knowledge, and must be implicit and undoubting, he yet felt the necessity of a religious philosophy, urged the duty of proceeding from belief to knowledge, and sought to reduce the truths of religion into the form of a connected series of reasonings. It was for this purpose he wrote his *Monologion*. In his *Proslogion*, he strove to demonstrate the existence of God from the conception of a perfect being, as Descartes also subsequently did. His *Cur Deus Homo* (Eng. trans. by Prout, 1887) argues the necessity of the Incarnation, all subsequent speculation on which it has profoundly influenced (see *ATONEMENT*). Besides his philosophical treatises, his *Meditations* and *Letters* have come down to us, revealing his humble fervent faith, and the tender sympathy of his nature. Anselm may in a sense be reckoned the earliest of the schoolmen, to whom, although they employed a different method, his works first supplied the impulse to justify Scripture and the church by reason. He died April 21, 1109, and was buried next to Lanfranc at Canterbury. In 1494 he was canonised, but Dante had long before placed him among the greatest saints in paradise. In 1720 Clement XI. expressly placed him in the list of church authorities. See Rémusat's *Anselme* (1853; 2d ed. 1868); Dean Church's *Anselm* (1870); *Life and Times of St Anselm* (2 vols. 1883), by Mr Martin Rule, who has also edited for the Rolls Series Eadmer's two lives of Anselm (1884).

Anser. See ANAS, and GOOSE.

Ansgar (*Anscharius*), the Apostle of the North, was born in Picardy in 801. Under the patronage

of Louis le Débonnaire, he went, with his colleague Authbert, to preach Christianity to the heathen Northmen of Sleswick. He suffered many persecutions; but had nevertheless such success that, in 831, the pope established an archbishopric in Hamburg (transferred to Bremen in 847), and Ansgar was appointed the first archbishop. He made several missionary tours in Denmark and Sweden, and died in 865 at Bremen. See his *Life* by Tappehorn (Münst. 1863).

Anson, GEORGE, LORD ANSON, born 23d April 1697, at Shugborough Park, Staffordshire, entered the navy in 1712, and was made a captain in 1724. In 1739, on the outbreak of war with Spain, he received the command of a Pacific squadron of six vessels, with instructions to inflict whatever injury he could on the Spanish commerce and colonies, and he sailed from England in September 1740. Vessels, crews, and stores were alike indifferent; yet, in spite of all disadvantages, he achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. With only one ship, and less than two hundred of his original followers, but with £500,000 of Spanish treasure, he returned to Spithead, June 15, 1744, having circumnavigated the globe in three years and nine months. His perilous cruise greatly extended the knowledge of navigation and geography. As a reward for his services, Anson was made Rear-admiral of the Blue (1744); and in 1747, having utterly defeated the French admiral Jonquière, off Cape Finisterre, and captured £300,000, he was made Baron Anson of Soberton, and, four years later, First Lord of the Admiralty. In 1761 he received the high dignity of Admiral of the Fleet. He died at his country seat, Moor Park, Hertfordshire, 6th June 1762. Few works have been so popular as Anson's *Voyage round the World* (1748), of which, whether edited by Walter or Robins, he himself was virtually the author. See his *Life* by Sir John Barrow (1839).

Ansonia, a borough within the town of Derby, New Haven county, Connecticut, lies on both sides of the Naugatuck River, 2 miles above its confluence with the Housatonic, and 12 miles W. of New Haven by rail. It has manufactures of iron, brass, and copper goods, clocks, electrical goods, webbing and knit goods, carriages, and hardware. Pop. 8500.

Anspach. See ANSBACH.

Ansted, DAVID THOMAS, geologist, born in London, February 5, 1814. After gaining a fellowship at Jesus College, Cambridge, he devoted himself to geology under Sedgwick, in 1840 was appointed to the chair of Geology in King's College, London, and was elected F.R.S. In 1845 he became attached to the Indian military school at Addiscombe, and the college for civil engineers at Putney. From this time until his death, through a carriage accident near Woodbridge, in Suffolk, May 13, 1880, he devoted his studies to the economic applications of geology, and was much consulted in great mining and engineering operations. His works on his chosen subject were numerous and popular.

Anstey, CHRISTOPHER, born in 1724, was educated at Bury St Edmunds, Eton, and King's College, Cambridge, of which he was a fellow from 1745 to 1754. In 1766 he published the *New Bath Guide*, whose fun and humour—somewhat faded now—achieved a success approached by none of his subsequent poems. He died in 1805.

Anstruther, EASTER and WESTER, two contiguous royal burghs on the coast of Fife, 9 miles south of St Andrews. Fishing and fish-curing are the staple industries, the harbour (1866-77) being at Cellardyke. East Anstruther was the birth-

place of Dr Chalmers, Tennant the poet, and Goodsir the anatomist. With the other St Andrews burghs, they return a member to parliament. Joint pop. 1843.

Ant. Ants (*Formicidæ*, *Myrmicidæ*) are a group of Hymenopterous insects, in the same order as wasps and bees, which they resemble, not only in general structure, but in the high evolution of their instinctive habits and social life. The word 'ant' is contracted from the old-fashioned Saxon word *emmet*; and 'pismire' is another almost obsolete, originally Danish term. The white ants or Termites (q.v.) are members of an entirely different order—Neuroptera. The ant family is represented by between two and three thousand different forms, widely distributed in temperate and tropical countries. Three sub-families are usually distinguished—the *Formicidæ* proper, the *Poneridæ*, and the *Myrmicidæ*. Numerous fossil forms are known, often beautifully preserved within pieces of amber. In the tertiary formations, eighty-three distinct species have been chronicled.

The study of ants has engaged the attention of naturalists from before the days of Aristotle and Pliny, but it is only since the beginning of this century that the careful researches of Latreille, Hüber, Forel, Smith, Mayr, Lubbock, and many others, have established an exact knowledge alike of their forms and habits.

Different Forms.—Like most bees, ants occur in three different forms—(a) the perfect females or queens, the mothers of new generations; (b) the short-lived males, which die soon after the 'nuptial flight'; and (c) the great majority of workers, which are predominantly females, though rarely sexual, and often exhibit different forms according to the work which they have to do. In some cases, further, there are distinct classes of workers.

Structure.—As in other insects, the body consists of three parts—head, thorax, and abdomen. The head, which of course contains the 'brain,' is, though minute, yet large in proportion.

Life-history.—As in many other insects, there are four chapters in the life-history of an ant—viz. egg, larva, chrysalis, and perfect insect. The

after a period varying from a few weeks to as many months, become pupæ or chrysalids. These may remain naked, or may spin silken robes or cocoons. The nursing care of the workers does not cease; the brood is kept clean, shifted into the sunshine, or carried off in case of danger. Ant pupæ are collected and sold both in this country and on the Continent as food for young birds. After a short while, during which no food is taken, the perfect insects appear, weak and helpless, still dependent upon the kindly aid of the workers, even to free them from their silken birth-robes. For some weeks, in fact, the workers continue to care for them. As in all insects with a similar history, or complete metamorphosis, the insect has attained its full size when it leaves the pupa stage. Left to themselves, the males generally die after fertilising the queens in the nuptial flight, but the queens and workers may live for several years. Great numbers fall victims to other animals—insects, spiders, birds, ant-eating mammals, &c.; and, small as they are, ants are not unfrequently attacked by still smaller parasites.

Food.—The whole food-supply for the inmates of the nest is collected by the industrious workers, or in a few cases by captured slaves of another species. The food chiefly consists either of insects and available animal matter, or of sweet vegetable substances, such as honey, fruit, and sugar. In the Honey Ant, described by M'Cook (see fig. 4), the abdomen is enormously distended with honey, which is forcibly injected by the normal workers, and is afterwards utilised for the young brood. When the honey exudes by accident, it is greedily lapped up by the workers, but if the honey-pot die, both corpse and honey are buried. The squeezed-out honey is said to be sold in Mexican markets as the basis of a drink resembling mead. The harvesting or grain-storing habit, often alluded to in ancient literature, and remaining unquestioned in popular belief, was for a long time regarded with considerable scepticism by scientific investigators. It was questioned in 1747 by the Rev. W. Gould, one of the early students of ants in Britain, and such authorities as Latreille and Hüber believed his hesitation to be thoroughly justified. The barleycorn-like pupæ cocoons suggested the possibility of mistaken observation, while the torpor of ants during the winter of northern countries did not consist with any storing habit. Yet the opinion of the ancients was expressed in unmistakably circumstantial language, as in this regulation as to ant-granaries found in the Mishna: 'The little caves of ants, when in the midst of a standing crop, are adjudged to the owner of the field; of those behind the reapers, the upper part is the property of the poor, the lower of the proprietor.' The opinion of the ancients has been amply confirmed. Thus in 1829 Lieutenant-colonel Sykes noted at Poonah the large heaps of millet-seed stored up by a species of ant which he named *Atta providens*. The same was demonstrated by Mr Moggridge in regard to some ants in the south of Europe, while Dr M'Cook has given a most graphic account of the harvesting habits exhibited by the agricultural ants of Texas. Moggridge also noted that the seeds are somehow prevented from germinating, but if the process should in exceptional cases begin, the ants are clever enough to eat off the radicle.

Ants are especially fond of the sweet secretion which flows out from the plant-lice or Aphides (q.v.); and some species not only tap and tickle the latter to induce them to part with their honey-dew, but keep them, as Linnaeus said, as 'cows,' protecting them in sheds, and yet more marvellously caring for their eggs. Several breeds

Fig. 1.—A Common Ant (*Lasius flavus*):
a, queen; b, worker; c, male; d, larva; e, pupa.
(After Lubbock.)

minute white or yellowish eggs laid by the queen in the ant nest, are hatched in from two to six weeks, and develop into white legless larvæ or grubs. Both eggs and grubs are carefully watched, and the grubs fed, by the ever-vigilant workers. Thanks to the abundant food-supply, which is given them in a prepared form, the larvæ increase greatly both in size and in complexity, and

of aphid 'cows' are thus appropriated and utilised, and apparently regarded by these pastoral ants as distinctly their 'property,' for the possession of which, if need be, they will even fight. Other insects are sometimes similarly utilised. Several naturalists, such as Bates and Belt, have given vivid accounts of the ravages of the Drivers and Hunting Ants. 'The dread of them is upon every living thing. Their entrance into a house is soon known by the simultaneous and universal movement of rats, mice, lizards, cockroaches, and vermin of all sorts. When they are fairly in, we give up the house, and try to await with patience their pleasure, thankful indeed if permitted to remain within the narrow limits of our beds and chairs.' 'Wherever the marauding Ecitons move,' Bates says, 'the whole animal world is set in commotion, and every creature tries to get out of the way. The main column of the army, from four to six deep, moves forward in a given direction, clearing the ground of all animal matter dead or alive, and throwing off, here and there, a thinner column to forage on the flanks.' The blind driver ants of Africa (*Anomma*) are perfect nomads, overcoming every obstacle in their blind march, and even forming 'animated suspension-bridges' over broad streams. Though useful as scavengers, their unchecked multiplication may result in ravages very much the reverse of beneficial. More than a hundred years ago, vast hordes of *Formica saccharivora* appeared in the island of Grenada, and did the greatest damage to the sugar plantations. 'They descended from the hills like torrents, and the plantations, as well as every path and road for miles, were filled with them. Rats, mice, and reptiles of every kind became an easy prey to them; and even birds, which they attacked whenever they lighted on the ground in search of food, were so harassed, as to be at length unable to resist them. Streams of water opposed only a temporary obstacle to their progress; the foremost rushing blindly on certain death, and fresh armies instantly following, till a bank was formed of the carcasses of those which were drowned, sufficient to dam up the waters, and allow the main body to pass over in safety. Even fire was tried without effect. When it was lighted to arrest their route, they rushed into the blaze in such myriads as to extinguish it.' A reward of £20,000 was offered in vain for an effectual means of destroying them; but in 1780 a hurricane which tore up the canes, and exposed their habitations to a deluge of rain, freed the island from this plague. In reference to their food-acquiring habits, ants may be classified as hunting, pastoral, and agricultural—'three types,' as Lubbock remarks, 'offering a curious analogy to the three great phases in the history of human development.'

Nests.—Most ants live in chambered nests. These are of very varied construction, from simple heaps of loose material to houses of more or less elaborate architecture. Some simply utilise the shelter of a large stone, under which they burrow, while others weave a hanging silken nest; some bore into old stumps, which they riddle with their tunnels, and others form a home from leaves glued or woven together. The common yellow ant, *F. flava*, makes an underground nest, which looks like a little grassy mound, perforated by innumerable passages, and sometimes a foot in height. The nest of *F. rufa* is often twice as large, and exhibits a thatched dome, with lattice-work shutters and doors which are closed at night. In South America, the ant-hills are sometimes several feet in height, and exhibit internally a marvellously complex and orderly arrangement of chambers and galleries. The so-called 'mason-ants' use soft

clay in forming the roofs and partition of their neat chambers, while the 'carpenters' hollow out their houses in trees and shrubs. *F. flava* forms its partition-walls of a sort of papier-mâché of

Fig. 2.—Part of a Gallery, with Ant working on tiptoe: *Pogonomyrmex molificiens*, the Agricultural Ant of Texas. (From M'Cook.)

sawdust, earth, and spider's web. *F. smaragdina*, an East Indian species, forms its nest of a thin silk-like tissue. *F. bispinosa*, in Cayenne, makes a felt of the down which envelops the seeds of the *Bombax criba*; while an East Indian species, *Myrmica kirbi*, forms a globular nest of a congeries of tile-like plates of cow-dung. *M. nidificans*, in Malabar and Malacca, forms a nest of some papery material which it fixes on a leaf; and the 'umbrella' ant of Brazil was said by Bates to thatch its large mansion (sometimes 40 yards in circumference and two feet in height) with circles of leaf 'cut with accurate precision from coffee and orange trees, which they oftentimes strip bare to carry out their bold architectural designs.' Belt has, however, noted that, in Nicaragua at least, the leaves are stored until they decay and become covered with a fungus which forms the food of the ant. Roads, tunnels, and covered ways are

Fig. 3.—Ant's Nest (a mound disc) with Roads: *Pogonomyrmex molificiens*, the Agricultural Ant of Texas. (From M'Cook.)

also frequently formed round about the nests for safe and convenient transit. Many communities, sometimes including alien lodgers, may live within the bounds of a large nest, and a single community may contain more than half a million members.

Sexes.—As has been already noted, an ant's nest contains three kinds of individuals—the crowd of workers, the short-lived males, and one or more queen-mothers. The workers are really imperfect females, and besides the queens, some species include a third form of female. Though the queens are the real mothers, Lubbock has proved that in most nests there are a few fertile workers, but their eggs, if they develop at all, seem always to produce males. It is generally supposed that the ants are able, like bees, to determine, by differences of food, &c., whether a given egg will develop into a worker or a queen. In the course of summer, when external conditions are favourable, the winged males and young queens leave the nest in a marriage-flight, during which fertilisation is effected. The columns of myriad insects, rising like smoke, and glittering in the sun, attracted attention long before they were understood.

'Each column looks like a kind of slender network, and has a tremulous undulating motion. The noise emitted by myriads and myriads of these creatures does not exceed the hum of a single wasp. The slightest zephyr disperses them.' During this flight many fall victims to the elements and living enemies. It is still doubtful how the new nests are generally founded, but Lubbock has shown that an isolated queen-ant is capable of giving origin to a new community, while it appears that in other cases an old-established nest may adopt a fresh queen, secured by the workers when she falls near the nest from her marriage-flight. Several queens may reign together in one nest, and they are always treated with a loyal devotion, associated, however, with a judicious measure of control. The Rev. W. Farren White quotes the following interesting passage from Gould, who has been already referred to as one of the early students of British ants. 'In whatever apartment a queen condescends to be present, she commands obedience and respect, and a universal gladness spreads itself through the whole cell, which is expressed by particular acts of joy and exultation. They have a peculiar way of skipping, leaping, and standing up on their hind-legs and prancing with the others. These frolics they make use of both to congratulate each other when they meet, and to show their regard for the queen.' As among bees, there are a few genera of solitary ants. In these Mutillidae, the males are winged, the females wingless, and there are no workers. Four forms have been found in Britain, one of which, *Mutilla europaea*, inhabits the nests of humble-bees, on which it appears to be parasitic.

Division of Labour, and Polymorphism.—There is a general division of labour involved in the existence of a caste of workers separate from the males and normal females. But apart from this the workers come to discharge among themselves very different functions. The young and the old, the small and the large, are set apart for different duties. Such division of labour tends, however, to produce difference of form (or polymorphism), just as variety of occupation tends to do among men. Thus it is not surprising to find in some species several types or castes of workers. In the Saïba or umbrella ant of South America, besides males and queens, there are (a) small ordinary workers, (b) large workers with very large hairy heads, and (c) large workers with large polished heads. Bates suggests that the last two kinds are of use in war as passive butts, 'as *pièces de résistance*, serving as foils against onslaughts made on the main body of workers.' In other cases, certain members of the community serve as 'animated honey-pots,' with the somewhat tantalising function

gravely recorded. The observations of the ancients have been verified by Hüber with his characteristic carefulness, and Thoreau gives a graphic account of some of the encounters he witnessed during his life at Walden. In some ant communities, members of other species are captured when young, and used as slaves. As these not only work and forage for their masters, but even feed them, the latter degenerate, and *Polyergus rufescens* is wholly dependent even for its life on its slaves. Lubbock notes how every transition is exhibited between bold marauders and enervated masters—hopeless parasites upon their slaves. Besides the association with aphides already noted, ants tolerate various insect inmates within their nests.

Relation to Plants.—While flying insects, like bees, which carry the fertilising pollen from one plant to another, have played an important part in the evolution of flowers, ants have had an influence of another kind. Visits of ants would in most cases simply mean a loss of honey without any advantage to the plant; it is therefore natural that many plants should exhibit contrivances for warding off the attacks of ants. Moats formed by leaf-cups, curved slippery surfaces, narrow or closed passages, viscid secretions, bristling hairs, &c. are all effective protections against ants. In the tropics, some species of ants do much damage by stripping off the leaves of plants, but in other cases ants may be of actual service in driving off more destructive species or other insects. The large 'bull's-horn thorns' of certain Central American species of acacia are tenanted by a species of ants (*Pseudomyrma bicolor*), forming 'a most efficient standing army for the plant, which not only prevents the mammalia from browsing on the leaves, but delivers it from the attacks of a more dangerous enemy—the leaf-cutting ants.' Moseley notes that in the case of two plants growing as Epiphytes (q.v.) on trees, a gall-like tumour is always formed at their base by ants, without which the plants cannot thrive.

Intelligence.—The senses of ants are well developed. They are keenly sensitive to slight changes of temperature and light, and can both perceive rays and hear sounds for which our sense-organs are not adapted. Some forms are able to make a rasping noise by means of a structure on the abdomen, and the solitary ant, *Mutilla*, utters when seized a characteristic note between a buzz and a squeak. The highly developed sense of smell appears to aid them greatly in finding their way, in which, however, they are not, at the best, adepts. They are able to recognise the members of their own community even when these are intoxicated, or removed from the nest as larvæ and brought up separately. Several naturalists have shown that ants are able definitely to communicate with one another 'by something approaching to language.' The habits of ants have long formed a favourite study of naturalists, and the intimacy with which they have been studied is, doubtless to some extent, the reason of their being so often referred to. Their ceaseless industry when there is work to do has become proverbial, while many authorities have also noted an indulgence in 'sportive exercises' or 'play.' A recent observer, the Rev. W. Farren White, describes the exuberance of delight exhibited by the inmates of a formicarium when placed near the fire. 'They embraced each other, and skipped and danced like playful lambs or kittens.' Careful removal of the dead has also been observed. Their ingenuity in economising labour, e.g. in dropping desired objects from a height to others waiting below—in overcoming obstacles, e.g. by themselves forming living bridges or building more substantial inanimate ones—in the architectural devices exhibited by their manifold

Fig. 4.—Honey Ant (*Myrmecocystus mexicanus*):
a, natural size.
(From Rev. W. Farren White.)

of 'receiving, retaining, and redistributing the honey.' Sanguinary wars between different species of ants have been observed from very early times, and the dates of certain remarkable campaigns

neats, and in many other ways—has become a common subject of deserved admiration, though their marvellous powers are associated with no less striking limitations. In their recognition after separation for months, in their care for the young or disabled, as well as in their persistent enmity to competing species and communities, ants exhibit a considerable range of emotional development.

'When we see an ant-hill, tenanted by thousands of industrious inhabitants, excavating chambers, forming tunnels, making roads, guarding their home, gathering food, feeding the young, tending their domestic animals, each one fulfilling its duties industriously and without confusion, it is difficult altogether to deny them the gift of reason, or escape the conviction 'that their mental powers differ from those of men, not so much in kind as in degree' (Lubbock).

See *INSTINCT, INSECT, APHIDES*; Lubbock's *Ants, Bees, and Wasps* (Internat. Sc. Series, 1882), to which valuable work, as well as to personal revision by its author, this article is very largely indebted; Rev. W. Farren White's *Ants and Their Ways*, with a useful list of British ants; M'Cook's *Agricultural Ant of Texas* (1880); Bates's *Naturalist on the Amazon*; Belt's *Naturalist in Nicaragua*; and the abundant literature referred to in the works of the first two.

Antacids are drugs used for the purpose of neutralising or diminishing excessive acidity of the digestive system, or of the different excretions. Substances which act upon the former are termed direct, and upon the latter, remote antacids. Many drugs act in both ways, such as potash, soda, lithia, lime, and magnesia, as well as their combinations with carbonic acid. Some substances—as for instance, ammonia and its carbonate—are only direct antacids, being converted into acids in the body, and thus increasing the acidity of the urine. Others—like the acetates, tartrates, and citrates of the alkalies—are not direct antacids, inasmuch as they are neutral salts, but, being converted into carbonates in their passage through the body, they act as remote antacids, and reduce the acidity of the urine. The direct antacids are required when digestion is followed by the generation of too much acid. When this is confined to the stomach, potash is to be preferred, as being more readily absorbed, or in the case of aged or feeble individuals, ammonia, as being at once a stimulant and an antacid. If the acidity exists in the bowels, soda, lime, or magnesia is to be given, as being less readily absorbed than potash, and more likely therefore to reach the situation of the acidity. The remote antacids are required in all cases where the blood contains uric acid, and the urine is excessively acid. In such cases, potash or lithia must be chosen, as forming much more soluble urates than soda.

Antæus, in Greek Mythology, a son of Poseidon and Gē, a huge giant in Libya, who challenged all strangers who came to his country to wrestle with him. No one could throw him, because every time he touched the earth, his mother, he received new strength. Those whom he threw were slain, and out of their skulls he built a temple to his father, Poseidon. At last, Hercules crushed him, lifting him up so that he could not touch the earth. The overthrow of Antæus was a favourite subject, both in ancient poetry and art.

Antal'cidas, a Spartan politician, chiefly known by the celebrated treaty concluded with Persia at the close of the Corinthian war in 387 B.C., and called by his name, as it was the fruit of his skilful diplomacy. By this treaty, all the towns on the mainland of Asia passed under the Persian sway; the Athenians retained only Lemnos, Imbros, and Scyros, while all the other Greek cities were declared independent. In con-

sequence of it, Spartan influence became supreme in Greece, while everything gained by Athens in the Persian wars was lost.

Antanànarivo, or TANÀNARIVO, the capital city of Madagascar, and seat of the government, has a population estimated at 80,000. It is situated on a hill, in an undulating district, at an elevation of 5000 feet above the level of the sea. It is exposed to fearful thunder-storms. The approach to it from Tamatave, the chief seaport, is extremely tedious and difficult, owing to the want of roads. It is, in spite of this, the seat of considerable trade and industry. The royal palace occupies the summit of the hill; adjoining are the dwellings of the chief officers of government; and below these, covering the slope of the hill, and built on terraces, are the houses of the other inhabitants, constructed of mud and sun-dried bricks. The people exhibit a considerable aptitude for civilised usages; and, thanks to missionary enterprise, considerable progress has been made towards the adoption of European habits.

Antà'ra, or ANTAR, a celebrated Arab chief in the middle of the 6th century, one of the seven poets whose prize-poems were hung up on the Caaba, and thence called *Moallakât* ('suspended'). In the poem of his that has descended to our day, he describes his warlike deeds and his love for Abia. His courage and heroism appear to have formed the groundwork of the voluminous romance known by his name, dating from the 8th century.

Antarctic Ocean. The Antarctic Ocean is situated about, or within, the Antarctic Circle. The Great Southern Ocean, according to modern geographers, is that part of the ocean which surrounds the world in one continuous band between the latitude of 40° S. and the Antarctic Circle. This band is only partially interrupted by the southern prolongation of South America. The northern portions of this band are often called the South Atlantic, South Indian, and South Pacific, while the southern portions are usually called the Antarctic Ocean. The average depth of the continuous ocean which surrounds south polar land is about two miles; it gradually shoals towards Antarctic land, which in some places is met with a short distance within the Antarctic Circle. The *Challenger* found 1800 fathoms near the Antarctic Circle south of Kerguelen, but Ross records a much greater depth in the same latitude south of the Sandwich group. Only three navigators, Cook, Weddell, and Ross, have crossed the 70th parallel south. Of several other expeditions that have crossed the Antarctic Circle, the most notable was the *Challenger* in 1874, the only steam-vessel that had visited these seas. The majority of Antarctic voyagers have discovered land south of the 60th parallel, Cook in 71° S. and 107° W. Bellingshausen discovered Peter Island and Alexander Land, D'Urville discovered Adelie Land. Wilkes found land extending from the 100th to the 160th meridian of E. long. between the parallels of 65° and 67° S. Ross discovered Victoria Land, and in February 1841 sailed along its coasts within sight of the high mountain ranges, 7000 to 10,000 feet above the sea, as far as 78° S. The mountain range here terminated in an active volcano, Mount Erebus, 12,000 feet in height. His farther progress was stopped by an icy barrier 150 to 200 feet in height, along which he sailed to the east for 300 miles. The depth off this ice-barrier was 260 fathoms, so that it was just in the condition to generate those large, flat-topped, tabular icebergs, which are the characteristic feature of the Antarctic regions. Where the coast is steep and high, there is no true 'ice-barrier,' the ice being only

6 or 10 feet above the sea, extending many miles from the shore. Ross and D'Urville alone have succeeded in setting foot on land within the Antarctic Circle. This land was of volcanic origin; but there is no doubt a large extent of continental land around the South Pole, for the *Challenger* dredged up granites, mica-schists, sandstones, and other continental rocks close to the ice-barrier. Mr Murray estimates the extent of the Antarctic continent at 3,000,000 square miles. Vegetation and land animals have not been observed on this land. Whales, grampuses, seals, penguins, petrels, albatrosses, and other oceanic birds abound. Diatoms are very abundant in the surface-waters, and their dead frustules form a pure white deposit called *diatom ooze*, about the latitude of 60°, outside the blue muds which surround the continent. Life is abundant in the surface-waters, and at the bottom of the ocean. The mean temperature both of the air and sea, south of 63° S., is even in summer below the freezing-point of sea-water. Between 60° and 63° S., a sensible rise takes place, temperatures as high as 38° F. being recorded both of sea and air in March. The *Challenger* found a cold layer of water sandwiched between a warm one on the surface and a warm one at the bottom; the surface layer was 37°·2; the cold layer at eighty fathoms was 32°·5; the temperature of the warm bottom layer was not accurately determined, but it was probably about 33° F. It is remarkable that the bottom temperature at 50° S. (33°·5 F.) is little different from the bottom water all over the Indian and other oceans. The return currents of dense, warm, tropical water from the Indian, Atlantic, and Pacific Oceans, which run southward along the eastern shores of America, Africa, and Australia, sink on reaching a latitude of from 45° to 56° S., and flow north at the bottom to supply the loss in the tropics by surface-currents and evaporation, and south, to supply the place of the ice-cold water drifted northwards. The barometric pressure within the Antarctic Regions appears to be low, considerably under 29·000 inches. The winds blow cyclonically in towards the Pole from the Southern Ocean, carrying with them much moisture. The fall of rain and snow is estimated as about equal to a rainfall of 30 inches annually. The ice on the Antarctic continent is stated by some writers to have a thickness of several miles, but there is no reliable information on this point. All our knowledge of the Antarctic is confined to the summer months of January, February, and the first weeks of March. No person has penetrated these regions at other seasons of the year. See POLAR EXPLORATION.

Ant-eaters (*Myrmecophagidae*), a family of South American mammals belonging to the insect-eating division of the order Edentata. The absence of teeth, the long head, tubular mouth, worm-like tongue, the marked development of the third digit of the fore-foot, and the insect diet, are prominent characteristics of this small family. (1) The largest form is the Great Ant-eater (*Myrmecophaga jubata*), or Ant-bear, as it is called in Demerara, which inhabits swampy regions in South and Central America. It measures 4 feet in length, not including the bushy tail, which is sometimes as long as the body. The long coarse hair is of a dark-gray colour, and a black band extends from the chest across the shoulder backwards. The skull is prolonged into a narrow snout. The ears and eyes are very small. The long worm-like tongue may be protruded to a length of 18 inches from the tubular mouth at the end of the muzzle, and is covered with a viscid secretion from large glands which extend back over the chest. By this means, the very abundant termites or white ants are caught in great

numbers as they issue from the invaded nest, and whipped with extraordinary rapidity into the mouth.

Great Ant-eater (*Myrmecophaga jubata*).

The internal opening of the nose is unusually far back in the mouth, as in crocodiles and whales. The posterior portion of the stomach forms a muscular gizzard in adaptation to the nature of the food. The third digit of the fore-foot is much larger than the three others, and bears a very powerful claw, which is used in breaking into the termite nests. In walking, the fore-toes are much bent, the pointed tips are protected by being turned inwards and upwards, and the animals thus rest their weight in a sort of club-footed fashion on the outer portions of the outer toes. The five toes of the hind-foot are almost equal, and bear strong claws; the broad sole rests on the ground. This form is wholly terrestrial, and has the reputation of being slothful, unsocial, and stupid. Like other insectivorous animals, it can live for prolonged periods without food. It spends much of its time in sleep, the long snout concealed in the fur of the breast, the hind and fore claws locked together, and the bushy tail thrown over all, as if for a shade from the sun. Though the collar-bones are rudimentary, the Great Ant-eater has great strength in its fore-legs, and is said to hug like the bear, so as to crush its enemy to death. The female bears but one at a birth, and carries it about on her back during its slow growth. The flesh is eaten by the Indians and negroes. Another much smaller form, the Tamandua (*T. tetradactyla*), is arboreal. The head is shorter, and the somewhat prehensile tail is scaly below and at the end. The Little Two-toed Ant-eater (*Cyclosurus didactyla*) is also arboreal. The skull is still shorter, the fur is softer, the feet adapted for climbing, the collar-bones well developed, and the tapering tail thoroughly prehensile.—(2) The Pangolins (q.v.), or Scaly Ant-eaters of the Old World, though closely related, belong to a different family, and are discussed elsewhere.—The name Ant-eater is given at the Cape of Good Hope to the *Orycteropus capensis*, the Aardvark (q.v.) or Earth-hog of the Dutch colonists, a quadruped of about the same size as the great ant-eater of America, and belonging to the same natural order.—(3) The *Echidna* of Australia are sometimes called Porcupine Ant-eaters; but though they agree with the above in the nature of their food, and in the sharp snout and protrusible tongue, their general structure is quite different. See ECHIDNA. (4) The *Myrmecobius fasciatus*, a small marsupial of Australia, is also called ant-eater.

Antecedent, a term in Logic, Grammar, and Mathematics. In Logic, it is a statement or proposition from which another is logically deduced. In Grammar, it is the substantive (word or clause) to which a relative points back. In Mathematics, we speak of the antecedent of a ratio—i.e. the first of two terms which compose the ratio; the first and third in a series of four proportionals.

Antediluvian (Lat. *ante*, 'before,' *diluvium*, 'the deluge') is the word used of anything that existed before the flood, in the patriarchal ages between Adam and Noah. The word is often employed in modern usage for anything antiquated or primitive, in a somewhat disparaging sense.

Antelopes (*Antilopidae*), a family of Mammalia belonging to the order of Ruminants (q.v.), and to the hollow-horned section of that order—in which the horns consist of a horny sheath, surrounding a bony process of the skull, and are permanent, not annually renewed. In antelopes, however, the bony centre of the horns is solid and not occupied, as in those of goats, sheep, and oxen, to a considerable extent, with cells communicating with the frontal sinuses. They differ externally from goats in their beardless chin, and from them and sheep in the absence of longitudinal angles or ridges on the horns, which are, however, very generally marked with cross rings. The body is slender and deer-like, the feet small and elegant, the tail short and tufted, the hair generally short, and the colour often lively. Some species, however, have comparatively long hair; and a few which inhabit cold mountainous regions are clothed with wool mixed with longer and coarser hair, as in the Chamois (q.v.) of the Alps, Caucasus, &c.; the Rocky Mountain Goat (q.v.) of North America; and the Chiru of the Himalayas. Many species have *tear-pits* below the eyes, as in Deer (q.v.). The females of many species, as of deer, are destitute of horns; and if they alone came under observation, it would be difficult to say to which genus they belonged. The size is very various; the Guevi, or Pigmy Antelope of Africa (*Antilope pygmaea*), is only 8 to 9 inches high at the shoulders, whilst the largest forms measure 5 or 6 feet. Almost all the species of antelopes are peaceable, timid animals, and are distinguished by agility and fleetness. Most of them are gregarious. Some inhabit plains; others are found only in the most inaccessible mountainous regions; whilst others dwell in jungles and deep forests. Many, on the other hand, are water-loving forms, and frequent the banks of rivers. North America possesses two species, found only in the western parts of the continent, the Prong-horn (*Antilocapra*) and the Rocky Mountain Goat (*Aptocerus*), which depart considerably from the typical character of the genus. It has been proposed to introduce the latter as a wool-bearing animal into the Highlands of Scotland. The Prong-horn sheds the horns annually like most species of deer. Europe produces only the Alpine Chamois and the Saiga (*A. saiga*), which inhabits the southern plains of Poland and Russia. Asia has about fifteen species; but the vast majority are found in Africa, and particularly in South Africa. The very numerous forms are arranged in sections or groups according to the peculiarities of the horns and other characters, but a satisfactory classification is difficult. The flesh of most antelopes is used for food, and they are therefore much hunted. In Africa some of the species exist in great numbers, and when severe drought occurs in the regions which they ordinarily inhabit, dense and multitudinous herds occasionally appear in the interior of Cape Colony, to the terrible devastation of the crops. Even the saigas of the Tartarian plains congregate in herds of many thousands in the end of autumn.

The name antelope is sometimes more particularly applied to a species also known as the Common or Indian Antelope, and as the Sasin. It is a native of India and the eastern parts of Asia, and is a beautiful animal about 2½ feet high at the shoulder, with erect, diverging horns, bent in a spiral of two or three turns. The hair is uniformly short, except that, as in many other species of antelopes, there are small tufts of bristles on the

knees. It inhabits open plains, and the herds exercise great watchfulness. Its fleetness is such that greyhounds chase it in vain; and it can easily bound over an inclosure of 11 feet in height, or over a distance of 10 or 12 yards. The flesh is held in small esteem, and the animal is less than many of its congeners an object of the chase.—The Saiga is a much less graceful animal, with short, somewhat lyre-shaped horns in the males only. These are used by the Russians and Chinese for the manufacture of many articles of domestic economy; and it is chiefly for their sake and that of the skin that the saiga is hunted, the flesh having a disagreeable taste, which is ascribed to the saline and aromatic plants of the steppes.—The Dzeren (*A. gutturosa*), sometimes called the Chinese Antelope, and known among the Chinese by a name which signifies the Yellow Goat, is an inhabitant of the arid deserts of Central Asia. The flesh is highly esteemed. It derives its specific name from a large movable goitre-like protuberance on the throat of the old males, produced by a dilatation of the larynx.—The Addax or Nubian Antelope (*A. addax*), which was known to the ancients, and is

Addax (*Antilope addax*).

mentioned by Pliny, has horns very similar to those of the Indian Antelope, but is a larger animal, less graceful, with a slight mane on the neck, a tuft of long hair on the forehead, and large broad hoofs, adapted for treading on fine and loose sands. It inhabits the deserts of Central Africa, and, contrary to the usual habits of the genus, is said not to be gregarious, but to live in pairs. The Chikara and some other Indian species are distinguished by two additional rudimentary horns in front of the ordinary horns, and immediately over the orbits. The chikara inhabits thick forests and jungles. Like the addax, it lives in pairs; as do also the Stein-bok of South Africa, an extremely graceful species, and the Kleene-bok of the same country (*A. perpusilla*), a beautiful and active little creature with very small horns. The kleene-bok is of a mild and gentle disposition, and extremely capable of domestication. The Gazelle (q.v.) of North Africa (*A. dorcas*), one of the species known to the ancients, is very frequently domesticated; and from its gracefulness of form, its gentleness of manners, and its bright black eyes, has afforded to the Arabian poets one of their most favourite objects of comparison. The South African Spring-bok (q.v.) is another very beautiful species, and is frequently domesticated by the colonists at the Cape of Good Hope. Among the numerous species which that country produces may

be mentioned also the Blauw-bok (*A. leucophaeus*), the Riet-bok (*A. arundinaceus*), and the Kaffrarian Oryx (q.v.). Still more worthy of notice among the South African species, but in some measure departing from the strict antelope type, is the Eland (q.v.), the largest of all the antelopes—an animal which may probably be found valuable in domestication. The Koodoo is another noble species allied to the eland. The Nyl-ghau (q.v.) of India and the Gnu (q.v.) of South Africa are also among the largest antelopes, but depart still further from the generic type. Less different from the ordinary type, but still with a marked approach to a bovine appearance, are the Bubalis of the ancients, frequenting the north of Africa, and the nearly allied Kaama or Harte-beest of the Cape of Good Hope. The flesh, skin, and horns of the antelopes have been widely utilised from early times. Antelopes may be grouped according to habitat, as desert, bush, rock, and plain forms. The Indian antelope has some religious significance, and the exaggerated development of a single horn in the Chinese antelope is supposed to have given some basis to the unicorn myth.

Antennæ, or feelers, the anterior appendages on the head of crustaceans, insects, and myriapods. The typical crustacean, such as a lobster, has two pairs of feelers, while insects and myriapods have only one pair. The name may also be applied to sensory processes on the head of some marine worms. They are really 'head-legs' modified for sensory purposes, and consist of a long series of joints, sometimes over 100 in number. They are supplied with nerve branches, and are used by the animals for feeling their way, for testing surrounding objects, and apparently for communicating with one

Various forms of Antennæ. (From Roget.)

another. Professor Graber has demonstrated the olfactory function of the antennæ of the cockroach, but some insects can smell their food even when robbed of their feelers. The smelling bristles of insects have been carefully studied by Braxton Hicks and Lowne in the case of the blowfly, where they occur very abundantly on the third joint of the antennæ. Peculiar sensory cones and knobs occur on the antennæ of some myriapods. The small antennæ of the lobster bear olfactory bristles, and have an ear lodged at the base. And in short there are numerous observations to justify the general statement that in many cases the antennæ are sensitive to smell, sound, and probably taste. Deprived of its antennæ, an ant, for instance, is peculiarly helpless.

Antequera (the *Antiquaria* of the Romans), an important town in the Spanish province of

Malaga, in a fertile plain on the left bank of the Guadalhorce, 65 miles W. of Granada by rail. Held by the Moors from 712 to 1410, it retains some portions of a commanding Moorish castle and of the ancient walls. It has a trade in oil and fruit, and some manufactures of woollens, silks, leather, and soap. Pop. (1884) 25,122.

Anthelia (Gr. *anti*, 'opposite,' and *hēlios*, 'the sun;'
Ger. *Gegensonnen*) are luminous rings seen by an observer on a cloud or fog which lies opposite to the sun. They occur chiefly in alpine regions and in the polar seas, and are only seen when sunshine and cloud, or fog, occur at the same time. They appear in the following way: When, from an elevated position—as the mast of a ship, or the ridge of a hill—the shadow of an observer is projected by the sun on a cloud or fog, he sees the head encircled by a glory or luminous ring, diminishing in brightness as it leaves the head as a centre. When the sun shines brightly, and the fog is dense, as many as four concentric rings of this nature are seen by the observer round the shadow of his head, having their common centre in the point where a line from the sun through the eye of the observer meets the fog. When the phenomenon assumes this form, the rings are more or less coloured—the colours of the two inner rings being generally brilliant, those of the third more faint, while those of the fourth are scarcely perceptible. This last has an angular radius of about 40°, and is very seldom seen. It bears frequently the name of the Circle of Ulloa or the White Rainbow. A phenomenon substantially similar to the anthelia occurs when, the sun being near the horizon, the observer sees an aureola surrounding the shadow of his head cast upon grass or corn moistened with dew. The occurrence of anthelia is generally attributed to the Diffraction (q.v.) of light.

Anthem, a shortened form of ANTIPHON (Gr. *anti*, 'in return,' *phonē*, 'voice;'
a piece sung in alternate parts), a species of musical composition introduced into the service of the English Church in the reign of Elizabeth, and appointed to be sung daily, at morning and evening service, after the third collect. The words of the anthem are taken from the Psalms, or other suitable parts of the Scriptures, and the music is either for solo, soli, or chorus, or a mixture of all three. As a specimen of English music, it can be heard to perfection in cathedrals and college chapels. In its origin, musical construction, and use, it is similar to the motett of the Romish Church, which name has been retained by the Lutheran Church. See MOTETT; also ANTIPHONY. The word is also loosely used, in such phrases as 'the National Anthem,' for what is rather a hymn.

Anthemis. See CHAMOMILE.

Anther. See STAMEN.

Antheridium, the male reproductive organs of many cryptogams (Ferns, Horsetails, Mosses, &c., q.v.). They may consist of a single cell, but are usually multicellular sacs, within which the thread-like male reproductive elements or antherozoids are produced. These are liberated by the rupture of the antheridium wall, and the antherozoid is enabled, by means of the lashing movement of its cilia, to reach and descend the tubular passage of the archegonium to the female cell, which it is its function to fertilise. See ALGÆ, FERN.

Anthology, from a Greek word meaning literally 'a collection of flowers,' is a title given to a work consisting of a series of choice thoughts, generally used solely of collections of poems. By far the most important is the Greek anthology, though the Latin anthology is also famous.

Greek Anthology.—The first Greek anthology deserving the name was compiled by Meleager of Gadara, in Syria, about 60 B.C. He called it a 'Garland' (*Stephanos*), and included in it poems by himself and forty-six earlier poets—Archilochus, Alceus, Anacreon, Simonides, Sappho, and others. This collection was added to by four successive editors, and in the 10th century Constantine Cephalas made a new collection, containing the best in the earlier ones, with some additions. Maximus Planudes, in the 14th century, by his tasteless selection from the work of Cephalas, rather spoiled than increased the already existing store; but his excerpt was the only anthology known in the West until the 17th century. It was printed at Florence by Lascaris in 1494 and frequently re-edited, and translated by Grotius. Meanwhile, Salmassius had discovered in the Heidelberg Library (1606) the only extant manuscript of the older and richer anthology of Cephalas, and copied it. The Heidelberg MS. was subsequently carried to Rome and Paris, returning to its old home in 1816. The anthology, as Salmassius copied it, was not published till it was included by Brunck in *Analecta* (1772-76); and this was superseded by the standard *Anthologia Græca* of F. Jacobs (13 vols. 1794-1803; improved in 1813-17). The edition in Didot's *Bibliotheca* (1864-72) is admirable. Good selections from the anthology are those of Weichert, Jacobs, and Meineke.

The Greek anthology contains specimens of 300 Greek poets at all periods of Greek civilisation—the old Hellenic, Alexandrian, and Byzantine, heathen and Christian—and is invaluable as a reflection of Greek thought, mainly in its most human side, illustrating, with a fullness not elsewhere found, domestic life and private feeling. Love songs, witty verses, and devout sentiment are found there side by side; the terse, pithy, dignified poem suitable for inscription (epigram in the old sense; see EPIGRAM) of the ancient time is followed by the florid, ornate writings of the later period. Nowhere is there to be found a richer variety of poetic life, greater delicacy of sentiment, a more joyous serenity, a greater abundance of wise, true, and humane thoughts, than sparkle in the pages of the Greek anthology. There are English translations of selections by Wrangham, John Sterling, Merivale, Macgregor, and Garnett. See the little work on the anthology by Lord Neaves; Symond's *Studies of the Greek Poets* (1873); A. J. Butler's *Amaranth and Asphodel: Songs from the Greek Anthology* (1881).

Latin Anthology.—The ancient Romans had no proper anthologies. In 1573, Scaliger published at Leyden, in imitation of the Greek anthology, a Latin anthology, under the title *Catalecta Veterum Poëtarum*, and Pitthöus one at Paris in 1590. A larger *Anthologia* was issued at Amsterdam (1759 and 1773) by Peter Burmann the Younger, a better arranged edition of which was published by Meyer in 1835. The first critical Latin anthology was that of Riese (1869-70), containing 942 poems of very various merit—some really admirable verses, and much that is artistically worthless.

Asiatic literature is extremely rich in anthologies, which consist sometimes of extracts from the best poets, arranged according to the subject, and sometimes of 'beauties' of their best poets, with biographical notices, which are either placed in chronological order, or according to the countries in which the authors lived. The Arabic, Persian, and Turkish literatures are rich in anthologies; there are also Tartar, Indian, and Chinese collections of a similar kind.

The Golden Treasury of the Best Songs and Lyrical Poems in the English Language (1861), by

F. T. Palgrave, is a brief but admirable English anthology; Archbishop Trench's well-known *Household Book of English Poetry* (1868) is another work of a similar kind. A larger selection is the *English Poets*, edited by T. H. Ward (4 vols. 1880).

AnthoN, CHARLES, LL.D., a well-known editor of classics, was born in New York in 1797. Educated at Columbia College, he was admitted to the bar in 1819; but next year was appointed adjunct-professor of Languages in Columbia College. In 1830 appeared his large edition of Horace. Five years later he became head of the classical department at Columbia College. A student of the most methodical habits, he was able to produce about fifty books, chiefly editions of the Latin classics and aids to classical study. His editions for a time were widely popular, even in England; more, however, from their superabundant explanations, with lazy schoolboys than with careful teachers. He died July 29, 1867.

Anthony, ST. See ANTONY, ST.

Anthozoa (Gr. *anthos*, 'a flower,' and *zoon*, 'an animal'), one of the three classes of Coelenterates (q.v.), including sea-anemones, dead-men's fingers, corals, &c. The commoner term is Actinozoa (q.v.).

Anthracene, ($C_{14}H_{10}$), is a substance obtained in the distillation of coal-tar. Although long known to chemists, it is as the source of artificial Alizarin (q.v.) that it has become of commercial value. By a process of oxidation with bichromate of potash, it is changed into anthraquinone, which in turn is treated first with sulphuric acid and then with potash, the alizarin being separated by the addition of hydrochloric acid. Conversely, anthracene is readily obtained from alizarin by heating that substance with zinc dust—a mixture of metallic zinc with oxide and hydrate of zinc—when, by the absorption of hydrogen, anthracene is formed. When perfectly pure, it forms white pearly scales, melting at about 410° F. (210° C.), and at a higher temperature distilling without decomposition. It is insoluble in water, but readily dissolves in boiling alcohol, ether, or turpentine. When viewed by a ray of sunlight, it exhibits a fine blue fluorescence, if pure. The commercial article, dissolved in benzene, gives a green fluorescence. By prolonged exposure to light, it is changed into an isomeric body, *paranthracene*, which again on fusion yields anthracene. Anthracene gives rise to a large number of compounds, formed by replacing part of the hydrogen which it contains with chlorine, alcohol radicals, &c., and accordingly named chloranthracene, methyl-anthracene, and so on.

Anthracite (Gr. *anthrax*, 'a coal'), or **STONE COAL**, is black, has a kind of iridescent or metallic lustre, is not readily ignited, and burns nearly without smell, smoke, or flame (hence, sometimes called *blind-coal*), giving out an intense heat. It consists almost entirely of carbon, and contains only a small proportion of the constituents of bitumen. It occurs in beds like common coal, and has doubtless had a similar vegetable origin. Common coal which has been subjected to the action of heat underground, loses its bituminous constituents and passes into anthracite. Thus many coals have been rendered anthracitic in the neighbourhood of intrusive igneous rocks. Anthracite is used for fuel like coke; it is in fact a kind of natural coke. It is employed in the burning of lime and bricks, the reduction of iron, &c. It is found largely in South Wales, and here and there in Scotland. The largest field of anthracite is in the coal-region of Pennsylvania. See **COAL**.

Anthrax (Gr., 'a carbuncle'), the name now generally used of a widely-distributed and very

destructive disease, most common among sheep and cattle. Besides its practical importance, it has special theoretical interest, because it was the first infectious disease proved to be due to the presence of microscopic vegetable organisms (*bacilli*; see GERM THEORY), and because it has been more fully studied than any other analogous disease.

Synonyms and Distribution.—Anthrax has received many names; the most important are *Splenic Apoplexy*, *Splenic Fever*; as it occurs in man, *Malignant Pustule*, *Woolsorter's Disease*; in French, *Charbon*, *Sang de Rate*, *Mal de Sang*; in German, *Milzbrand*. It occurs in most countries of Europe, especially France, Germany, Austria, and Italy; in Turkey in Asia, Persia, China, South Africa, and South America; in Siberia, chiefly among horses, as *Siberian Plague*. The *Loodiana Fever* and *Pali Plague* of India, and the disease which was very fatal to horses and cattle in the Zulu war, are closely allied, if not identical. The disease of cattle called *Black-leg* or *Quarter Evil*, though very similar, is now proved to be distinct from anthrax.

Animals affected.—Cattle and sheep are most commonly attacked by anthrax. Among horses and camels it is also very destructive. Rabbits, hares, mice, guinea-pigs are readily affected, and probably many other herbivorous mammals. It has been found that rats are susceptible to it when fed on vegetables, but not when on animal diet; and probably food has a similar influence in man. Carnivorous animals become affected with difficulty, if at all. Fowls can contract it, but only when their temperature, naturally higher than that of mammals, is artificially reduced.

Symptoms in Animals.—In the most acute (*apoplecticiform*) cases, the animal falls as if it had received a severe blow, and goes into convulsions; the pulse is quickened, the breathing becomes rapid and laboured, and death follows in a few minutes or hours. In less acute cases, the animal loses its appetite, becomes thirsty and feverish, and often has bloody diarrhoea; may appear to recover, only to have a more severe seizure after a short interval; and in a fatal case dies with great enfeeblement, convulsions, and laboured breathing, usually within two days of the first symptoms.

Occurrence and Symptoms in Man.—Anthrax does not readily attack man, and is very rarely communicated by one human being to another. It occurs in those whose occupations bring them into contact with diseased animals or their hides, wool, &c.—i.e. butchers, farriers, porters, &c. In this country, the source of infection is generally imported wool or hides. Two distinct forms are met with: (1) *Internal Anthrax*, or *Woolsorter's Disease*; (2) *External Anthrax*, or *Malignant Pustule*. (1) Peculiar cases of rapid fatal illness had long been known to occur in those employed among wool from abroad, especially at and near Bradford, but were first identified with anthrax in 1879. The symptoms are much like those in animals, but less rapid; 'apoplecticiform' cases are very rare, and death usually occurs between the third and seventh day after the first severe symptoms. In such cases the poison is probably inhaled, and enters the blood from the respiratory organs. (2) In *External Anthrax*, the poison is introduced through an abrasion or wound of the skin. The disease begins as a small red spot, but soon leads to destruction of the portion of skin involved, and inflammation of the surrounding tissues. The affected part now forms a defined hard lump surrounded by a soft swollen area of skin. There is a singular absence of pain and suppuration, which distinguishes it from the ordinary forms of inflammation. Within a few days of the first appearance of this *malignant pustule*, constitutional symptoms may

set in and run much the same course as internal anthrax. But at first the disease is a purely local one, and energetic treatment by excision or cauterisation of the affected tissues will prevent its becoming general, and save the patient from a probably fatal issue.

Post-mortem appearances vary much in detail in different animals. Generally speaking, the blood is dark and uncoagulated; most of the internal organs, particularly the spleen, are swollen and congested; jelly-like infiltrations, either yellow or in large measure composed of blood, are found in various situations, particularly where there is much loose connective tissue—e.g. beneath the peritoneum; there are hemorrhages into the tissues; and often fluid effusions in the serous cavities. On microscopic examination, the capillaries in affected parts are found distended with blood containing abundant *bacilli*; and the kidneys, spleen, &c. are inflamed.

Bacillus Anthracis.—The characteristic organism, the bacillus, which is the cause of this disease, consists of straight or slightly curved rod-shaped bodies, usually about 0.001 millimetre ($\frac{1}{1000}$ in.) in thickness, and from 0.005 to 0.02 millimetre ($\frac{1}{200}$ to $\frac{1}{50}$ in.) in length. They are composed of a number of joints, rather longer than broad, each of which consists of an envelope with protoplasm in its interior. The rods increase in length by transverse division of these cells, never become branched, and are motionless. When they are exposed to the air (not within the animal body), bright glistening oval spores may be seen to develop within some of the cells. The bacilli can grow in any fluid containing nutritive material, and at any temperature between 15° and 45° C. (60° and 113° F.), best between 25° and 40° C. (77° and 104° F.). Provided air has free access to the bacilli, spores may form at any of these temperatures. While the bacilli themselves are readily killed by freezing, boiling, complete drying, or the action of antiseptics, the spores are extremely tenacious of life, and dry wool, blood, &c. containing them probably retain their virulence for years.

Preventive Inoculation (badly named 'animal vaccination').—In 1881 Pasteur announced that by cultivating this bacillus at 42–43° C. (108° F.), he was able to obtain a form which produced a modified anthrax in sheep and cattle inoculated with it, much less virulent and fatal than the ordinary disease; and that the animals thus treated were proof against the ordinary anthrax poison. The previous year Toussaint obtained similar results by a slightly different process. Subsequent experimenters have not fully confirmed Pasteur's results; but his method is largely employed on the Continent, frequently, though not always, with success. He stated in 1886 that half a million animals are inoculated annually for anthrax in France alone. Klein has found that the blood of white mice killed by anthrax produces a mild protective attack in sheep. Roy obtained similar results in the case of cattle and horses (but not sheep), with blood from the biscacha or prairie-dog, when investigating the disease in the Argentine Republic in 1883. Among other difficulties in the way of accurate results is the very different susceptibility to the disease even of different breeds of the same species of animal; e.g. one breed of sheep may be killed by a virus which produces a mild protective attack in another. At best, moreover, the immunity conferred by inoculation seems not to last more than a year.

These facts, and somewhat similar results obtained by inoculations in the case of other infectious diseases of animals (black-leg, chicken cholera, pleuro-pneumonia, or foot-and-mouth disease), have special interest from the analogies they present to smallpox and its prevention by vaccination, and

seem to point to indefinite possibilities in regard to methods of dealing with other similar maladies. See Reports of Medical Officer to Local Government Board for 1880-81-82-83; Koch *On Traumatic Infective Diseases* (1880); Klein in *The Practitioner* for 1884.

Anthropoid Apes, the highest and most man-like monkeys, including Gorilla, Chimpanzee, Orang-utan, Gibbon, and several other species. They are technically described by the Linnæan title Anthropomorpha, and readily distinguished, as tail-less, semi-erect, and long-armed, from the dog-like apes (Cynomorpha), which have also a narrow partition between the nostrils (Catar-

rhini), and also inhabit the Old World. With the decidedly lower flat-nosed New-World monkeys, or Platyrrhini, there is no possibility of confusion. The anthropoid apes are all arboreal, and inhabit Africa, South-eastern Asia, and the Malay Archipelago. In all, about a dozen species have been described with more or less definiteness. The family is of special interest and importance in connection with the views held by evolutionists as to the descent of man. It is recognised by anatomists that all the attempts to establish a fundamental distinction, on anatomical grounds, between the physical structure of the higher apes and that of man are futile. Generic differ-

Skeletons of Anthropoid Apes compared with that of Man :

G, gibbon (for distinctness, given about twice the proportional size); O, orang-utan; C, chimpanzee; Go., gorilla; M, man. (After Huxley.)

ences, indeed, there are in abundance, but these establish only a difference of degree, and not of kind. Thus, in man, the great toe is not opposable to the others for grasping purposes, the angle between the face and the top of the skull does not exceed 120° , the teeth form an uninterrupted series, and so on; while the strong spines on the back of the gorilla's neck, the very marked eyebrow ridges in gorilla and chimpanzee, the especially long arms of the gibbon, and the protruding jaws of all the anthropoids, are equally characteristic adaptations to different ways of life. Even in the minutiae of blood-vessels, muscles, nerves, and brain-convolutions, impartial observers have demonstrated the closest resemblance. The differences of structure between the lowest monkeys and the higher are far greater than those between man and any anthropoid ape, the resemblances being especially obvious when young forms are compared. In their expressions of cerebral activity, whether intellectual or emotional, the anthropoids come in some respects very near the lowest human tribes.

On the other hand, while it is impossible to establish any fundamental distinction in physical structure between Homo and the Anthropomorpha, there is among evolutionists an equal consensus of opinion as to the impossibility of regarding an ape of any existing anthropoid species as in the direct line of human ancestry. As regards brain-structure, the most man-like ape is the orang, while the chimpanzee has the most closely related skull, the gorilla the most human feet and hands, the gibbon the most similar chest. The study of anthropoid fossils has not yet discovered the remains of any form which can be accepted as the 'missing link,' although extinct anthropoids, such as *Dryopithecus*, unquestionably serve to lessen the distance to

be bridged over. The reader should consult Darwin's *Descent of Man*, Haeckel's *Anthropogeny*, Huxley's *Man's Place in Nature*, and Hartmann's *Anthropoid Apes* (Internat. Sc. Series), where abundant references will be found. See also EVOLUTION, MAN (*Descent of*); and APE, CHIMPANZEE, GIBBON, GORILLA, MONKEYS, ORANG.

Anthropolatry (Gr., 'man-worship'), the worship of man, the giving of divine honours to a human being, a term always employed in reproach. Thus, the early Christians accused the heathens of anthropolatry, because, in their mythology, men were represented as exalted among the gods, although an *Apotheosis* (q.v.) was in these cases alleged by their worshippers; and the heathens retorted the charge because of the worship of Christ, the reply to which was the assertion of his divinity. But the term is chiefly known in ecclesiastical history in connection with the employment of it by the Apollinarians (q.v.) against the orthodox Christians of the 4th and 5th centuries, with reference to the doctrine of the perfect human nature of Christ.

Anthropology is the science of Man, and more especially of man considered as a social animal.

Strictly speaking, there can be no one science of man: various parts of our knowledge of our own species fall under the head of various distinct sciences. For example, viewed as an animal organism merely, the scientific consideration of man's body belongs to the province of Biology, and in particular of that branch of it known as Zoology. Again, man's structure and functions, regarded separately, belong to the province of Anatomy and of Physiology. His mind and all his mental phenomena fall similarly under the head of Psychology. The facts and theories as to his speech

and languages range themselves under the subordinate science of Philology. And so forth throughout. Nevertheless, from two distinct points of view, it may be fairly urged that a single unified science of anthropology does and ought properly to exist. In the first place, man is of immense relative importance to man; and on this ground alone it has been held desirable that the principal facts as to man's nature, origin, and history should be considered in their totality at a single glance, and with special reference to himself alone. In the second place, man is an animal so complex, so varied, so superior to all the other animals, that many aspects of his life must be scientifically examined, which do not exist at all, or exist only in a very slight degree, in the case of all other groups of organisms. More especially may it be asserted that man, as a social animal, enters into mutual relations of such unusual complexity, whether in the family, the clan, the tribe, or the nation, that a special science is imperatively needed to take cognisance of these higher social phenomena. For this science, Auguste Comte, one of the first who recognised its necessity, proposed the name of Sociology (q.v.), a name since adopted by Mr Herbert Spencer and other high authorities.

As to man's origin, two main views may be said at present to contest the field. The one, heretofore the usual belief, is based either upon the literal interpretation of Scripture or upon natural theology, and regards him as a distinct creation, separate from and superior to the remaining animals. The other, accepted by many competent biological authorities, regards him as descended from a hairy quadrumanous arboreal animal, more or less remotely allied to the anthropoid apes. This theory of his antecedents, faintly foreshadowed by Lord Monboddo in the 18th century, was more definitely propounded a little later by Buffon, Helvetius, Lamarck, and Erasmus Darwin, and was at last elaborated in profuse detail by Charles Darwin, whose *Descent of Man* forms the great storehouse of information and speculation on the question. Huxley's *Man's Place in Nature* may likewise be consulted on this branch of the subject, as may also Lyell's *Antiquity of Man*, and Dr E. B. Tylor's *Anthropology*. The other side of the question is ably argued in A. de Quatrefages' *Races Humaines* (Par. 1887). His view, till recently the only theory of man's origin, is still the one mainly accepted by orthodox thinkers, and supported by several biological specialists. As regards the period of man's first appearance on the earth, that problem must be, from the evolutionary point of view at least, to some extent a merely verbal one; because if man be really developed from some lower form, there could never have come any particular moment in the course of his evolution when he began to be a man, and ceased to be a man-like ape. But beings who were undoubtedly men in the fullest sense are known to have existed in Quaternary times; while much evidence has been adduced for pushing back the advent of man on earth to the Pliocene, and even to the Miocene period. On this point, however, see MAN (*Antiquity of*).

When man first appears before us in recognisable form, he appears as an erect animal, intelligent and social, endowed with articulate speech, and capable of manufacturing weapons and implements of stone, bone, wood, and other like materials. All questions as to how, on the evolutionist theory, he acquired the erect habit, already partially foreshadowed in the anthropoid apes, and how he lost the hairy covering of his body, belong strictly to the domain of anthropology, and have been argued out by Darwin, Huxley, Wallace, and others. For the peculiarly human gift of articu-

late speech, often regarded as the absolute differentia of humanity, see LANGUAGE. The unusual intelligence and mechanical ability of man are closely correlated with his large brain; and the oldest skulls yet discovered show that this exceptional development of the brain dates back to a very early period. Similarly, it is for the most part by his works and tools, indicating a high degree of intelligence, that we trace the existence of man in geological time. The fire-marked stone implements from the Calcaire de Beauce, regarded by the Abbé Bourgeois and M. Gabriel de Mortillet as of human origin, perhaps afford the first indications of his presence in Tertiary times; the Quaternary cave-deposits and the drift yield stone-hatchets and arrow-heads of more shapely make, and artistic remains of primitive pictorial type far from despicable (see ARCHÆOLOGY and ART).

From the very beginning, man thus shows himself as emphatically a possessor of arts and knowledge. He alone can produce fire; and this acquaintance with fire and with the art of cooking has also frequently been regarded as the most distinctive characteristic of the human race. Fire was probably first obtained either from flint sparks, which would be observed in the act of chipping stone implements; or by means of the fire-drill, which would immediately be suggested in the act of drilling bone-needles (such as were used by the cave-men), or in the course of manufacturing shafts for arrow-heads. Clothing and decoration are also early peculiarities of man. Alone among animals, he covers himself with the skins of the beasts he has slain, and adorns himself with feathers, shells, teeth, and bones. From these simple beginnings, all the arts gradually arise. Implements slowly differentiate themselves with use into weapons on the one hand, and tools on the other. The earliest stone-axe, held apparently in the hand alone, without hafting, yields place with time to its more developed varieties, the hafted axe, the scraper, the chisel, the gouge, the drill, the arrow-head, and the lance-head, all alike chipped in stone; and these, once more, by slow degrees, give way to the newer ground and polished neolithic weapons and tools, and finally to metallic implements generally. The dug-out canoe, in like manner, leads on to the coracle, the bark canoe, the boat, the ship, and at last the steamer. Clothing sets out with skins and necklets; it quickly reaches the stage of grass kirtles and feather cloaks; and as soon as the art of weaving is discovered, it goes on to linen, cotton, silk, and velvet.

According to the more general theory of creation, man's first home was in Eden, the position of which has been greatly debated. But if we accept the evolutionary view, man perhaps had his origin in the torrid region of Asia or Africa, still the home of the anthropoid apes; for the tropics are the headquarters of the Primates, and the fossil fauna of Europe is poor in Quadrumana, while those of America and Australia do not exhibit their remains at all. In the beginning, according to their theory, man was apparently homogeneous—a single species, speaking a single primitive rude tongue (largely eked out by signs and gesture-language), and not divided into distinct varieties. At an early period, however, the species broke up into several races, now inhabiting various parts of the world, for which see ETHNOLOGY. It is a peculiarity of our species, indeed, to be strictly cosmopolitan, inhabiting all climatic zones, and found in every portion of earth except a few oceanic islands; and this universal diffusion has doubtless largely influenced race-characteristics, and by the separation it involves, has greatly increased the number and variety of anthropological problems. Similarly, it

has given rise to the immense complexity of existing languages, for whose classification and affinities see PHILOLOGY. In various countries, man, under the influence of the physical and social environment, has developed diversely; has organised his family and his government on different models; has domesticated different animals—here the sheep and cow, there the horse and camel, yonder again the llama and alpaca; has cultivated different plants; has evolved different arts and sciences. The consideration of these diverse developments belongs strictly to the domain of anthropology.

In his earliest state, man appears to have been a hunter and a fisher; in the Quaternary caves, his remains are associated with harpoons and fish-hooks, and with the bones of the animals he employed for food. But he was also probably to a great extent dependent for support upon fruits and leaves, roots and seeds. This is still the condition of the lowest savages, of the Andaman Islanders, the Digger Indians, the Australian black-fellows, and the Melanesian Negritos. The Australian has for his chief weapon and hunting instrument the Boomerang (q.v.); he digs the ground with a pointed stick for tubers, roots, and a kind of large truffle. From this earliest and lowest stage we get advance first in the direction of the higher hunter life, represented by the Quaternary cave-men and the modern Eskimo, who fashion shapely harpoons for seal or walrus, frame themselves canoes of some skill, and dress from head to foot in furs neatly stitched together into good garments. The next advance is to the rudiments of agriculture, already shown in the lake dwellings of Switzerland, where the remains are found of several cereals inferior in size to those of the present day. It is usual, indeed, to divide the history of mankind into three stages, the hunting, the pastoral, and the agricultural; and this division is on the whole good. But rudiments of agriculture seem in most cases to antedate the pastoral condition. Even the Melanesians cultivate small plots of yam and taro. The North American Indians, before the arrival of Europeans, were mostly still in the hunting stage; on the prairies, they depended chiefly for support on the bison; farther north and east, on the deer, elk, and other forestine animals. But in Mexico, maize and cassava were tilled; and in Peru, the potato formed the staple food, while the llamas and alpacas were used both for burden and food. The earliest known domestic animal was the dog, found in Australia and in the Danish shell-mounds; next, perhaps, came the pig, found in Polynesia; then the reindeer; later, the sheep, cow, horse, goat, camel, elephant, yak, and cat. The nomad Mongolian of Central Asia lives mainly on the produce of his flocks and herds, especially mare's milk. Agriculture is found even in New Caledonia, where the natives cultivate local roots; throughout Polynesia, the cocoa-nut and the bread-fruit long formed the staple food; in the Malayan region, the banana (now universally raised in tropical climates) was the main staff of life. Yam, sweet potato, sago, and sugar-cane are also important tropical esculents. In Europe and Asia, the cereals, especially wheat, oats, rye, rice, barley, and millet, form the chief agricultural products. Dates and sorghum are of great value in Africa. On the rise of tillage, see De Candolle, *Origin of Cultivated Plants*; on the domesticated animals, Darwin, *Variation under Domestication*. Agriculture began in small plots worked by hand and spade, or stick; it progressed next to the wide valleys of the Nile, the Euphrates, the Ganges, the Indus, and the Chinese rivers. It owes much to the invention of the plough. Cookery, fire, the art of grinding, the mill, the flail, the thrashing-machine, the winnowing-machine, all

contribute their share to the gradual building up of civilisation.

Man alone also indulges in intoxicating, stupefying, or exciting substances, such as alcohol (in its various forms of wine, beer, whisky, koumiss, &c.), tobacco, bhong, opium, hashish, kava, and coca.

In the material life of man, the most important element, after food, is that which relates to warmth and shelter—the house, clothing, fire, and covering. Caves and rock-shelters seem to have formed the earliest houses; upon these, the wigwam of leaves and branches is a natural advance among forestine peoples. Some few wild races still live and sleep entirely in the open air, but most human beings have at least a temporary place of residence, a tent, van, wigwam, cabin, crannog, or snow-hut. Architecture is concerned with the evolution of these to the modern mansion, palace, or cathedral. Clothing originated, it would seem, in ornament, but its use for warmth must also have come very early. A few savages still go stark naked, and so apparently (to judge from their sketches) did the men of the older stone age; but the loins, at least, are generally clad, and among higher races the whole body also. Painting and tattooing, though solely decorative in character, may likewise be considered under this head, as well as the deformations and mutilations of various parts of the body, frequently practised by many savages. These, though originally perhaps (as Mr Herbert Spencer believes) ceremonial or religious in character, have now, for the most part, assumed a purely tribal or æsthetic meaning. Important in the same general connection is the evolution of household furniture; a bed of some sort, be it only of grass or dead leaves, seems all but universal among human beings; the stool or chair is almost equally ancient; coverlets, blankets, sofas, and so forth, gradually follow. The fire and cookery imply some sort of rude vessels; at first, no doubt, calabashes and cocoa-nuts, gourds and skins, horns and skulls; then at last Pottery (q.v.), moulded originally as moist clay round natural forms to prevent them from burning when placed upon the fire, and at last assuming the definite shape of an independent art. On the evolution of these, as of jewelry, hair-dressing, and other similar domestic arts, see in details under those various headings.

Among the practices most distinctive of man may be reckoned war; for though the lower animals fight among themselves, they seldom do so in organised bodies. War is a result of the social habits of man, and itself has been instrumental in bringing about many of the higher human developments. Besides its direct effect in producing the gradual evolution of weapons (as distinguished from tools), setting out with the stone axe, and ending with the Armstrong gun, the rifle, and the ironclad, it has had an immense indirect effect in begetting civil organisations, welding together men under military discipline, determining the monarchical form of government, and consolidating independent tribes and nations under one great centralised despotism. War is also probably answerable for the institution of slavery (the slave being at first the captive in battle), as well as for the existence of caste and many other social distinctions. It seems likely that cannibalism is a direct result of war; and at least one great military despotism, that of Mexico (q.v.), was absolutely founded upon cannibalism, which there assumed a marked governmental and religious importance.

The question as to the rise of marriage and of the family life forms another large department of anthropology. Promiscuity, or so-called communal marriage, seems, according to recent investigators, to have been the aboriginal practice of savage men. From this natural state, two main lines seem to

diverge. Where female infanticide is practised, the number of women becomes insufficient for the men, and polyandry is the result. But elsewhere, starting from so-called marriage by capture, where each man stole a woman for himself from another tribe, we get evolved the more familiar polygamous or monogamic family. The problems of anthropology in this respect, the varieties of exogamy and endogamy, the rise of polygamy, and its gradual evolution into monogamy, have been traced in M'Lennan's *Primitive Marriage*, Morgan's *Systems of Consanguinity and Affinity*, Tylor's *Primitive Culture*, Herbert Spencer's *Principles of Sociology*, and Letourneau's *Sociology*. Closely connected with this aspect of the subject are all questions as to the position of woman, her legal and social status; the constitution of the family, patriarchal, matriarchal, or slave-owning; the various methods of reckoning kinship; prohibited degrees; the claims of the children; divorce, widowhood, second marriage, and the practice of suttee. Among the more interesting of these developments may be mentioned Totemism (q.v.), a subject largely elucidated in Mr Andrew Lang's *Custom and Myth* (1884), and *Myth, Ritual, and Religion* (1887).

The exact relations of the family to the tribe remain open to much doubt. But almost everywhere human society, in its early stages, resolves itself into such little groups, more or less loosely held together, and occupying, as a rule (except among nomads), a definite and circumscribed piece of territory. The tribe is least marked among the lowest races—the Veddahs of Ceylon, the Andamanese, the Eskimo, who exist almost as families alone, without subordination or headship; it gradually expands, as we move upwards, into the nation, the kingdom, and the empire. The earliest tribes are kingless and formless; they have no definite organisation. But war usually produces kingship, and in tribes that have long been predatory and militant in type, the kingship hardens into a fixed despotism. The various influences of militancy and industrialism, the growth of the different types of government, and the rise of free institutions and of legislative bodies, have been admirably traced in Mr Herbert Spencer's *Principles of Sociology*. In his *Ceremonial Institutions* he has also shown the importance of that system of etiquette which rules the lives of men in all societies from day to day, and constitutes in its own way a form of government scarcely less imperative than the political authority. The manners and customs of savage and semi-civilised people, often very extraordinary and disgusting, form a large department of anthropological science. Law is also a branch of sociology to be affiliated here; and the growth of the idea of property belongs similarly to this part of the science of anthropology. Sir Henry Sumner Maine's works may be consulted upon this subject.

Man is one of the few animals to pay special attention to his dead. Funeral rites differ much from place to place, and form a special subject of anthropological study. Tumuli, pyramids, standing-stones, and other forms of funeral monument, have each their history and implications. Especially does man almost everywhere believe in some sort of survival of the individual after death, and in the existence within himself of a soul or spirit, which outlives its fleshy habitation. The origin of Religion (q.v.) is largely connected with these ideas of a future life and a future world. Herbert Spencer traces it directly to the theory of ghosts and ancestor-worship; Dr Tylor, to what he calls Animism (q.v.), or the belief in souls universally pervading all natural objects. At anyrate, anthropology has to deal on this side with the growth of worship, of the fetich, of the ghost, and of myth; the ideas of gods, demons, and

supernatural beings generally; the rise of altars, temples, mosques, and churches; the notion of sacrifice; and the various great creeds of the world—heathenism, fetichism, Shamanism, Hinduism, Shintoism, Buddhism, Judaism, Islam, and Christianity. A special side of this department of anthropology is Comparative Mythology (q.v.). Max Müller's works present one aspect of this subject; Lang's *Custom and Myth*, and *Myth, Ritual, and Religion*, Clodd's *Myths and Dreams*, and Spencer's *Sociology*, show the other.

Ethics and moral philosophy are from this standpoint a branch of anthropology, touching on the one side upon religion, and on the other side upon law and the social relations. Political economy may also be regarded as a closely allied branch of anthropological science.

Finally, aesthetics, and the history of the arts and sciences, have themselves their anthropological aspect. The history of civilisation; the art of dancing, and of vocal and instrumental music; painting and sculpture; architecture; decoration; navigation; communications; education; picture-language, hieroglyphics, and alphabetic writing; in short, all that specially appertains to human life, savage or civilised, ancient or modern, all the world over, falls somewhere into its proper place as a part of anthropology.

For the general study of the subject, see especially the writings of Broca, regarded by many as the real founder of anthropology; Lubbock, *Prehistoric Times* (1865), and *Origin of Civilisation* (1870); Tylor, *Researches into the Early History of Mankind* (1865), *Primitive Culture* (1871), and *Anthropology* (1881); Bagehot, *Physics and Politics* (1872); Herbert Spencer, *Principles of Sociology* (1876 et seq.); Letourneau, *Sociology* (Eng. trans. 1877); Waitz, *Anthropologie der Naturvölker* (vols. i-iv. 1859-65; vols. v-vi. by Gerland, 1867-71); and the *Dictionnaire des Sciences Anthropologiques* (1882 et seq.). Special journals are the *Zeitschrift für Ethnologie*, founded 1868; *Revue d'Anthropologie*, founded 1865. The London Anthropological Institute issues *Memoirs* and other authorised publications. For works on the various particular branches, see separately under the special headings.

Anthropometry, the measurement of the human body to discover its exact dimensions and the proportions of its parts, for comparison with its dimensions at different periods, or in different races or classes. Cranial measurements have long been adopted by anthropologists as the basis of their classifications of races; but the conformation of the skull and the relation of its height to its breadth vary so much within the same tribe, as not to be of themselves sufficient data on which to rest generalisations. M. Quetelet defined the general types of mankind by measuring, with reference to such particular qualities as height, weight, complexion, and the like, a certain number of men, and selecting as the standard the most numerous group on both sides of which the groups decrease in number as they vary in type, he arrives at the typical *mean* man of a population. As a basis of comparison, this is infinitely more valuable than an average which may be calculated from a few individuals, and those frequently exceptional rather than normal types. See Quetelet's *Anthropométrie* (Brussels, 1871). The French anthropologists depend much more on anthropometry than the English, and have adopted a form of schedule containing as many as 102 different observations of a single individual. Dr René Collignon reduced these for practical use to about 20, and with five simple instruments made a series of anthropometric observations of 280 French recruits from the different provinces of France, which he read before the Society of Anthropology at Paris in June 1883—an excellent example of the value of this method. The 'anthropometric committee' of the English Anthropological Society

distributed the average stature of British adult males into racial elements as follows: Early British, 66·6 inches; Saxon, 67·2; Scandinavian, 68·3; Anglian, 68·7. Similar detailed anthropometric measurements will be seen in the special anthropological journals, French, English, and German, and in the more scientific of recent books of travel. At his 'anthropometric laboratory' in the London Health Exhibition (1883-84), Mr Francis Galton made seventeen different measurements of 9337 individuals, and afterwards laid his methods and results before the Anthropological Institute.

Anthropomorphism (Gr. *anthrōpos*, 'man,' and *morphe*, 'form'), the application, in a figurative way, to God, of terms which properly relate to human beings. Thus, in the Scriptures, we read of the eye, the ear, the arm, the hand of God; and of his remembering and forgetting. This appears to arise of necessity from our incapacity of forming conceptions of things spiritual, or finding any terms in which to express them, except by analogies derived from things cognisable by our senses, so that even the language of adoration is borrowed from the familiar things of this world. Anthropomorphism, too grossly understood, has led at various times in the history of the Christian Church to the form and parts of man being ascribed to the Divine Being. Thus the Audæans, a Syrian monastic sect which sprang up in the 4th century, were accused of holding that God was possessed of a human shape, and that the words 'God created man in his own image' are to be understood of this shape literally. The language of the Mormons is highly anthropomorphic. A tendency to anthropomorphism may indeed be regarded as always existing, and to a certain extent it is true that the human mind must rest on human analogies in its highest abstractions. Limiting the question for the sake of argument to natural grounds alone, we must explain not a little of the great success of Christianity in the history of the world to the marvellous manner in which the divine is unfolded through the human in the central figure; and such phenomena as apotheosis and canonisation, to say nothing of the cruder animism of less civilised conceptions, still show how natural and easy it comes to us to express the divine in terms of the human. Such a representation of the divine, moreover, has found countenance from the speculations of philosophers. Hobbes and Priestley ascribed to the Divine Being a sort of subtle body. Fichte, on the other hand, rejected the very doctrine of the personality of the Divine Being as anthropomorphic, and represented God as the moral order of the universe; Spinoza was resolutely anti-anthropomorphic in all his thoughts of God; and Feuerbach substituted for the objective personality of God a subjective consciousness of God in the human soul.—The term *Anthropopathism* is sometimes employed to denote the ascription to God of human affections and passions, though indeed this is really included in the more general term. The language of Scripture, in the many instances of this kind, must be interpreted according to the same general principles which are applicable in those of anthropomorphism strictly so called, with the same discrimination of the figurative from the literal, and the same constant recognition of the absolute spirituality of God.

Antibes (anc. *Antipolis*), a fortified seaport in the French department of Alpes Maritimes, 7½

miles S. of Cannes. The harbour is serviceable only for small craft. It is a military station of the third rank, possesses a naval school, and has considerable trade in anchovies, olives, dried fruits, salt-fish, oil, &c. Pop. (1881) 4565. Antibes is a very old place, having been founded by a colony of Greeks from Massilia (Marseilles), of which it was a dependency. In the time of Augustus it was elevated to the rank of an Italian city, and many ruins still testify to its ancient prosperity. In the Austrian War of Succession, it was severely bombarded by Browne during a three months' siege (1746). The *Antibes Legion*, a body of foreign troops, chiefly French, kept by the pope during the French occupation of Rome, was formed here.

Anti-burghers. The name of a former religious denomination in Scotland. See UNITED PRESBYTERIAN CHURCH.

Antichlor was the name formerly applied to commercial sulphite of soda by paper-makers, but now usually restricted to hyposulphite of soda. When the rags are reduced to a pulp, they are bleached by chloride of lime (bleaching-powder), which thoroughly soaks the pulp, and is very difficult to wash out. The traces of chlorine thus left in the pulp pass into the manufactured paper, and tend to bleach the writing-ink which may be traced thereon. To free the pulp from the residue of the chlorine, some hyposulphite of soda is employed, and hence the name antichlor, which literally signifies 'against (*anti*) chlorine.'

Antichrist, a name which occurs only in the epistles of St John, and is identified by different writers with more or less probability with false Christs, and other enemies of Christianity. The Greek preposition *anti* has the twofold meaning of substitution and of opposition; and the two meanings of a rival of Christ or pretender to the Messiahship, and an opponent, are mixed up in the early Christian conceptions of antichrist, in which various stages of development are to be distinguished.

(1) The 'false Christs,' whose appearance was predicted by Jesus as to precede the coming of the Son of Man (Matt. xxiv.), were pretenders whose success would depend on their acting in harmony with the popular expectations regarding the Messiah, but showing no special opposition to the Gospel. There is nothing peculiar to Christianity in this idea, for a number of pretenders to the Messiahship appeared among the Jews, both before and after the time of Christ. The other idea of opposition on the part of an antimessiah was also a familiar one (cf. 1 John, ii. 18). Its earliest form in Jewish thought is probably that of a warrior-king, Gog (Ez. xxxviii.). To this were subsequently added, by the rabbinical imagination, features borrowed not only from Antiochus Epiphanes, who is depicted in the book of Daniel (ii. viii. xi.), and who was regarded as the type of enmity against the kingdom of God, but from all the Old Testament enemies of Israel—Balaam, Goliath, &c.—and even from oriental myths and traditions; all combined and personified under the name 'Armillus.' In reference to the after-development of the Christian conception, it is to be noticed that the false Christs of Matt. xxiv. are Jews, who by their pretensions are to bring trouble upon their nation.

(2) The development of this conception is apparent in the epistles of St Paul, inasmuch as the element of hostility to the Gospel is distinctly present. The apostle to the Gentiles had to bear the brunt of Jewish opposition (cf. 1 Thess. ii. 15), and the 'Man of Sin,' in whom this opposition came to a head, can only be a Jew, since he regards the temple at Jerusalem as the seat of God's worship

(2 Thess. ii. 3, 4); whilst the Roman power, by which he had repeatedly been delivered from the fanaticism of his countrymen, would appear to be the hindrance by which Jewish enmity was held in check, till the time appointed for its complete manifestation (2 Thess. ii. 7, 8). The idea of a false Christ was also blended with that of a spiritual antichrist (see 4 below). Whether as the hero of the Jewish revolution, or as false teachers, the 'Man of Sin' was a mere human representative of Satan, the instigator of all wickedness (2 Thess. ii. 9; cf. 2 Cor. vi. 14, 15).

(3) In the third stage, which is represented in the Apocalypse, antichrist is identified with heathenism. Till the time of Nero, the Christians had never come into direct collision with the Roman power; but by them, as well as by Jews, the Roman empire was now regarded as the fourth kingdom of Daniel's vision (ii.). Caligula, by ordering his image to be set up in the Holy of Holies, had repeated 'the abomination of desolation' (Matt. xxiv. 15; Dan. xii. 11), and proved himself the antitype of Antiochus. And when Nero, after the burning of Rome, made a scapegoat of the Christians, so that they were subjected to all the tortures that a fiendish ingenuity could devise, it was only natural that this monster of cruelty and vice should appear to them the incarnation of wickedness, the antichrist, a wild beast out of the bottomless pit (Rev. xi. 7, xii. 3, xiii. 1-6). The popular belief that Nero would reappear from the East after his death, whether expressed in Rev. xvii. 8 or not, was probably due to the supposed parallel between Christ and antichrist; the return of the one required the return of the other. The names to which the number of the Beast (666, Rev. xiii. 18) has been found to apply, from the end of the 1st century to the present day, are innumerable (see Schaff's *History of the Christian Church*). That of Nero has always been in the list, but it is quite a recent discovery, made by several scholars independently and almost universally accepted, that his name answers to it exactly in Hebrew characters; although even thus the necessary application to Nero is disputed in one of the latest and best orthodox interpretations of the Apocalypse (Milligan, *Baird Lecture*, 1886). See APOCALYPTIC NUMBER. In recent times Mohammed, the Grand Turk, Napoleon I., and Napoleon III., have all been identified with antichrist.

(4) A fourth phase of the New Testament conception of antichrist appears in the Epistles of St John, in which the name first occurs (1 John, ii. 18). Antichrist was a spirit animating certain teachers within the church itself. Indeed, just as in the general aspect of the Pauline conception, the real antichrist is Satan, whose representatives the false teachers are; it is they who are the teachers of error, the ministers of the god of this world; the conflict is between truth and error, light and darkness, Christ and Belial (1 John, ii. 19, iv. 1-6). Many of the Reformers treated the pope as antichrist; and in the Schmalkald articles, the identification, long held to by many Protestants in all lands, became a part of Lutheran doctrine. See Davidson's *Introduction to the New Testament* (1868); Renan's *L'Antichrist* (1873); Philipp's *Die Kirchliche und Biblische Lehre vom Antichrist* (1877); Farrar's *Early Days of Christianity* (1884).

Anticlimax, as opposed to Climax (q.v.), is the addition to a statement of a particular which, instead of heightening the effect, renders the whole ludicrous: nearly equal to Bathos (q.v.). Thus: 'He was eminently truthful in all things. I do not believe he would have told a falsehood, even on his oath' (Hodgson's *Errors in the Use of English*, p. 217).

Anticline (Gr. *anti*, 'against,' *kline*, 'I bend'), in Geology, applied to strata which are inclined in opposite directions from a common axis—that is, in a roof-like form. *Saddleback* is another term used for the same structure. *Syncline* (Gr. *syn*, 'together,' and *kline*) is the converse of anticline, and is applied to strata which are inclined in

a, Anticline; s, Syncline.

opposite directions towards a common axis. Anticlinal and synclinal structures have resulted from the lateral compression and consequent folding of formerly horizontal or approximately horizontal strata. See under GEOLOGY.

Anti-corn-law League. See CORN-LAWS.

Anticosti, an island in the Gulf of St Lawrence, which it divides into two channels, with lighthouses at different parts of the coast, and about 140 miles long, and 30 miles broad in the centre. The hills in the interior rise to about 600 feet. Anticosti has two good havens, one at Ellice Bay, near the western end, and the other at Fox Bay, in the NW. The climate is severe; while the surface is an alternation of rocks and swamps. It is visited by fishermen in the summer, but there are hardly any inhabitants save lighthouse-keepers and a few officials. The island, which is attached to the Canadian province of Quebec, has considerable salmon, trout, cod, and herring fisheries, and is a resort for seal and bear hunting. Extensive peat deposits are found in Anticosti. Marl also occurs. In 1882 Anticosti was in the market for sale, and in 1886 attempts were made by an English company at its colonisation and settlement.

Anticyra, (1) the modern Aspraspitia, an ancient Greek town in Phocis, built on a peninsula in a bay on the Corinthian Gulf. In its neighbourhood grew the best hellebore, a sovereign remedy with the ancients for madness, hence the well-known proverb, *Naviget Anticyram* ('Let him sail to Anticyra'), spoken of a person when he acted senselessly.—(2) A town of Thessaly, on the Sinus Maliacus, also noted for its hellebore.—(3) A town of Locris, at the entrance of the Corinthian Gulf, often confounded with the Anticyra in Phocis. Horace (*Ars Poetica*, 300) speaks as if all three places produced hellebore, *Tribus Anticyris caput insanabile* ('a head not to be cured by the three Anticyras').

Antidote (Gr., 'given against'), a counterpoison. See POISONS.

Antietam, a narrow but deep river in Maryland, United States, falling into the Potomac 7 miles above Harper's Ferry. On its banks, near Sharpsburg, was fought a bloody battle between the Union troops under M'Clellan, and the Confederate army under Lee, in which the former remained master of the field, though at a loss of nearly 13,000 men.

Antifebrin, or ACETANILID, introduced in 1886 as a febrifuge, the cheapness of which, combined with its rapidity of action and its non-poisonous nature, have brought it rapidly into favour as a substitute for quinine. A white colourless powder, with burning taste, it is almost insoluble in cold water, though readily soluble in alcohol. It is derived from anilin, to which

it is closely allied, its chemical formula being $C_6H_5NHC_2H_5O$.

Antigone, daughter of Œdipus by his own mother Jocasta, and sister of Eteocles, Polynices, and Ismene. She accompanied her father in his exile to Colonos in Attica, and after his death, returned to Thebes. When her brothers, Eteocles and Polynices, had both fallen in single combat, and Creon had forbidden on pain of death the burial of the latter, Antigone alone dared disobey. She covered her brother's body with earth, and was in consequence shut up in a subterranean cave, where she perished. Her lover, Hæmon, son of Creon, destroyed himself beside her corpse. Antigone, as the ideal of feminine duty and filial devotion, has been immortalised by Sophocles in his noble tragedies, *Œdipus at Colonos* and *Antigone*. *Æschylus's* tragedy upon her story is lost, but she figures in his *Seven against Thebes*, and in the *Phanissæ* of Euripides.

Antigonus, surnamed the 'One-eyed' (*Cyclops*), one of the generals of Alexander the Great, received in the division of the empire, after the death of the latter, the provinces of Phrygia Major, Lycia, and Pamphylia. After the death of the regent Antipater in 319, he aspired to the sovereignty of Asia, and waged incessant wars against the other generals, making himself master of all Asia Minor and Syria. In 306 he assumed the title of king, but was defeated by Lysimachus, Cassander, and Seleucus in the decisive battle of Ipsus, in Phrygia, in which he was slain, 301 B.C. He was the father of Demetrius Poliorcetes.—**ANTIGONUS GONATAS**, son of Demetrius Poliorcetes, king of Macedonia, and grandson of the great Antigonus. He did not mount his throne until 276, about seven years after his father's death. Driven out of his kingdom in 273 by Pyrrhus of Epirus, he recovered it in the following year, and kept it until his death in 239.

Antigua, a West India island, the most important of the Leeward Islands, and the residence of the governor-in-chief of the British portion of the group. It is 28 miles long and 14 wide; in Boggies Hill attains a maximum altitude of 1328 feet; and has an area of 108 sq. m. Antigua was discovered in 1493 by Columbus, who is said to have named it after a church in Seville, called Santa Maria La Antigua. It was first settled by a few English in 1632, having till then remained, in fact, uninhabited on account of the great scarcity of fresh water. A number of colonists were sent here by Lord Willoughby, to whom Antigua was granted by Charles II. in 1663. For a time occupied by the French, it was declared a British possession by the Treaty of Breda (1667). The constitution consists of a governor, executive council, and a legislative council of twenty-four members, twelve of whom are elected. Antigua is the seat of an Anglican bishop. It has suffered severely from earthquakes—in 1689, 1843, and 1874; while of hurricanes also, the other heavy scourge of the group, Antigua has had its full share. Numerous islets, rocks, and shoals border the shore, so that, generally speaking, access is difficult and dangerous. But St John, the chief town, stands at the head of a safe and capacious bay, which unfortunately, however, does not admit large vessels; and English Harbour is, on the whole, a more commodious port.

Antigua produces large quantities of sugar, molasses, rum, tamarinds, arrowroot, and cotton. The value of imports ranged during 1876-85, between £183,795 and £133,502; of exports, between £270,845 and £136,393. The revenue of Antigua, in 1884, was £41,957; the expenditure, £39,330. Pop. (1861) 36,412; (1881) 34,964, of

whom 1795 were whites. Pop. of St John, the capital, 18,700.

Anti-Lebanon (better Anti-Libanus), the eastern range of Lebanon (q.v.).

Antilegom'ena (Gr., 'spoken against'), a term applied to those books of the New Testament not at first accepted by the whole Christian Church, but ultimately admitted into the Canon—the seven books of 2 Peter, James, Jude, Hebrews, 2 and 3 John, and the Apocalypse. The other books were called *homologoumena* (Gr., 'agreed to'). See BIBLE.

Antilles, a term applied to the whole of the West India Islands (q.v.) except the Bahamas. A hypothetical island, Antiglia, had figured in old sea-charts as early at least as 1424; and that name was applied in 1493 by Peter Martyr d'Anghiera to the West Indies. The Greater Antilles are Cuba, Jamaica, Hayti, and Porto Rico; the others are known as the Lesser Antilles.

Antimony—symb. Sb (Lat. *stibium*); equiv. 122—is a brittle metal of a flaky, crystalline texture, and a bluish-white colour. It is readily reduced to powder by ordinary pulverisation; when heated to 842° F. (450° C.), it fuses, and thereafter being allowed to cool, it solidifies in rhombohedral crystals, which are isomorphous with those of arsenic. Heated in a retort, where the oxygen of the air is excluded, as in an atmosphere of hydrogen, antimony volatilises as the vapour of the pure metal. When raised in temperature in contact with the air, it burns with a white light—combining with the oxygen of the atmosphere, and forming copious white fumes of the sesquioxide of antimony, or 'flowers of antimony.' The metal is a bad conductor of heat and electricity, but may be used, in conjunction with bismuth, in the construction of thermo-electric piles. Exposed to the air at ordinary temperatures, antimony does not tarnish or rust; and this property, combined with the hardness of the metal and of its compounds, renders antimony of essential service in the useful arts, in the construction of alloys, such as Britannia metal, type metal, pewter, and white or anti-friction metal. Precipitated powder of antimony, called *antimony black*, is used for giving an iron-like appearance to casts.

Stibnite, or gray antimony ore, the impure sesquisulphide of antimony, Sb_2S_3 , is the principal source of the metal. This substance has long been employed in the East for darkening the eyebrows. Native antimony is found, but rather sparingly, associated with a few other metals. Antimony is smelted in France, where ore is found abundantly, in Germany, and in England, which receives its supply of ore from Singapore and Borneo. But stibnite has formerly been mined at several places in Great Britain. Although the extraction of antimony from its ore is a simple matter, there are several processes employed. Sometimes 'crude antimony,' or purified sulphide of antimony, is produced by lixiviation as a first stage in the operation. From this there are two or three ways of obtaining the impure metal, called 'regulus of antimony.' This raw antimony, whether obtained from the purified sulphide or direct from the ore, requires a calcination to separate such impurities as arsenic, iron, lead, copper, and sulphur. In the English process of getting it direct, the ore is smelted along with some alkaline slag and old scrap-iron in crucibles. When the mixture is completely fused, it is poured into conical moulds, and the contents of these, after cooling, consist of impure antimony and a slag of sulphide of iron. There are several methods in use for purifying the raw antimony (regulus). One of the simplest is to charge each of a number of crucibles with this regulus along with

some soda, common salt, and pure oxidised antimonial ore. When heat is applied, the foreign metals become oxidised and scorified, and nearly pure antimony or star metal is obtained.

The compounds of antimony are numerous: with oxygen it forms (1) the *sesquioxide* of antimony, or *white antimony ore*, Sb_2O_3 , which enters into the composition of tartar emetic; (2) *antimonious acid*, Sb_2O_3 , which forms one of the components of Dr James's powders; (3) *antimonic acid*, Sb_2O_5 , a very insoluble compound, obtained by acting upon the metal with concentrated nitric acid. With sulphur, antimony forms the *subsulphide*, Sb_2S_3 , already referred to as a natural ore of the metal, and which when roasted at a temperature sufficient to fuse it, passes into the mixed sesquioxide and subsulphide of antimony known commercially as the *glass of antimony*, used for colouring glass and porcelain yellow. A native oxysulphide, of a pretty red colour, is called *red antimony ore*. When the ordinary sulphide of antimony is boiled with potash, or the carbonate of potash, it dissolves; and thereafter, on boiling, deposits a reddish-brown substance, known as *mineral kermes*. The liquid from which the deposit has fallen, if treated with hydrochloric acid, throws down an orange precipitate of *golden sulphide* of antimony.

There is also a chloride of antimony, SbCl_3 , prepared by heating sulphide of antimony and hydrochloric acid together, and which has the common name of *butter of antimony*. It is generally obtained as an oily liquid, of the consistence of melted butter, and of a golden-yellow colour. Mixed with olive oil, it is used by gunmakers as *bronzing salt*, to impart a yellow colour to gun-barrels.

Various compounds of antimony are used as medicinal agents, both in human and veterinary practice, especially the *tartar emetic*, a double tartrate of antimony and potash, $(\text{KSbOT})_2\text{H}_2\text{O}$, which is the active ingredient in antimonial wine, sherry constituting the bulk of the compound. Several cases have occurred where tartar emetic has been used criminally as a poison.

Basil Valentine, in his *Triumphant Chariot of Antimony*, says, 'the shortness of life makes it impossible for one man thoroughly to learn antimony, in which every day something of new is discovered.'

Antino'mianism (Gr. *anti*, 'against,' and *nomos*, 'law'), the doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by advocates of the doctrine of justification by faith, as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi. and 2 Pet. ii. 18, 19, it would seem that a tendency to antinomianism had manifested itself even in the apostolic age; and many of the Gnostic sects were really antinomian, as were probably also some of the heretical sects of the middle ages; but the term was first used at the time of the Reformation, when it was applied by Luther to the opinions advocated by John Agricola (q.v.). Agricola had adopted the principles of the Reformation; but in 1527 he found fault with Melancthon for recommending the use of the law, and particularly of the ten commandments, in order to produce conviction and repentance, which he deemed inconsistent with the gospel. Ten years after, he maintained in a disputation at Wittenberg, that as men are justified simply by the gospel, the law is in no way necessary for justification or for sanctification. The 'Antinomian Controversy' of this time, in which Luther took a very active part, terminated in 1540 in a retraction by Agricola; but views more extreme than his were afterwards advocated by some of the English sectaries of the period of

the Commonwealth; and without being formally professed by a distinct sect, antinomianism has been from time to time reproduced with various modifications. It ought, however, to be borne in mind that the term has no reference to the *conduct*, but only to the *opinions* of men; so that men who practically disregard and violate the known law of God, are not therefore antinomians; and it is certain enough that men really holding opinions more or less antinomian, have in many cases been men of moral life. It is also to be observed that the term has been applied to opinions differing very much from each other. In its most extreme sense, it denotes the rejection of the moral law as no longer binding upon Christians; and a power or privilege is asserted for the saints to do what they please without prejudice to their sanctity; it being maintained that to them nothing is sinful; and this is represented as the perfection of Christian liberty. But besides this extreme antinomianism, than which nothing can be more repugnant to Christianity, there is also sometimes designated by this term the opinion of those who refuse to seek or to see in the Bible any positive laws binding upon Christians, and regard them as left to the guidance of gospel principles and the constraint of Christian love. Antinomianism usually originates in mistaken notions of Christian liberty, or in confusion of views as to the relation between the moral law and the Jewish law of ceremonial ordinances.

Antin'ous, a youth of extraordinary beauty, a native of Claudiopolis, in Bithynia, the favourite of the Emperor Hadrian, and his companion in all his journeys. He was drowned in the river Nile, near Besa, in 122 A.D., perhaps through suicide, either from weariness of the life he led, or from a superstitious belief that his voluntary death would avert disaster from the emperor. The emperor's grief knew no bounds—he enrolled him among the gods; built in his honour Antinopolis on the ruins of Besa, as well as numerous temples in Bithynia, Arcadia, and elsewhere. Antinous became, on Hadrian's account, a favourite subject for art, and many statues, busts, gems, and medals exist, representing him as the ideal of youthful manly beauty, often also with the added attributes of deity. Some of these rank among the masterpieces of Roman art, especially the colossal statue in the Vatican representing the youth as Dionysus, with ivy crown and hanging locks; the statue in the Capitoline Museum; and the marble bust in relief in the Villa Albani. Antinous's relations with Hadrian form the subject of the well-known romances, *Antinous*, by George Taylor, and *Der Kaiser*, by Ebers. See Dietrichson's *Antinous* (Christiania, 1886).

Ant'ioch, the ancient capital of the Greek kings of Syria, and long the chief city in Asia, lies in a fertile and beautiful plain, on the left bank of the river Orontes, 14 miles from the sea. In ancient times by its navigable river and its harbour, Seleucia, it had communication with all the maritime cities of the West; while it became on the other hand an emporium for the merchandise of the East, for behind it lay the vast Syrian desert, across which travelled the caravans from Mesopotamia and Arabia. Thus through it passed the high-road between Europe and Asia. It received from Strabo the name of *Tetrapolis* ('four cities'), on account of three new sites having been built upon successively, and each surrounded with a wall. The city was erected by Seleucus Nicator about 300 B.C., and was the most splendid of the sixteen cities built by him in honour of his father Antiochus. In early times a part stood upon an island which has now disappeared. The rest was built partly on the

plain, and partly on the rugged ascent towards Mount Casius (*Jebel Okrah*), amid vineyards and fruit-trees. The ancients called it 'Antioch the Beautiful,' and 'the Crown of the East.' It was a favourite residence of the Seleucid princes, and of the wealthy Romans, and was famed throughout the world for its splendid luxury. Its public edifices were magnificent. The city reached its greatest glory in the time of Antiochus the Great, and under the Roman emperors of the first three centuries. At that time it contained 500,000 inhabitants, and vied in splendour with Rome itself. Nor did its glory fade immediately after the founding of Constantinople; for though it then ceased to be the first city of the East, it rose into new dignity as a Christian city. It was one of the earliest strongholds of the new faith—indeed, it was here that the name of *Christians* was first used. During the apostolic age it was the centre of missionary enterprise, and it became the seat of one of the four patriarchs. Ten councils were held here from 252 to 380. Churches sprang up exhibiting a new style of architecture which soon became prevalent; and even Constantine himself spent a considerable time here, adorning it, and strengthening its harbour, Seleucia. The downfall of the city dates from the 5th century. In 538 it was reduced to ashes by the Persian king Chosroes, but it was partly rebuilt by Justinian. The next important event in its history was its conquest by the Saracens in the 7th century. In the 9th century it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The Crusaders besieged and took it in 1098. At the close of the 13th century, the sultan of Egypt seized it. At present it forms a portion of Syria, in the province of Aleppo, and has a population of 17,500, mostly Turks employed in silk-culture, eel-fishing, and in the production of corn and oil. Its modern name is *Antakieh*. It exhibits almost no traces of its former grandeur, except the ruins of the walls built by Justinian, and of the fortress erected by the Crusaders. It suffered from an earthquake in 1872.—**ANTIOCH**, in Pisidia, founded also by Nicator, was declared a free city by the Romans in the 2d century B.C., and made a *colonia* under Augustus, with the name *Cæsarea*. It was often visited by St Paul.

Antiochus, the name of thirteen kings of Syria of the Seleucid dynasty. **ANTIOCHUS I.**, surnamed Soter (reigned 281–261 B.C.), the first of the Syrian dynasty of the Seleucids, was the son of Seleucus, one of the generals and successors of Alexander. The murder of his father in 281 gave him the whole Syrian empire, but left him too weak to assert his right to Macedonia. Antiochus gained the name of Soter ('Saviour') for a victory over the Gauls, but fell in a subsequent battle with them in 261.—**ANTIOCHUS II.** (261–246), surnamed Theos ('God') by the Milesians, whom he freed from their tyrant Timarchus. On the death of Ptolemy, whose daughter Berenice he had been compelled to marry, Antiochus recalled his former wife Laodice; but she, in revenge for the insult which she had received, caused Antiochus to be murdered, along with Berenice and her son. Antiochus lost the provinces of Parthia and Bactria.—**ANTIOCHUS III.**, surnamed the Great, the son and successor of Seleucus Callinicus, and grandson of the preceding, was the most distinguished of the Seleucids. He reigned from 223 to 187. He failed in his attempts to recover Parthia and Bactria, and waged war with success against Ptolemy Philopater, and though defeated in a great battle fought at Raphia near Gaza (217), he afterwards obtained entire possession of Palestine and Coele-Syria (198). In

this war he was assisted by the Jews, to whom he granted many privileges. Fearing the power of the Romans, Antiochus at length concluded a peace with Egypt, betrothed his daughter Cleopatra to the young king Ptolemy, and gave her Coele-Syria and Palestine as a dowry. He afterwards became involved in war with the Romans, who had conquered Macedonia; but he declined to invade Italy at the instigation of Hannibal, who had come to his court for refuge. He crossed over into Greece, but was defeated in 191 at Thermopylæ, and in 190 by Scipio at Magnesia. Peace was granted him only on condition of his yielding all his dominions east of Mount Taurus, and paying a heavy tribute. In order to raise the money, he attacked a wealthy temple in Elymais, when the people rose against him, and killed him (187 B.C.).—**ANTIOCHUS IV.** (175–164 B.C.), surnamed Epiphanes, fought against Egypt and conquered great part of it. He twice took Jerusalem; and, endeavouring there to establish the worship of Greek gods, he by his tyranny and sacrilege excited the Jews to a successful insurrection under their leaders Mattathias and his heroic sons, the Maccabees.—The last of the Seleucids, **ANTIOCHUS XIII.**, surnamed Asiaticus, was deprived of his kingdom by Pompey, who reduced Syria to a Roman province (65 B.C.).

Antipædobaptist is a term derived from Greek words for one who objects to infant-baptism. See **BAPTISTS**.

Antip'aros (anc. *Oliaros*), one of the middle Cyclades in the Ægean Sea, close to Paros. It is well cultivated and tolerably fertile, nearly 14 sq. m. in area, and contains about 500 inhabitants. Rich lead mines were discovered in 1872. Its wonderful stalactite grotto is not alluded to by any Greek or Roman writer, but has been well known since 1673. The entrance forms a wide natural portico on the south-west side of a mountain, from which the visitor reaches the first spacious vault by means of ropes and ladders. To go farther is still more difficult. At a depth of 918 feet under the entrance, the chief chamber is reached. It is 312 feet long, 98 wide, and 82 high, and is covered everywhere with the most wonderful stalactite and stalagmite formations.

Antip'ater, (1) a general highly trusted by Philip and Alexander the Great, left by the latter as regent in Macedonia when he crossed over into Asia, 334 B.C. He discharged the duties of this office with great ability, suppressing the insurrections in Thrace and Sparta; but he was about to be superseded by Craterus, through the influence of Olympias, when Alexander died. The government of Macedonia was assigned to him anew, in conjunction with Craterus; and soon after, he was called upon to defend himself against an alliance of the Grecian states. The war, usually called the Lamian war, from Lania where Antipater was besieged in 323, was terminated by the defeat of the confederates in 322. The murder of his unsuccessful rival, Perdiccas, in Egypt in 321 B.C., left Antipater the supreme regency of the kingdom, and the guardianship of Alexander's children. He died at an advanced age in 319.—(2) The father of Herod the Great, appointed by Julius Cæsar procurator of Judæa in 47 B.C. He was poisoned in 43 B.C.—(3) The son of Herod the Great by his first wife, a worthless prince, who was perpetually conspiring against the life of his brothers, but was executed in prison five days before Herod died.

Antip'athy is the term applied to a class of cases in which individuals are disagreeably affected by, or violently dislike, things innocuous or agreeable to the majority of mankind. These peculiarities are sometimes innate—James I.'s, for instance,

to a drawn sword; sometimes they are due to a child's having been injudiciously terrified with some object, the mental impression becoming permanent. In many cases, antipathy arises from mental association, often unconscious, of one object or impression with some other admittedly unpleasant, or with some painful experience in the past life of the person affected. A large class of persons have an antipathy to animal food, and from childhood refuse to taste it. In others, again, the aversion is limited to one kind of meat, as veal or pork; others are averse to eggs or milk. Nor is this feeling a conscious caprice, which an exertion of the will might remove; for it is generally found that contact with the object of the antipathy is resented by the bodily economy, and symptoms of poisoning are rapidly produced. Some are affected with these symptoms who have no mental aversion to the article. Some medicines affect particular persons dangerously, even when given in very minute doses; on others, medicines have a peculiar effect—astringents may purge. The air of some places has a peculiar influence on individuals.

The most remarkable antipathies are those affecting the special senses. Nearly all persons have a loathing at reptiles, but some few *faint on seeing* a toad or lizard, others on seeing insects. Tycho Brahé fainted at sight of a fox, Henry III. of France at that of a cat, and Marshal d'Albert at a pig. *Hearing* a wet finger drawn on glass, the grinding of knives, or a creaking wheel, is sufficient to produce fainting in some. *Smelling* musk or ambergris throws some into convulsions; and we have seen how articles of food affect others—often, no doubt, owing to perverted taste. The *touch* of anything unusually smooth has the same effect sometimes. Zimmerman records the case of a lady who was thus affected by the feeling of silk, satin, or the velvety skin of a peach.—This subject is also noticed under IDIOSYNCRASY.

Antiperiodics are drugs which relieve or cure certain diseases (particularly ague, and some forms of neuralgia and headache) whose attacks occur at regular intervals. The most important are cinchona bark and its alkaloids, especially quinine, and arsenic.

Antiphlogistic (Gr. *anti*, 'against,' and *phlogizo*, 'I burn'), a term applied to remedies and to regimen opposed to inflammation, such as blood-letting, purgatives, low diet, &c.

Antiphon, the earliest of the ten Attic orators in the Alexandrine canon, born at Rhamnus in Attica, 490 B.C. He belonged to the oligarchical party at Athens, and to him, according to his pupil Thucydides, was mainly due the establishment of the government of the Four Hundred in 411 B.C. On its fall, six months later, Antiphon was brought to trial and condemned to death, in spite of his noble defence. Only fifteen of his orations have come down to us, of which three were written for others, while the remainder appear to have been intended as specimens of school-rhetoric for his pupils. The best edition is by Blass (Leip. 1881).

Antiphony, the name of a species of sacred song, sung by two parties, each responding to the other. Many of the Psalms show that antiphonal singing was in use in David's time. Its introduction into the Greek Church is ascribed to Ignatius, Bishop of Antioch, in the 2d century; and Ambrosius, Bishop of Milan, is said to have introduced it into the Western Church, in the 4th century. The chanting of the Psalms in the English cathedral service is an imitation of the ancient antiphony.

Antipodes, a word of Greek origin, signifying, literally, those who have their feet over against

each other. Thus Trevisa, in 1398, says that 'in Ethiopia are the Antipodes, men that have their feet against our feet.' As applied in geography, the term means the inhabitants of any two opposite points of the globe, or, in other words, the dwellers at the opposite extremities of any diameter of the earth. From this primary relation there necessarily arise many secondary relations. Antipodes must be on one and the same meridional circle, separated from each other by half the circumference. Being on one and the same meridional circle, they must differ in longitude exactly 180°, with the exception of the poles themselves, as having no longitude at all; and being separated from each other by half the circumference, they must be equidistant from the equator in opposite directions. Take, as an example, London, in 51° 30' N. lat., and 0° 5' W. long. Its antipodes must be in 51° 30' S. lat., and in 180° 5' W. long., or rather 179° 55' E.—coinciding pretty nearly with Antipodes Island (49° 48' S.; 178° 20' E.), an uninhabited rocky islet, about 5 miles long, with smaller rocks around it, lying to the south-east of New Zealand.

Between antipodes in general there necessarily exist also other secondary relations. With reference to the earth's daily rotation, the noon of the one side must be the midnight of the other; while, with regard to its annual revolution, the summer and the autumn of the one side must be the winter and the spring of the other. The midnight corresponds to the noon on the other side, either of the day before or the day after, according as one has reached the antipodes sailing from the east or from the west. In going eastward—that is, in meeting the sun—one, from day to day, anticipates every noon and every midnight in the proportion of 4' of time to 1° of long., or of 12 hours of time to 180° of long. In going westward, again, one postpones every noon and every midnight in the same proportion.

Antipope, a pontiff elected in opposition to one canonically chosen. The first antipopes were Felix, during the pontificate of Liberius (352-366); Ursinus, against Damasus (366-384); and Laurentius, against Symmachus (498-514). During the middle ages several emperors of Germany set up popes against those whom the Romans had elected without consulting them. Otho the Great displaced successively two Bishops of Rome; and when the rival pope, Sylvester III., had expelled the simoniacal and prodigal Benedict IX. (1033-45), the latter was brought back by the German king, and soon afterwards sold his dignity to Gregory VI. There were now, consequently, three popes, but their claims were all set aside at a council convened at Sutri by the emperor, Henry III., and a new pope elected as Clement II. in 1046. Shortly after, Pope Alexander II. found a rival in Honorius II., the nominee of the emperor; but his claim was ratified by a council convened at Mantua. In 1080 the same unseemly spectacle was witnessed, when the emperor, Henry IV., elevated to the papal chair Guibert of Ravenna, under the title of Clement III., in opposition to his own implacable adversary, Gregory VII. But after the death of Gregory (1085), Clement was himself opposed successively by Victor III. (1086-88) and Urban II. (1088-99). Innocent II. (1130-43) triumphed over the antipope Anacletus II. by the help of St Bernard; and Alexander III. during his pontificate (1159-81) had to contend with no fewer than four successive antipopes, the election of only one of whom, however, Victor V., in 1159, has any canonical validity. After a long contest, Clement V. was elected in 1305, and four years later he transferred his seat to Avignon, where his successors reigned for nearly seventy years, losing the while,

by their subjection to French influences, the sympathies of Germany and England. The election of Urban VI. in 1378 occasioned 'the great schism of the West,' which divided the church for fifty years. He was elected by the Romans, who demanded an Italian pope after the death of Gregory XI. The French cardinals, then a majority in the curia, on the plea that they had elected the pope only under intimidation, withdrew to Provence, and elected a new pope under the name of Clement VII., who was recognised by France, Spain, Savoy, and Scotland; whilst Italy, Germany, England, and the whole north of Europe, supported Urban VI. For thirty-eight years Christian Europe was scandalised by the spectacle of two popes, one at Geneva, another at Rome, in turn hurling the most awful anathemas of the church at each other, like 'two dogs snarling over a bone,' in Wyclif's phrase. At the beginning of the 15th century, an attempt was made to prevail on both the rivals, Gregory XII. at Rome, and Benedict XIII. at Avignon, to renounce their claims with a view to promote union, but both evaded this as long as possible. At length, however, the cardinals attached to either court agreed to summon a general council, which met accordingly at Pisa in 1409. The council deposed both popes, and constituted the separate bodies of cardinals into one conclave, which elected Alexander V. to the papal chair. The council of Basel (1431-47), in its struggle with Pope Eugenius IV. (1431-47) for supremacy, attempted to arrogate to itself the papal functions, and proceeded to elect Amadeus of Savoy pope, as Felix V. The attempt, however, failed; the popes Eugenius IV. and Nicholas V. (1447-55) secured their authority, the ambitious council finally dissolved itself, and Felix V. resigned his empty dignity, and was raised to the rank of cardinal by the magnanimous pope himself. This was the last occasion on which the faithful were distracted by the sight of a rival pontiff within Christendom. See POPE.

Antipyrin is one of the most serious rivals to quinine yet artificially produced. It is obtained from coal-tar products by a process of great complexity, its chemical composition being $C_{11}H_{12}N_2O$. It is a white crystalline powder, tasteless, colourless, and soluble in water. Given in doses of 15 to 30 grains, it reduces the temperature 2° to 3° in about an hour, without the discomfort of profuse perspiration, and is therefore of great value as a febrifuge. It is not an antiperiodic, however, and therefore cannot replace quinine in cases of ague or intermittent fevers.

Antiquaries, SOCIETY OF. See ARCHÆOLOGY, ACADEMY.

Antique. As the term ancients is commonly applied to the Greeks and Romans, the word antique is used with reference to their works of art, especially their incomparable sculptures. See SCULPTURE.

Antiquities. See ARCHÆOLOGY.

Anti-rentism, a term applied to the action of a political party which caused considerable disturbance in the state of New York (1843-47) in connection with the non-payment of rent. Large tracts of land had been granted in old colonial days by the Dutch West India Company to its members in New York, who had the title or privilege of a lord 'patroon' or protector, and the colony or manor was governed by feudal tenures. Though the latter were abolished by laws enacted in 1779 and 1785, yet the proprietors managed to form a deed by which rents and dues should be paid as formerly. Associations were formed in 1839 to get rid of these burdens; evictions were tried by the proprietors, which led to resistance and outrages. Ultimately the legislature gave relief of a certain

kind to the tenantry, feudal tenures and incidents were abolished, and agricultural land was forbidden to be leased for a longer period than twelve years.

Antirrhinum. See SNAPDRAGON.

Antisana, a volcano of the Andes, in Ecuador, about 35 miles SE. of the town of Quito, 19,260 feet high. On its slopes are many extinct craters, and at a height of 12,400 feet, the famous Tambo de Antisana, one of the highest inhabited places in the world.

Antiscorbutics. See SCURVY.

Antisemites, the modern opponents of the Jews in Russia, Roumania, Hungary, and Eastern Germany. In these countries the Jews are found in great numbers, and their constantly increasing wealth and influence excite popular jealousy and alarm. The question how far it is advantageous for a country to allow excessive wealth and political power to pass into the hands of a race avowedly alien, and but little influenced by the sentiment of nationality, admits of discussion, but there can be no excuse for the brutal outrages upon innocent individuals that occurred in Russia and Hungary in the years 1881-84. Even in the enlightened capital of the German empire the *Judenhetze* raged hotly; and an Anti-Semitic League was formed in 1881 to restrict the liberty of Jews in Germany. The emperor interfered to stop the cowardly persecution, but not before thousands of Jews had left the country. The persecution in Russia assumed a more brutal character than in Germany, and thousands of Jews fled to America, Spain, and elsewhere to save not alone their liberties and their property, but their lives. In Hungary violent anti-Jewish riots occurred at Pesth, Zala, and elsewhere, which were not brought to an end until martial law was proclaimed. See JEWS.

Antiseptics (Gr. *anti*, 'against,' *septikos*, 'causing putrefaction') are substances which prevent or arrest putrefaction and analogous fermentative changes. It has been proved that Putrefaction (q.v.), fermentation of grape-juice (*vinous fermentation*), of milk (*lactic fermentation*), and many, though probably not all other fermentations, depend upon the presence of microscopic vegetable organisms (see GERM THEORY). To prevent these processes, then, it is necessary either (1) to exclude these organisms altogether; (2) to interfere with conditions which permit of their development; or (3) to destroy their vitality.

(1) These organisms, or their germs, are present in ordinary air; but it has been shown by Pasteur, Tyndall, Lister, Roberts, and others, that if air be filtered through cotton wool, or (if moving slowly) through a fine bent tube, it may be allowed to come in contact with putrescible substances, if these themselves contain no living organisms or germs, without causing putrefaction. This method, however, has had no important applications except in scientific research.

(2) Their growth may be arrested (*a*) by a low temperature. Thus large quantities of fresh meat are imported from America, and even Australia and New Zealand, in chambers cooled to near the freezing-point. Carcasses of the long-extinct mammoth, with the flesh still present, have been found in the ice-cliffs of Siberia. The longer time that meat, milk, &c. keep in cold than in hot weather is familiar. (*b*) By absence of moisture. Thus, if the contents of an egg be thrown out on a plate, and thoroughly dried in an oven, the whole becomes of a hard, horny consistence, and may be kept in this state for years. If soaked in water, it will soon begin to putrefy. In the same way meat may be kept fresh by thoroughly drying it. (The preservation of fruits, &c. in strong syrup is an example of a somewhat similar action.)

(3) The vitality of these organisms may be destroyed (a) by heat—e.g. meat and other eatables can be preserved for an indefinite time if they are boiled and hermetically sealed, while still hot, in tin vessels (see PRESERVES); (b) by various chemical substances. Some of the most important are common salt and saltpetre, used in curing fish, pickling meat, &c.; alcohol, in preserving zoological specimens, vegetable essences, fruits, &c.; sulphurous acid, boracic acid, and arsenious acid; many salts, as chloride of zinc (Burnett's solution, q.v.), permanganate of potash (Condy's fluid, see under MANGANESE), sulphate of copper (blue vitriol), corrosive sublimate, nitrate of silver; chlorine (given off by chloride of lime), iodine, iodoform (CHI_3), glycerine, boroglyceride, eucalyptus oil, thymol, creasote, carbolic acid, salicylic acid, tannic acid, quinine, the patent preparation 'sanitas,' charcoal (both vegetable and animal), dry mould, used in the earth-closet system (see SEWAGE). All these substances act directly or indirectly as poisons to the organisms which produce putrefaction, &c.; most of them are either poisonous or very unpalatable to man, and cannot therefore be used in preserving food. Many of them are, however, used in the arts to arrest the decomposition of putrescible substances—e.g. in the manufacture of size for writing-paper from scraps of hides, sulphite of soda, containing sulphurous acid, is added; hides are preserved by salt, or, when tanned, by tannin, a compound of tannic acid; and timber is found less liable to decay if charged with an antiseptic, such as sulphate of copper, chloride of zinc, corrosive sublimate, or creasote. The timber is placed in a steam-box, so that the air contained in its pores is displaced by steam; the whole casing is then closed tight, and allowed to cool; the steam condenses and leaves a vacuum in and around the wood. If one of these substances is then introduced, it finds its way into the innermost pores of the timber (see WOOD-PRESERVING).

Several of the above-named antiseptics are largely used in the preservation of food. Salicylic acid is used for preserving beer, butter, fruits, and meat; and to such an extent is this the case, that the French authorities have forbidden the sale of anything containing this preservative, on the ground that when taken continuously, even in small doses, it is injurious to health. The opposite view is held by many in this country, and the question is still *sub judice*. Boracic acid, either alone or mixed with borax or glycerine, is a very powerful preservative, and experience indicates that the amount necessary to preserve food is perfectly harmless. Large quantities of butter (Swedish, &c.) are now sent into this country, which have only sufficient salt added to impart flavour, and which owe their keeping properties to boracic acid. It is also coming into use for preserving fresh fish, and a bright future is opening up to fishermen in secluded waters, who hope thereby to be able to get a wider market for their harvest. Milk and meat are readily kept sweet for some time when treated with this acid.

Next to the preservation of food, the most important purposes for which antiseptic methods and substances are used, are the *prevention of infectious diseases*, and the *treatment of wounds*. The properties of the infectious matter of infectious diseases are closely analogous to those of the organisms that lead to putrefaction, &c.; and even in cases where its organic nature has not been proved (see GERM THEORY), it can be rendered inert by a proper use of antiseptics, or by exposure to a high temperature. Thus, anything that has come near the patient suffering from an infectious disease, and discharges from his person, are made harmless by carbolic acid, chloride of zinc, or

some other antiseptic; his bedding is roasted in an oven at a temperature of 212°F. (100°C.), or more; the room where he has been treated is fumigated with chlorine or sulphurous acid; and so the disease is prevented from spreading. This is, in fact, one of the chief aims of medical practice at the present day (see DISINFECTANTS).

Many of the evil effects which follow wounds and surgical operations are due to the presence of organisms (see PYÆMIA); and the effects of their antiseptic treatment, introduced by Sir Joseph Lister, have been marvellous.

Antiseptic Surgery, or LISTERISM, is the system of treating surgical wounds introduced by Sir Joseph Lister (q.v.), based on his clear recognition of the fact that putrefactive processes (*sepsis*) are the chief danger which the surgeon has to combat in dealing with accidental and operation wounds. The system consists essentially in excluding, by the use of germicide substances, those microbes by which fermentative processes are induced, or in eradicating them from wounds to which they have gained access. In this way pyæmia, septicæmia, erysipelas, and gangrene, once the scourge of surgical hospitals, have in a short period of years become diseases of rare occurrence, and the reduction in hospital mortality has been very great. Carbolic acid dissolved in various menstrua, in the form of a steam spray, or impregnated in gauze or cotton-wool, was till recently the favourite antiseptic in surgical practice. Thymol, eucalyptus oil, boric and salicylic acids, and iodoform, are also in frequent use for the same purposes. In 1881 Professor Koch of Berlin drew attention to the much greater potency of perchloride of mercury (corrosive sublimate) as compared with other antiseptics, and his suggestion of its employment in a one *pro mille* aqueous solution has now been universally adopted with satisfactory results. Along with carbolic acid, which is still preferred for some parts of the method, this antiseptic is employed in destroying the infective particles or *germs* in the immediate neighbourhood of the wound. The wound itself is only treated with the germicide solution when the presence of germs within it is suspected, otherwise it is kept free from the irritative action of the lotion; but all objects approaching it must be rigorously purified if the danger of infection is to be safely avoided.

Method of Operating and of Dressing Operation-wounds.—The skin of the part, the hands of the operator and his assistants, and the instruments, are carefully purified with a watery solution (1 in 1000) of corrosive sublimate. Sponges, Ligatures, and Drainage-tubes (q.v.) are kept in carbolic acid solutions. The operation is conducted in an atmosphere impregnated with carbolic acid by means of a fine spray, usually produced by steam generated in a small boiler, or the wound and its neighbourhood are constantly irrigated by the corrosive sublimate solution during the continuance of the operation. When the operation is completed and the wound closed, it is covered with a layer of specially prepared oil-silk (protective), to prevent constant irritation by the antiseptic in the dressing. This consists of muslin impregnated with a mixture of carbolic acid, resin, and paraffin; it retains the carbolic acid at ordinary temperatures, but gives it off slowly at the temperature of the body, so that the dressing remains in an actively antiseptic condition for some days, till all its carbolic acid has evaporated. The first layer is wetted in carbolic acid solution (1 to 40) to destroy any germs adhering to its surface, and render it actively antiseptic at once. The remainder is applied dry, in order to soak up the discharge as it flows from the wound. This dressing may be in part or wholly replaced by fine cotton wadding impregnated with corrosive

sublimate, or with salicylic acid, its elasticity rendering it a more comfortable application, and permitting its close adaptation to the contour of the body. The whole is fixed by bandages. The dressing is in general not changed till discharge becomes visible through it. When it is changed, similar precautions with regard to spray, purification of hands, &c. must be observed.

Treatment of Wounds not inflicted by the Surgeon.—They are washed out with a searching antiseptic solution, as watery solution of corrosive sublimate (1 in 500) or carbolic acid (1 in 20), and are thus at once thoroughly disinfected. They are then treated like operation-wounds. After 48 hours at furthest, it is not generally possible to eradicate the causes of putrefaction thoroughly.

Results.—If this treatment is thoroughly carried out: (1) no bacteria and no putrid smell are present in the discharge; (2) no pyæmia, septicæmia, hospital gangrene, or erysipelas results; and in general (3) no formation of pus takes place; (4) no pain is felt in the wound; (5) no fever follows.

Some of the most striking effects of this method on surgical practice are: (1) In many cases of injury, especially compound fractures and dislocations, a limb may now be preserved where amputation was formerly considered necessary. (2) Many operations are now fearlessly and safely performed, which formerly were either not attempted, or were frequently followed by disastrous results; especially operations on bones and joints, and opening of Chronic Abscesses, and Serous Membranes (q.v.). (3) Mortality from injuries and operations has been greatly diminished—e.g. the death-rate after major amputations (in 1864 and 1866) fell from 45 per cent. to 15 per cent. (1867-69) in Lister's wards in Glasgow after he introduced his method, and to about 12 per cent. (in 1871-77) in Edinburgh, when he had further developed it. Volkman of Halle was on the point of closing his wards in consequence of the prevalence of pyæmia and septicæmia. He tried Lister's method, and during the next five years the total mortality in his wards was less than 6 per cent. See Cheyne's *Antiseptic Surgery* (1882).

Antispasmodics. See SPASM.

Antisthenes, founder of the Cynic school of philosophy, was the son of an Athenian father and a Thracian mother. He fought in his youth at Tanagra (426 B.C.), was first a disciple of Gorgias, afterwards a friend and follower of Socrates, and died at Athens at the age of 70. After the death of Socrates, he taught moral and practical philosophy in the Athenian gymnasium Cynosarges, from which it is said his school derived its title. Antisthenes held that virtue mainly consists in voluntary abstinence from pleasure, and in a stern contempt of riches, honours, and even learning. He showed his contempt for all the luxuries and comforts of life by eating the hardest fare and wearing ragged garments—an eccentricity which Socrates reproved with the words, 'I see your pride through the holes in your cloak.' Antisthenes attracted many imitators, among them the famous Diogenes, and from his school the Stoics subsequently sprung. His writings have mostly perished.

Antithermin is the popular name applied to a substance derived from coal-tar, and having a very complex chemical composition, introduced by M. Nicot in 1887 as a rival to quinine. As its name indicates, it acts by reducing temperature, and therefore combating inflammation.

Antithesis (Gr. *anti*, 'against,' and *thesis*, from *tithēmi*, 'I place'), an opposition or contrast of ideas expressed by bringing words that are the natural opposites of each other close together so as to produce a strong contrast. Thus

Lessing, in a criticism on a book, says: 'It contains many good things and many new; but the good are not new, and the new are not good.' Antithesis, when naturally and moderately employed, gives liveliness to style; but, like all strong figures of speech, becomes wearisome when too often repeated, as it is in the sonorous prose of Dr Johnson.

Antitrinitarian, one who denies the doctrine of the Trinity. The name is practically synonymous with Unitarian. See UNITARIANS and TRINITY.

Antitype, a Greek word, literally signifying a type or figure which corresponds to some other type or figure. In its theological sense, it denotes, not a type, but the person in whom any prophetic type is fulfilled; thus, Christ is called the antitype of the paschal lamb. See TYPE.

Antium, one of the most ancient cities of Latium, built on a rocky promontory running out into the sea. Being favourably situated for commerce and piracy, it became, under the Volscians, one of the most powerful enemies of rising Rome. Conquered in 468 B.C., it soon revolted, and long maintained its independence, but was at length subdued in 338 B.C. It was deprived of all its ships, the beaks of which (*rostra*) were carried off to ornament the platform of the speakers in the Roman forum. It became a favourite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces; such as the Apollo Belvedere, and the Borghese Gladiator. It was the birthplace of the Emperors Caligula and Nero.

Antivari, a seaport on the coast-district assigned to Montenegro by the Treaty of Berlin in 1878. It was formerly Albanian, and is 18 miles NW. of Scutari. It has a citadel, and a small harbour, shut against war-ships. Considerable trade is carried on in manufactured goods, tanned hides, soap, and petroleum. Pop. 8000.

Antlers, bony outgrowths from the frontal bones of almost all the members of the deer family. Except in the reindeer, they are restricted to the males, and are secondary sexual characters used as weapons in fighting for possession of the females. They appear as a pair of knobs covered with dark skin, from which the bony tissue is developed. In the year after that of birth, the antlers remain unbranched conical 'beams.' In the following spring, the previous growth having been meanwhile shed, the antlers grow to a larger size, and form their first branch or 'brow.' Year by year the number of branches or 'tines' increases, and more than sixty have been counted on some magnificent heads. The soft hairy skin which secures their rapid annual growth is known as the 'velvet,' and its accidental injury affects the development of the antlers. Growth ceases when the blood-supply is cut off by the development of a tubercled burr at the base, and the deer then rub off the dry skin and leave the bone bare. The antlers are shed, in many cases at least, annually, after the breeding period. The various types of antlers are used as convenient characters in distinguishing the different genera. Investigation of fossil forms has shown that the gradual development of antlers exhibited in the individual life of the deer is a recapitulation of their progressive historic evolution. See HORNS, DEER, SEXUAL SELECTION.

Ant-lion, the larva of an insect (*Myrmecleon*) of the order Neuroptera, remarkable for the ingenuity of its insect-catching habits. It inhabits sandy districts, is not known in Britain, and is

more common in the south of Europe than in the north. Some species are common in North America. The perfect insect is about an inch long, and has a general resemblance to a dragon-fly. The grayish-yellow larva is rather more than half an inch long; it has a stout hairy abdomen, and a small head, which is furnished, however, with two very large incurved mandibles. It has six legs, but is incapable of rapid locomotion, and generally jerks itself backwards. It feeds upon the juices of insects, especially ants, in order to obtain which it cleverly excavates a funnel-shaped pitfall in sandy ground, and lies in wait at the bottom, often with all but its mandibles buried in the sand. When insects approach too near to the edge of the hole, the loose sand gives way, so that they fall down the steep slope. If they do not fall quite to the bottom, but begin to scramble up again, the ant-lion throws sand upon them by jerking its head,

Ant-lion, showing perfect insect, larva, and excavation.

and thus brings them back. It employs its head in the same way to eject their bodies from its pit, after their juices have been sucked, and casts them to a considerable distance; and by the same means throws away the sand in excavating its hole, first ploughing it up with its body, and then placing it upon its head by means of one of its fore-legs. It always begins by working round the circumference of its future hole, and gradually narrows and deepens it; turning quite round after each time that it works round the hole, so as to employ next time the fore-leg of the other side. When it meets with a stone which it cannot remove, it deserts the excavation and begins another. The pit is rather more than two inches deep. After about two years the larva spins its cocoon. The habit is seen at a lower stage of evolution in some species which simply bury themselves in the sand without making any pitfall.—The name of Ant-lion (*Myrmekoleon*) was long given to a fabulous beast, supposed to be the offspring of a lion and a female ant, and participating in the form and qualities of both parents.

Antofagasta, a port in the Chilian territory of the same name, of increasing importance. Founded in 1870, the town owes its rapid rise to the saltpetre deposits in the neighbourhood, and to the rich mines of Caracoles, with which it is connected by railway. It was taken from Bolivia by Chili in the war of 1879. Pop. (1875) 5384. See ATACAMA.

Antommarchi, FRANCESCO, the physician of Napoleon at St Helena, was also a native of Corsica, and was born about 1780. He was already an anatomist of some celebrity at Florence, when he was induced in 1818 to go to St Helena. Napoleon received him with mistrust, but ulti-

mately gave him his full confidence, and at his death left him 100,000 francs. After his return to Europe, he published at Paris his famous but scarcely trustworthy book, *Les Derniers Moments de Napoleon* (1823). During the Polish revolution, he did duty at Warsaw as director of military hospitals. He afterwards went to the West Indies, and died in Cuba, on the 3d of April 1838.

Antonelli, GIACOMO, cardinal, was born 2d April 1806, at Sonnino, a village situated near the Pontine Marshes. His father was a woodcutter, member of an ancient but decayed family. In 1819 his birthplace having been demolished as a nest of robbers, Antonelli came to Rome, and entered the Grand Seminary, where he proved himself one of the cleverest students of his time. He gained the favour of Pope Gregory XVI., who named him a *prelato*, and gave him some excellent ecclesiastical appointments. In 1841 Antonelli became under-secretary of state to the ministry of the interior; in 1844, second treasurer; and in the following year, finance minister of the two apostolic chambers. Pope Pius IX., having mounted the papal throne in 1846, raised Antonelli, during the next year, to the dignity of cardinal-deacon of Santa Agatha alla Suburra. In 1848 Antonelli was president and minister of foreign affairs in a liberal cabinet, which framed the famous *Statuto* or Constitution proclaimed in 1848, the principal articles of which were so very soon eluded. He accompanied the pope in his flight to Gaeta, and returned with him to Rome, and supported the reactionary policy. In 1855 an attempt was made upon his life. In the Vatican Council of 1869-70, Antonelli showed great tact and ability. He obstinately resisted all concessions to the growing national spirit of the Italian people; but his protestations against the progress of events in Italy were of no avail, and Victor-Emmanuel entered Rome in 1871. At the date of his death, 6th November 1876, the various posts held by Antonelli made him virtually prime-minister to the pope (see PIUS IX.). The vast property, £1,600,000, bequeathed to his three brothers, was vainly disputed by a *soi-disante* daughter in a tedious and famous lawsuit (1877-9).

Antonello OF MESSINA, an Italian painter, born about 1414, who introduced into Italy the Flemish methods of oil-painting, which he had learned from the Van Eycks. He settled about 1473 in Venice, where he gained great renown as a portrait-painter, and died probably in 1493. His chief extant works are a Crucifixion at Antwerp, and a portrait in the Louvre, both of 1475, another portrait in Berlin, of 1478, and a St Sebastian at Dresden.

Antoninus, M. AURELIUS. See AURELIUS.

Antoninus, ITINERARY OF. See ITINERARY.

Antoninus Pius, TITUS AURELIUS FULVUS, Roman emperor (138-161 A.D.), was born in the reign of Domitian, in the year 86 A.D. His family came originally from Nemausus, now Nîmes, in Gaul. Antoninus inherited great wealth, and early gave proof of excellent qualities. In 120 he was made consul; afterwards he was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. In 138 he was adopted by the Emperor Hadrian, in consequence of his merit alone, and came to the throne in the same year. His reign was proverbially peaceful and happy. In his private character he was simple, temperate, and benevolent; while in public affairs he acted as the father of his people. The persecution of Christians, which was continued

during his reign, was partly stayed by his mild measures, and Justin Martyr's *Apologia* was received by him with favour. He was little engaged in war, except in Britain, where he extended the power of Rome, and built a wall between the Forth and the Clyde, as a defence against invasions by the predatory inhabitants of the north (see ANTONINUS, *Wall of*); but he was frequently employed in arbitration and general counsel on the affairs of foreign states. 'Happy the nation which has no history.' The reign of Antoninus illustrates this saying, for by his justice, wisdom, kindness, and courtesy his vast empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the record of which forms the bulk of the history of the dark centuries of the Roman empire. It is said that only one senator was impeached during

Bronze Coin of Antoninus Pius, commemorative of his victories in Britain. (From a coin in the British Museum.)

the entire reign. Literature received great encouragement; the laws were improved; commerce extended; the means of communication were facilitated by the repair of roads and bridges; new sanitary regulations were introduced; and a taste for architecture fostered in the citizens. The epithet *Pius* was conferred on him on account of his conduct in defending the memory of his predecessor Hadrian against certain dishonouring measures brought forward by the senate. Antoninus died in 161 A.D. By his wife Faustina, whom he loved in spite of her unworthiness, he had four children, three of whom died, but one lived to be the wife of Marcus Aurelius, his adopted son and successor. The so-called Pillar of Antoninus, now in the *Piazza Colonna* at Rome, is that raised by the senate in honour of Marcus Aurelius, after his victory over the Marcomanni.

Antoninus, WALL OF, a Roman rampart erected between the Firths of Forth and Clyde, in 140 A.D., during the reign of Antoninus Pius, to restrain the encroachments of the northern tribes. The superintendence of the work is generally attributed to the imperial legate, Lollius Urbicus. Following the earlier line of Agricola's forts (81 A.D.), it extended 36 miles—the eastern termination being at Carriden, on the Forth; the western, near Old Kilpatrick, on the Clyde. The work consisted of a ditch about 20 feet deep and 40 feet wide, a rampart of earth and stone about 20 feet high and 24 feet thick at the base, and on the inner or south side of the rampart a paved military road, with a chain of twenty-one forts. The line of the wall may still be traced to a considerable extent. The most perfect fragments are near Castlecary; within the park of Callendar House, Falkirk; and on the slopes at Inveravon, not far from Polmont station. It is commonly designated *Graham's* or *Grime's Dyke*—*Grim* being an old English name for the devil. See *Waldie's Northern Roman Wall* (Linlithgow, 1883).

Antonius, MARCUS (MARK ANTONY), the Roman triumvir, born about 83 B.C., belonged to

one of the oldest patrician families, and on his mother's side was related to Julius Caesar. His youth was wasted in dissipation, and finding himself pressed by creditors, he escaped to Greece in 58 B.C., where, for a while, he listened to the Athenian philosophers and orators. His studies here were soon interrupted by the proconsul Gabinius, who appointed him commander of his cavalry. In the campaign against Aristobulus in Palestine, and in Egypt, Antony distinguished himself by his courage and activity, and ingratiated himself with the soldiery. After assisting Caesar in Gaul, he went to Rome in 50 B.C., to uphold his great kinsman against the oligarchical party, and was appointed quaestor, augur, and tribune of the plebs. Next year, as one of Caesar's adherents, he was expelled from the curia, and fled to Caesar, who made this a pretext for his war against Pompey. At its outbreak, Antony received the appointment of commander-in-chief in Italy; in the battle of Pharsalia, he led the left wing of Caesar's army. In 47 B.C. he was made master of the horse by Caesar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself. He drank; he divorced his wife, and took up with an actress, Cytheris. In 44 B.C. he was made consul, and vainly endeavoured to prevail on the Romans to recognise Caesar as emperor. On Caesar's assassination, he played the part so finely described by Shakespeare; and by his funeral oration, with the well-timed display of Caesar's bloody robe, so wrought on the passions of the people, that the conspirators were forced to escape from Rome, leaving Antony in possession of almost absolute power. Next, we find him occupied in disputes and reconciliations with Octavian (see AUGUSTUS), besieging Mutina, and denounced by Cicero as an enemy of the state. The defeat of Mutina (43 B.C.) drove him a fugitive beyond the Alps; but in Gaul he visited the camp of Lepidus, and gained the favour of the army, of which he took the command. Plancus and Pollio joined him with their troops; and Antony, who so recently had escaped as a helpless fugitive from Italy, returned to Rome at the head of seventeen legions and 10,000 cavalry. Octavian, who had pretended to maintain republican principles, now threw off the mask, and held a consultation with Antony and Lepidus, near Bononia, when it was determined that these triumvirs should share the whole Roman world among themselves. To secure their spoil, they returned to Rome, and began their course of proscription and plunder. Among their first victims was Cicero, the orator whose eloquence they dreaded; and, in all, not less than 300 senators and 2000 equites are believed to have fallen. After securing Italy for themselves, and raising an enormous sum of money to carry on the war abroad, Antony and Octavian led their troops into Macedonia, and defeated Brutus and Cassius. Antony next paid a visit to Athens, and then passed over to Asia, to arrange his dispute with Cleopatra, queen of Egypt, whose conduct had offended the triumvirs. The queen herself appeared to answer his challenge, and captivated him by her beauty and address. The conqueror of Brutus and Cassius was made a prisoner, though not a prisoner of war. He followed Cleopatra into Egypt, and lived with her in idleness and luxury, until he was aroused by tidings of a quarrel in Italy between his own kindred and Octavian. This dispute gave rise to a short war, which came to an end before Antony arrived in Italy. A new division of the Roman world was now arranged, Antony taking the East, and Octavian the West, while Lepidus had to put up with Africa. Antony had confirmed his friendship with Octavian by a marriage with his sister, Octavia; but, returning now to

Cleopatra, he resumed his voluptuous mode of life, and was guilty of acts of the grossest injustice. Octavian used these facts to excite the indignation of the Roman people against Antony, and war between the rivals became inevitable. Antony, in his illness, tried to postpone the coming conflict, and filled the island of Samos (where his troops were quartered) with musicians, jugglers, and buffoons. Meanwhile, at Rome, he was deposed from the triumvirate, and war was proclaimed against Cleopatra. Each party collected its forces, and in the naval engagement of Actium (31 B.C.) Antony was defeated. His hope of finding troops still faithful to him in Libya was disappointed; and he returned to Egypt, there, with Cleopatra, once more to forget his political cares and vexations, until his amusements were suddenly interrupted by the arrival of Octavian at Alexandria. Deserted by the Egyptian fleet, as by his own army, and deceived by a false report of Cleopatra's suicide, he killed himself by falling upon his sword, in the year 30 B.C.

Antony, St. surnamed **THE GREAT**, or **ANTONY OF THEBES**, the father of monachism, was born about the year 251 A.D., at Koma, near Heraklea, in Upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having sold his possessions, and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic Church, and made him the model of monastic life. When 30 years of age, he penetrated farther into the desert, and took up his abode in an old ruin on the top of a hill, where he spent twenty years in the most rigorous seclusion; but, in 305 he was persuaded to leave this retreat by the prayers of numerous anchorites, who wished to live under his direction. He now founded a monastery, at first only a group of separate and scattered cells near Memphis and Arsinoë; but which, nevertheless, may be considered the origin of cenobite life. After a visit to Alexandria in 311, he returned to his lonely ruin. In 355 the venerable hermit, then over a hundred years old, made a journey to Alexandria to dispute with the Arians; but feeling his end approaching, he retired to his desert home, where he died, 356 A.D. Athanasius wrote his Life. His festival is kept on the 17th January.

ST ANTONY'S FIRE was the name given to a pestilential epidemic, also called the *sacred fire*, which in 1089 swept off great numbers, especially in France; it being held that many sufferers had been cured through the intercession of St Antony, especially by prayer before his relics. The disease was commonly supposed to be erysipelas, which usurped the name of St Antony's Fire; but more probably it was a form of Raphania (q.v.), caused by eating ergot of wheat or rye. See Häser, *Geschichte der Epidemischen Krankheiten* (Jena, 1867).

Antony of Padua, St. was born at Lisbon, August 15, 1195, and on the father's side was related to Godfrey of Bouillon. He was at first an Augustinian monk; but in 1220 he entered the Franciscan order, and became one of its most active propagators. He preached in the south of France and Upper Italy, and died at Padua, June 13, 1231. He was canonised by Gregory IX. in the following year. He himself practised the most severe asceticism, and opposed vigorously the movement for mitigating the severity of the Franciscan rule led by Elias of Cortona. According to legend, he preached to the fishes when men refused to hear him; hence he is the patron of the lower animals, and is often represented as accompanied

by a pig. His monument, a fine work of statuary, is in the church which bears his name at Padua.

Antraigues, EMANUEL DELAUNAY, COMTE D', a great politician, with a very ambiguous character, was born at Villeneuve de Berg, in the department Ardèche, in 1755. His talents were first displayed in his *Mémoires sur les États-généraux* (1788). This book, full of daring assertions of liberty, was one of the first sparks of the fire which afterwards rose to such height in the French Revolution. In 1789, when Antraigues was chosen as a deputy, he defended the privileges of the hereditary aristocracy, ranked himself with those who opposed the union of the three estates, and maintained that the royal veto was an indispensable part of good government. After leaving the Assembly in 1790, he was employed in diplomacy at St Petersburg and Vienna, where he defended the cause of the Bourbons. In 1803 he was employed under Alexander of Russia in an embassy to Dresden, where he wrote against Bonaparte a brochure, entitled *Fragment du XVIII. Livre de Polybe, trouvé sur le Mont Athos*. He afterwards came to England, and acquired great influence with Canning. On July 22, 1812, he was murdered, with his wife, at his residence near London, by an Italian servant.

Antrim, a maritime county in the NE. of Ireland, in the province of Ulster, stands second among the Irish counties in population, but in size only ninth. Its greatest length is 57 miles; its greatest breadth, 28; its extent of sea-coast, 90; and its area, 1192 sq. m. Of this, rather more than three-fourths is in tillage and pasture; and one per cent. under wood. Off the north coast lie Rathlin Isle and the Skerries; and off the east coast, the Maiden Rocks. The east coast is hilly; and from Larne to Fair Head, parallel mountain-ranges of no great height, and covering a third of the county, stretch SW. into the interior, forming valleys opening seaward, called the Glens of Antrim. The interior slopes towards Lough Neagh. The highest eminences are—Trostan, 1810 feet; and Slievemish, or Slemish, 1782. The principal streams are—the Bann, from Lough Neagh to the Atlantic; the Main, running parallel to the Bann, but in the reverse direction, into Lough Neagh; and the Bush, flowing north into the Atlantic. Many peat-bogs occur in the county. Six-sevenths of the surface consists of igneous rocks (trachyte-porphry and basalt-rock), often alternating with bands of a red clay or *bole*, and overlying cretaceous and jurassic strata, new red sandstone, and metamorphic rocks. The basalt-rocks, or old lava-flows, have frequently a columnar structure. Between Ballycastle and the mouth of the Bann, the basalt assumes very picturesque forms; and the Giants' Causeway (q.v.) is one of the most perfect examples of columnar basalt in the world. Fine salt-mines occur at Duncrue and Carrickfergus; and small coal-fields near Ballycastle and in the interior. Rich beds of iron ore of fine quality have been recently opened in Glenravel, and a large export has been carried on from Cushendall and Carnlough. The soil of Antrim is mostly light, and the chief crop is oats. The land is very much subdivided. The rearing of flax, and the various branches of the linen, cotton, and coarse woollen manufacture are the staple industries. The principal towns are—Belfast, Lisburn, Ballymena, Ballymoney, Carrickfergus, Larne, and Antrim (pop. 1647). County Antrim returns four members to parliament; Belfast borough, four. Pop. (1841) 351,496; (1881) 421,943, of whom 190,746 were Presbyterians, 108,344 Roman Catholics, 98,161 Protestant Episcopalians, and 11,842 Methodists. The large number of Presbyterians

is due to the fact that the county was extensively colonised from England and Scotland. The original possessors were the O'Neills, who, in 1333, regained the whole country, except Carrickfergus and part of the Glens—held by the Bissets of Glenarm. The forfeiture of Shane O'Neill, in the reign of Elizabeth, terminated the dominion of his race.

Ant-thrush, a general name applied to birds of tropical and sub-tropical countries, which feed to a large extent upon ants. The American Ant-thrushes (Formicariidæ) include a large number of noisy bush-birds, with comparatively sober plumage, while the Old-World forms (Pittidæ) are brilliant. The latter extend from the Malayan region eastwards. Both families belong to the order of Passerine birds. See BUSH-SHRIKE, PASSERES, and BIRDS.

Antwerp (Fr. *Anvers*; Flem. *Antwerpen*, 'on the wharf'), the capital of the province which bears its name, and the chief commercial city of Belgium, is situated on the river Scheldt, 52 miles from the sea, and 27 N. of Brussels. It is the Liverpool of the Continent, and the tonnage of vessels entering its port has increased tenfold within thirty years, until it stands at about 4,000,000 tons annually. The trade and manufactures of Antwerp have so extended, that the large dock and quay accommodation having been found too limited, a new quay, 2 miles in length, and docks have been constructed at a cost of nearly £4,000,000, which were opened by the King of the Belgians in July 1885. Arrangements have also been made for additional dock space on the opposite side of the Scheldt if required. The merchants of the town are noted for their enterprise, many of them being largely interested in the South American trade. Besides the railway system, the Scheldt and the canals which intersect Antwerp give communication with other Belgian towns. The imports include all the products in common use amongst an industrial and commercial community. The chief exports are flax, sugar, iron, woollen goods, metals, glass, and tallow. The manufactures consist chiefly of sugar, white-lead, cotton goods, lace, linen-thread, sewing-silk, black silk stuffs, starch, petroleum, and printers' ink. There are also to be mentioned tobacco-manufacture, the cutting of diamonds and other precious stones, and shipbuilding. The chief public institutions are—the Academy of Sciences, Academy of Painting and Sculpture, a Medical and Surgical School, Naval Arsenal, Museum (with specimens of the pictures of Rubens, Vandyck, Titian, and Matsys), Zoological Gardens, the Flemish Theatre, and the Plantin Museum (1876). The six-aisled cathedral (1352–1518), the noblest Gothic structure in Belgium, is 500 feet in length by 250 in breadth, with a roof supported by 125 pillars, and an exquisite spire, 403 feet high, in which hangs a splendid carillon of 99 bells. The interior is enriched by the two greatest of all the pictures of Rubens, the *Elevation of* and the *Descent from the Cross*. In the image-breaking riot of 1566 by the populace of Antwerp, the cathedral was at the mercy of the iconoclasts, when every statue was hurled from its niche, and every picture torn from its walls. The Church of St James contains the monument of the Rubens family. The Exchange (1531), a fine building, is said to have been Gresham's model of the old London Exchange. It was burnt in 1858, but rebuilt in the same style, and reopened in 1872. The *hôtel-de-ville* (1565) is a fine building in the Renaissance style. The old fortifications were demolished in 1860, though Alva's famous citadel (1567) stood till 1874; and since 1851 new fortifications have been erected outside the city, with

detached forts to the south-east, rendering the commercial capital of Belgium one of the most strongly fortified places in Europe. Pop. (1846) 88,487; (1873) 126,663; (1886) 198,174.

Antwerp is mentioned as early as the 8th century; in the 12th and 13th it gave signs of considerable prosperity, and in the beginning of the 16th century it was the commercial capital of the world. It

Antwerp Cathedral.

government was free, and its people prosperous and well educated. When in 1576 it was seized by the Spanish soldiery, it is estimated that 8000 human beings were murdered; and the city-hall and nearly a thousand fine buildings were burnt. The effect of this, and the assault of the Duke of Parma in 1585, caused Antwerp to sink into decay, and its population was scattered. From 1794 till 1814, while it was held by the French, Napoleon attempted to make it a great military and commercial centre. The union of Belgium with Holland in 1815 was very favourable to the commerce and general prosperity of Antwerp. By the revolution of August 1830, it was linked to the destiny of Belgium. When the revolutionary party gained possession, the Dutch commandant, General Chassé, retreated to the citadel, and, exasperated by the breach of truce, commenced a bombardment, which destroyed the arsenal and about thirty houses. In 1832 a French army of 50,000 men, under Marshal Gérard, appeared before Antwerp, to demand the surrender of the citadel, which General Chassé refused. After the interior of the citadel had been reduced to ruins by the French artillery, General Chassé capitulated. The city was handed over to the Belgians, and since the treaty of 1839, Antwerp has had a singularly prosperous career. Amongst the eminent names associated with Antwerp are the painters Matsys, Rubens, Vandyck, Teniers, Van Bree,

and Jordaens, with Van Meteren, historian, and Conscience the novelist; statues have been erected to the first five of these, as also to Leopold I., Van Ryswyck, and others. French is the business language, but the majority of the inhabitants speak Flemish.

Anu'bis, an Egyptian deity, a son of Osiris, identified by the Greeks with Hermes. He is represented on monuments as having the head of a jackal, with pointed ears and snout, which the Greeks frequently changed to those of a dog. His office, like that of Hermes *Psychopompos* among the Greeks, was to accompany the ghosts of the deceased into Amenthes, the under-world, and there along with Horus to weigh their actions before Osiris.

Anupshahr, an ill-built, crowded town of India, in the British district of Bulandshahr, North-west Provinces, on the right bank of the Ganges, 73 miles SE. of Delhi. Pop. 14,000.

Anu'ra. One of the main divisions of Amphibia, containing the frogs and toads. See AMPHIBIA, FROG, TOAD.

Anus, the term applied by anatomists to the lower, or (in the case of animals) the posterior aperture of the intestinal canal; the rectum terminating externally in the anus. With regard to its anatomy, it is sufficient to state that it is kept firmly closed on ordinary occasions by the *external and internal sphincter* muscles, the former of which contracts the integument around the opening, and, by its attachment to the coccyx behind, and to a tendinous centre in front, helps the *levator ani* muscle in supporting the aperture during the expulsive efforts that are made in the passage of the feces or intestinal evacuations; while the latter, or *internal sphincter*, is an aggregation of the circular muscular fibres of the lowest part of the rectum, and acts in contracting the extremity of the tube. The main function of the *levator ani* muscle is expressed in its name, it being the antagonist of the diaphragm and other muscles which act in the expulsion of the feces. The integument around the anus lies in radiating plaits, which allow of its stretching without pain during the passage of the feces; and the margin is provided with a number of sebaceous glands, which, in some of the lower animals, secrete strongly odorous matters (see ANAL GLANDS).

Infants are occasionally born with an *imperforate anus*, or congenital closure of the rectum. In the simplest and most common form of this affection, the anus is merely closed by thin skin, which soon becomes distended with the Meconium (q.v.), and can easily be divided. Cases where the obstruction is at a higher point are more serious; but even these can generally be relieved by a surgical operation. When this is neglected or is unsuccessful, death speedily takes place, with symptoms resembling those of intestinal obstruction from any other cause. *Spasm of the sphincter ani* is characterised by violent pain of the anus, with difficulty in passing the feces. It is almost always caused by the presence of an ulcer or fissure, or by some morbid condition in neighbouring parts. *Ulceration* occurring as a breach of surface at one or more points around the anus, but not extending within the orifice, is sometimes met with; but more common and important is *fissure of the anus*, a term applied to a crack, or superficial ulceration, situated between the folds of the skin and mucous membrane at the verge of the anus, and extending within the rectum. It gives rise to intense pain during the passage of the evacuations, and for some hours afterwards to great discomfort, smarting, and itching. The treatment to be adopted is to endeavour to procure

regular and somewhat soft evacuations, and to sponge with warm water immediately afterwards, the parts being dried with a soft cloth. In slight and recent cases, one or two applications of solid nitrate of silver, with the use of a mild astringent lotion, will sometimes cure the disease. Where the pain is severe, division of the base of the fissure by the knife, or by stretching, is usually necessary. *Pruritus ani*, which simply means intense itching and irritation of this part, is usually a symptom of morbid changes rather than a special disorder; but sometimes occurs alone, and is often a very distressing and obstinate affection. It is often associated with an unhealthy state of the intestinal secretions, or with simple constipation; with a congested state of the mucous membrane; with a disordered condition of the womb; with the presence of thread-worms in the rectum, &c.; and it is peculiarly common in persons whose occupations are sedentary. The affection is often much aggravated by the patient's being unable to refrain from scratching the parts, which leads to excoriations, ulcerations, thickening of the skin, &c. Treatment must of course first be directed to these associated conditions, when present; and with their removal the irritation often disappears. A lotion containing carbolic acid, hydrocyanic acid or cocain, or an ointment composed of a drachm of calomel to an ounce of lard, often gives relief. To prevent the reappearance of ulcerations, &c., a strong alum lotion should be used to bathe the parts night and morning. The other principal affections of the anus are *Fistula*, *Piles*, and *Prolapsus*, which are discussed in special articles.

Anville. See D'ANVILLE.

Anwari, a celebrated Persian poet who flourished during the 12th century, was born in Khorassan, and became a favourite of the Seljukide sultan, Sanjar. His poems consist chiefly of lengthy panegyrics and shorter lyrical effusions. The latter (*ghazels*) are characterised by simplicity, ease, and naturalness; but the *kasidas*, long poems mainly in praise of his patron, are disfigured by extravagant imagery and historical conceits. They abound in keen sarcasm against others. Anwari, who was also one of the most notable astrologers of his time, died between 1191 and 1196.

Aonlaganj, or AOUNLAH, a town of India, in the British district of Bareilly, 21 miles SW. of Bareilly, on the route to Aligarh. It has a large bazaar. Pop. 11,000.

A'orist (Gr. *aoristos*, 'unlimited'), a form of the Greek verb by which an action is expressed as taking place in an indefinite time. It corresponds to the simple past tense in English, as 'he died.' The Greek language is especially fertile in the past tenses of verbs, having, in addition to the tenses common to other languages—namely, the imperfect, perfect, and pluperfect—the aorist, which is peculiarly adapted to the narrative style of writing. The distinction of first and second aorist is purely formal.

Aor'ta is the great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The aorta in man is subdivided by anatomists into the arch, the thoracic aorta, and the abdominal aorta. The arch is a loop with the convexity directed upwards, forwards, and to the right side, reaching at its highest part to a level with the upper border of the cartilage of the second rib. Changing its direction, it runs from right to left, and from before backwards to reach the left side of the spine, with which it first comes in contact between the fourth and fifth dorsal vertebrae. Here it descends, and at the lower border of the fifth dorsal vertebra it becomes the thoracic aorta. Five arteries

arise from the arch—viz. two coronaries, for the supply of the muscular tissue of the heart itself; the innominate, dividing into the right common carotid and right subclavian arteries; and the left common carotid and left subclavian arteries.

Diagram of the Aorta, with its principal Branches :

- a*, ascending part of the arch of the aorta; *a*, thoracic aorta; *bb*, abdominal aorta; *c, d*, right and left ventricles of heart; *e, f*, right and left auricles of the heart; *g, h*, right and left pulmonary arteries; *i, k*, right and left common carotid arteries; *l, m*, right and left subclavian arteries; *n*, hepatic artery; *o*, gastric artery; *p*, splenic artery; *q, r*, right and left renal arteries; *s, t*, superior and inferior mesenteric arteries; *u, v*, right and left common iliac arteries; *w*, middle sacral artery; *x*, phrenic arteries; *y*, spermatic arteries.
 1, superior vena cava; 2, right internal jugular vein; 3, right subclavian vein (the left is removed to show the arch of the aorta); 4, inferior vena cava; 5, 6, right and left pulmonary veins; 7, hepatic veins; 8, 9, right and left renal veins; 10, 11, right and left iliac veins; 12, trachea.

At the commencement of the arch are three small swellings or pouches, the aortic sinuses, internal to which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood into the heart. The thoracic aorta extends from the lower border of the fifth dorsal vertebra to the diaphragm, gradually getting into the middle line of the spine. The thoracic aorta gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (usually nine on each side, the upper two intercostal spaces being supplied by a branch from the subclavian artery). The abdominal aorta passes from the diaphragm to the fourth lumbar vertebra, opposite the body of which it divides into the two common iliac trunks. The abdominal aorta gives off: (*a*) Branches to the abdominal viscera. These are either single or in pairs. The single arteries are—the coeliac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric, for the small, and part of the large intestine; the inferior mesenteric, for the large intestine not supplied by the superior mesenteric. The paired arteries are the supra-renal, renal, and spermatic or ovarian. (*b*) Branches to the abdominal walls—viz. the two phrenic arteries to the diaphragm; the lumbar arteries, four or five pairs, for the

supply of the lower part of the abdominal wall (the loins); the middle sacral or caudal artery, a small vessel which arises from the back of the aorta just above its point of bifurcation. In fish and animals with tails, this branch is the caudal prolongation of the aorta.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. The structure of the aorta will be given under ARTERIES; and the comparative anatomy under CIRCULATION.

During fetal life, there is a communication between the arch of the aorta and the pulmonary artery, called the *ductus arteriosus*, the canal of which becomes obliterated after birth. In the human carotid artery, it has been calculated that the blood-stream moves with a velocity of 10½ inches per second, and that the pressure of blood in the same vessel would support a weight of 3 lb. 2 oz. to the square inch.

The coats of the aorta are very subject to fatty disease termed Atheroma (q.v.), and in advanced life, to calcareous degeneration or deposit of lime-salts, which destroys their elasticity. This change renders them very liable to Aneurism (q.v.), which, as may be expected, is generally situated at the curves of the aorta, especially at the arch, where the force of the blood-stream is greatest.

Aosta, a cathedral city of Italy, on the Dora Baltea, 19 miles from the opening of the great St Bernard Pass, and 80 miles NNW. of Turin by rail. It is surrounded by rich orchards, vineyards, and almond plantations, but the town itself is gloomy and irregular. It is the ancient *Augusta Prætoria*; and several monuments of the Roman times still remain. St Bernard was archdeacon of Aosta; and here Anselm, Archbishop of Canterbury, was born. Near by are the celebrated baths and mines of St Didier, and the scenery in the neighbourhood is remarkably picturesque. Pop. (1881) 5672. The beautiful valley of Aosta, between the Graian and Pennine Alps, is rich in woods, pastures, and minerals, and mineral wells (including Courmayeur). Cretinism prevails to a lamentable extent, and few persons are altogether free from goitre. French is the language generally spoken.

Apaches, a tribe of North American Indians, formerly very fierce and numerous, living in portions of Texas, New Mexico, and Arizona, and belonging to the Athabaskan family. They were long the scourge of the frontiers, and resisted obstinately every attempt to civilise them. Long after the annexation of their territory by the United States, they continued their raids in spite of severe defeats. An attempt made by the United States government to confine the Apaches within a reserved territory in Arizona led to bloodshed in 1871. The numbers of the Apaches proper within the United States may be put at nearly 7000.

Apatin', a market-town of Hungary, in the county of Bacs, on the left bank of the Danube, 49 miles SW. of Theresiopol. It has manufactures of woollen cloth, and a considerable trade in hemp, silk, madder, and woad, the products of the vicinity. Pop. (1881) 11,973.

Apatite (Gr. *apatē*, 'deception'), a mineral so named because it resembles various other minerals for which it might be mistaken, consisting chiefly of phosphate of lime. The different varieties of apatite contain a little fluoride or chloride of calcium, or both, as well as phosphate of lime. Of these varieties, besides those already mentioned, there are others, as *Morozite*, *Francolite*, and *Asparagus Stone*. It occurs both massive and in crystals—which are generally small, and are often six-sided prisms, or six-sided tables, but some very large ones have been brought from Canada. It

occurs in some of the tin mines in Cornwall, Saxony, Bohemia, &c., and in rocks of various ages, as mentioned above. It is found of various colours, more or less green, blue, or red, sometimes white, and often gray. It frequently occurs, generally in the form of small needles, as a rock-constituent, in such rocks as granite, dolerite, diorite, &c. The massive radiated variety of apatite is called *phosphorite*, and when massive, earthy, and impure, it is known as *osteolite*. These massive varieties may occur in veins, beds, or irregular masses, and are perhaps most abundantly met with amongst the archæan rocks. At Estremadura, in Spain, they occur in cretaceous strata. These mineral phosphates of lime have been much used in the preparation of manures, but as they generally require expensive mining and reduction, their production has to some extent fallen off—the most abundant supplies of lime-phosphates being at present obtained from phosphatic nodules or Coprolites (q.v.). Commercially, any natural lime-phosphate is known as apatite. Hence phosphatic nodules, and the interesting 'rock-guano,' called *osite* or *Sombrerite*, are alike spoken of as apatite. Sombrerite has been obtained in large quantities from the small island of Sombrero, to the east of the Virgin Islands, in the British West Indies. It is now believed that this hard or rock guano has been formed by water filtering through ordinary guano into the coral rock adjoining, and turning it more or less completely into phosphate of lime. The general treatment to which mineral phosphate is subjected is to reduce it to powder, and act upon the pulverised matter with sulphuric acid, which renders the phosphoric acid in the apatite soluble in water, and thereby facilitates its introduction into the plant. See MANURE.

Ape, a term generally applied to the lower Primates or Simiina family, including the vast majority of monkeys, with the exception of the anthropoids on the one hand, and the lemurs, or semi-apes, on the other. Thus defined, the apes include (a) the *Arctopithecini*, or marmosets, small furry South-American forms like squirrels—e.g. Hapale and Midas; (b) the *Platyrrhini*, or broad-nosed New-World apes, almost always quadrupedal, without cheek-pouches or callosities on the hips—e.g. Mycetes or howling-monkey, Cebus or Capuchin, Ateles or spider-monkey, Pithecia, Chrysotrix or squirrel-monkey, and Nyctipithecus; (c) the majority of the *Catarrhini*, or Old-World monkeys, with a narrower partition between the nostrils, and never with prehensile tail. Only the lower forms, or Cynomorpha, are included in this classification, the higher Anthropoids being separated (after Hartmann) to form along with man the higher family Primarii. The Cynomorpha (dog-like) include Baboons (*Cynocephalus*), Mandrills (*Papio*), Macacus, the Barbary Ape (*Inuus*), Cercopithecus, Colobus, the Sacred Monkey (*Semnopithecus*), &c. See MONKEYS, ANTHROPOID APES.

Apeldorn, a flourishing town of the Netherlands, in the province of Gelderland, 17 miles N. of Arnheim. The Loo, a royal hunting-lodge, beloved of William of Orange, is in the neighbourhood. There are no less than forty paper-mills in Apeldorn, most of the paper manufactured being sent to the East Indies. Other industries are agriculture, grinding corn, copper-founding, and manufacturing blankets and coarse woollen cloth. Pop. (1883) 16,283.

Apelles, the most celebrated painter in ancient times, was the son of Pytheas, and was probably born at Colophon, on the Ionian coast of Asia Minor. He flourished in the latter part of the 4th century B.C., received his first instruction in art

under Ephorus in the Ionian school of Ephesus, and afterwards at Sicyon, and thus he united the fine colouring of the Ionian with the accurate drawing of the Sicyonic school. During the time of Philip, he visited Macedon, where he became the intimate friend of Alexander the Great. Pliny relates that on one occasion when Alexander visited Apelles in his studio, the king exhibited such ignorance of art, that the artist recommended him to be silent, as the boys who were grinding the colours were laughing at him. He is said to have accompanied Alexander on his expedition to Asia, and to have settled at Ephesus. The most celebrated paintings of Apelles were his Anadyomene, or Aphrodite rising from the Sea, the Graces, and others on similar subjects. His portrait of Alexander wielding a thunderbolt was very famous. Apelles willingly acknowledged the merits of his contemporaries. When his pictures were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is said that Apelles instantly rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place, and told the cobbler to stick to his last; or, in the Latin version, which has become proverbial, 'Ne sutor supra crepidam (judicaret).' All that we know of his art is derived from late Greek and Roman authors; but he seems to have combined many of the excellences of his predecessors. He did not belong to the noblest period of art, and seems to have been more remarkable for skilful effects and elaborate finish than for originality.

Apennines (Ital. *Appennini*, Lat. *Mons Apenninus*; from Celtic *pen*, 'a head' or 'mountain-height'), a mountain-chain extending 740 miles uninterruptedly throughout the whole length of the Italian peninsula. It belongs to the system of the Alps, from which it branches off near Savona. From this point, the chain, under the name of the Ligurian Apennines, girdles the Gulf of Genoa, in the immediate vicinity of the sea, and then runs inland, forming the watershed between the Adriatic and the Mediterranean, but gradually approaching the east coast, till, in the highlands of the Abruzzi, it is close upon it; after which it takes a southerly direction through Naples, dips under the sea at the Strait of Messina, and reappears on the northern coast of Sicily. The chain is divided by geographers into the *Northern*, the *Central*, the *Southern*, and the *Sicilian Apennines*. The leading feature of the Apennines, wherever they approach the coast, is their extraordinarily steep declivities; while in Middle Italy and the adjoining portions of Upper and Lower Italy, long terraced plateaus, lower ranges, and extensive coast-plains mark their gradual descent on the west. The main chain of the Apennines does not send off spurs into the Apulian peninsula.

The direction of the great chain of the Apennines is favourable to the formation, on the west side, of largish river-basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while on the east side we find nothing but small streams, in most cases destitute of affluents, hurrying down to the sea through wild precipitous valleys.

The average height of the entire chain of the Apennines is about 4000 feet, which, however, in the north, sinks down to little more than 3500 feet; and in the mountains of the Abruzzi, rises to 7000 feet. Here, in Monte Corno, the highest peak of the range known under the name of Gran Sasso d'Italia, they reach an elevation of 9574 feet, and in Monte Velino, of 7916 feet.

The Apennines are crossed by thirteen principal passes; and seven of these are traversed by the

railway. The strata which compose the Apennines are principally of Jurassic, Cretaceous, and Tertiary age. The central ridges, especially in the middle and south, consist largely of Jurassic limestones, &c. These are flanked on the north-east and south-west by more or less interrupted belts of Cretaceous rocks, which again are overlaid by Pliocene formations. In the north, rocks of Eocene and Miocene age predominate. The Apennines, especially the Roman and Neapolitan, are distinguished by the rich variety of marbles which they contain. Volcanic rocks abound in the middle and southern regions.

The principal chain exhibits, for the most part, a dreary and barren appearance. It looks like a vast wall, with very few projecting peaks to break its dull monotony. Only in the Abruzzi, in the Sub-Apennines, and above all, in the marble mountains of Carrara and Seravezza, do the bold and magnificent forms of the Alps appear. Where water is plentiful there is no lack of rich pastures and dense forests; but usually only thin grass and wild scrubby bushes cover the stony slopes. The greater number of the forest brooks, with deep rocky ravines, display, during summer, only a dry bed. Where the mountains dip down to the sea, as at the Riviera of Genoa and the Gulf of Naples, a rich, peculiarly southern vegetation clothes the declivities. There is no region of perpetual snow; but the summits of the Abruzzi and the lofty peaks of Lunigiana are often covered with snow from October far into May, and send their icy breath so suddenly down into the mild valleys, that the temperature in a few hours sinks 12° or 18° F.

Apennade, a town in the Prussian province of Sleswick-Holstein, at the head of a gulf in the Little Belt, 66 miles NNW. of Kiel by rail. It has a court-house, a naval school, and an excellent harbour, with a considerable amount of shipping. Pop. (1885) 6068.

Aperients are substances which are employed to cause intestinal evacuations. Many articles of food, such as oatmeal, brown bread, and bran biscuits, and fruits such as figs, prunes, and strawberries, are used for this purpose; but the term is usually applied to denote certain medicines which act upon the intestines and cause them to expel their contents. Although considerable progress has been made in recent years in the investigation of the action of various drugs upon the intestines, we are as yet unable to give a final classification to them. For practical purposes, however, we may classify aperients as follows: (1) laxatives and (2) purgatives—(a) cathartic and (b) drastic. (1) Laxatives are substances which only slightly increase intestinal action. They act without causing any irritation or griping. The chief examples of this class are manna, magnesia, olive oil, sulphur, and castor oil in small doses. (2) Purgatives—(a) Cathartics are substances which quicken or increase the evacuations from the intestines, and in their action may cause griping. Examples of this class are aloes, castor oil in large doses, rhubarb, senna, and various species of rhamnus; (b) drastics are substances which are prompt, powerful, and effective in operation. Colocynth, croton oil, elaterium, gamboge, jalap, podophyllin, and scammony belong to this class. Besides the substances already enumerated, we must mention the saline aperients—e.g. sulphates of potassium, sodium, and magnesium, tartrates of potassium and sodium, phosphate of sodium, and citrate of magnesium. Of the above drugs, bitartrate of potassium, elaterium, and gamboge act as hydragogues (Gr. *hudōr*, 'water,' and *ago*, 'I drive away'), as they tend to remove water from the system; and aloes, euonymin, iridin, mercurial preparations (blue

pill, calomel), podophyllin, and rhubarb, act as cholagogues (Gr. *cholē*, 'bile'), as they increase the evacuation of bile. Purgatives may be said to act in three ways—(1) by increasing the peristaltic action of the intestines; (2) by causing an increase of the secretion from the intestinal mucous membrane; and (3) by preventing the absorption of the fluids of the intestines. Purgatives have various uses, for they not only remove the contents of the intestines, but also prevent the accumulation of faeces in them, and the irritation such accumulation causes. They are useful in cases of dropsy, to remove excessive fluids from the body. In fever they lower the temperature, and they are of use in lowering the blood pressure in certain diseases. Lastly, in cases of hernia, aneurism, and some other disorders, they are beneficial in preventing difficulty in the act of defecation. Although the use of aperients is of undoubted benefit, yet their abuse is much to be deprecated, as to employ them habitually or promiscuously may produce serious results. There are also used as aperients many Mineral Waters (q.v.).

Apetalous ('without petals'), a term applied somewhat indefinitely to those flowering plants in which the petals are absent. It represented a distinct subdivision in A. de Jussieu's classification, *Apetalæ*—broadly corresponding to *Monochlamydeæ* (q.v.) of later authors, but is more convenient as a merely descriptive term, since the absence of petals occurs not only in entire groups, like the catkin-bearing *Amentaceæ*, but in degenerate forms in many unrelated orders. When both calyx and corolla are absent, the term *achlamydeous* (Gr. *chlamsy*, 'a covering') is often used.

Aphasia is the term originally introduced by Trousseau to denote the inability to express thought by means of speech which follows certain diseases of the brain; in recent years, however, it has obtained a wider significance, and may now be defined as the loss of the faculty of interchanging thought, without any affection of the intellect or will. The interchange of thought involves, in the first place, the expression of mental processes by means of conventional symbols, and, in the second place, the comprehension of these symbols. Language, in its widest sense, includes all the methods by which thought may be communicated, and makes use of three classes of symbols—gestures, speech, and writing. The interchange of thought may be interrupted by derangement (1) of the expression of mental processes by their corresponding symbols, or (2) of the comprehension of the meaning of these symbols. In other words, there may, on the one hand, be an interference with the channels through which thought is translated into symbols; and, on the other hand, there may be a derangement of the channels by means of which symbols are interpreted as thought. In the former case, the change affects the mechanism conducting from the mental idea to the symbol, which is often termed the motor symbol process; in the latter, there is an alteration in the mechanism conducting impulses from the symbol to the mental idea, often called the sensory symbol process. There is therefore a motor and a sensory aphasia, and either of these may affect one or more of the three classes of symbols mentioned above.

In *motor aphasia*, there is a loss of the memory of the co-ordinated movements necessary for the formation of symbols, and this usually includes gestures, speech, and writing. The inability to write is commonly termed *agraphia*. The patient is unable to originate the name of any object shown to him, although he evidently knows what it

is, and he cannot reply to any question although he clearly understands it. Sometimes when he is shown an object and asked if it bears a name mentioned, he may be able to show acquiescence or dissent by means of gestures, but usually even this power is absent. In *sensory aphasia*, there is loss of the memory of the meaning of symbols. This may affect the recollection of spoken language. The patient can hear every sound, but cannot understand a single spoken word. He can speak himself with more or less fluency, but without understanding his own words, or detecting any errors he may make, and in speaking he usually commits many mistakes; he can also read printed and written language, and he can write himself. This condition is termed word-deafness. Sensory aphasia may also be due to a loss of the recollection of written, printed, or gesture language. The sight is sufficiently good to enable the patient to distinguish objects clearly in most cases (although the extent of the field of vision is often somewhat diminished), and he can name these objects quite correctly. He is able to converse perfectly, and to write either his own thoughts or to dictation, but he cannot read what he has written, or detect any mistakes in it. He can slavishly copy printed and written words, as if he were drawing, without understanding their meaning, and he copies all mistakes. This is what is known as word-blindness.

It must never be forgotten that all these varieties of aphasia are entirely independent of any affection of the intellect. Aphasia must further be carefully distinguished from mere loss of speech caused by difficulty in articulation due to paralysis. This condition is commonly known as *aphemia*. Turning to the localisation of the diseases which cause the different varieties of aphasia, we find that our knowledge has recently been much extended, not only by the careful observation of clinical and pathological facts, but also by the results of experimental investigation. These two methods of inquiry are both of great use in checking their several facts. While the individual muscular acts required in the motor symbol process are ruled by centres in the spinal cord and medulla oblongata, the seat of the memory of their co-ordinated movements is in the brain. It may be well to mention here that the nerve-impulses cross from one side of the body to the other in their course from centre to periphery, and *vice versa*. While the majority of mankind therefore are right-handed, they are also left-brained. This greater use of the left half of the brain applies to the communication of ideas in every way. No doubt the right side takes up the work of the left, after a time, in the case of any lesion, and this is more especially the case when the affection has come on in early life. In the lower part of the frontal lobe of the brain are situated the centres concerned in the co-ordination of the muscular acts in articulation, the exact position being the third or lowest convolution, usually called Broca's convolution in honour of the distinguished man who first pointed out the connection between disease in this spot and aphasia. Any lesion in this region causes motor aphasia, and if both sides of the brain are affected, this will be complete and permanent. A little higher in the frontal lobe are the centres for gesture and for writing. The auditory perception of words has its centre in the highest convolution of the temporo-sphenoidal lobe. Disease of this part of the brain causes word-deafness. The visual perception of words depends on the integrity of the angular gyrus of the parietal lobe, and if this convolution is affected, the symptom described as word-blindness ensues. See BRAIN.

Aphelion, that point in the elliptical orbit of a planet which is most remote from the sun. The opposite point, or that nearest to the sun, is styled the Perihelion. At the former point, the swiftness of the planet's motion is least, and begins to increase; at the latter, it is greatest, and begins to decrease. This irregularity of motion is most remarkable in comets whose orbits deviate most from the circle. The word is a Grecised form of Kepler's Lat. *aphelium*, from Gr. *apo*, 'from,' and *helios*, 'sun.' See APSIDES, ORBIT.

Aphemia (Gr., 'voicelessness'), a form of Aphasia (q.v.), in which words are understood and remembered, but the power to utter them is lost.

Aphides (Gr.), a family of small 'plant-lice' belonging to the order of hemipterous insects. They occur very abundantly in temperate regions as parasites on the roots, leaves, stems, &c. of plants, to which they frequently do great damage. Towards the tropics they seem to be replaced by the families to which the cochineal insects and Cicadas belong. The Rose Aphis, the 'colliers' of the bean-plant, the cottony 'American blight' of apple-trees, and the Phylloxera (q.v.) of vines, are too familiar representatives of the family. The mouth organs are adapted for piercing and sucking plants, and consist of four long sharp stylets within a proboscis or sheath. The posterior end of the body usually bears two projecting honey-tubes, which emit a sweet secretion. Wings may be absent in both males and females, but are usually present in the former, and absent in a section of the latter to be afterwards noted. The legs are long and slender, but not adapted for rapid movement; in fact, the aphides rarely wander far from their birthplace, except during the spring and autumn migratory flights of the females. Many forms migrate at the beginning of summer to another kind of plant, and return in autumn to their original haunt; but others seem to restrict their attentions to one form. The body is often brightly and protectively coloured—very frequently green or brown. They are generally dusted over with a protective mealy substance, and many forms exhibit a silky or cottony coat, secreted from skin glands.

Their presence is readily detected by marks, wrinkles, or abnormalities on the infested plant, and notoriously also by the 'honey-dew' which they secrete. This glutinous sweet substance which covers the leaves of trees, &c., especially during warm weather, is sometimes abundant enough to drop to the ground. It has excited interest from very early times, and has a widespread popular reputation for medicinal virtues. Pliny hesitates whether he ought to regard it as 'the sweat of the heavens, the saliva of the stars, or a liquid produced by the purgation of the air.' It is, however, a by-product, perhaps manufactured within the aphid from the juices of the plant on which it preys, or very probably an excretion, if not even a mere overflow, of surplus undigested glucose. The secretion oozes out from the honey-tubes above referred to, but similar products have also been observed to issue from the anus. Ants and other insects greedily hunt for this luxury, and the latter have been seen tickling the aphides to induce secretion. They also tend, protect, and imprison these valuable sources of sweetness, which Linnaeus long since expressively called their 'cows' (see ANT). Besides injuring or killing plants by preying upon their juices, the aphides produce abnormal growths and Galls (q.v.). These are often of considerable size, and sometimes exhibit a protective mimicry of fruits. They serve as the homes or cradles of the parasites. The reproductive relations have been for long noted on account of the

prevalence of Parthenogenesis (q.v.), or reproduction without fertilisation. At the end of autumn both male and female forms may be observed; and the fertilised eggs deposited in some safe place are hatched in spring, and give rise to female parthenogenetic forms, which are usually winged, and produce their young alive. Throughout summer there is a constant succession of parthenogenetic, viviparous females, and the number of generations appears to be limited only by temperature and food-supply. The return of autumn, however, means of course lowered temperature and scarcity of food, and these conditions are associated with the production of males. These fertilise the females, which are at this stage wingless, and the winter eggs are then laid. It appears that males may sometimes occur along with the viviparous forms, and that the latter may perhaps occasionally hibernate; but it is nevertheless demonstrable that warm weather and abundant food are conditions which result in the production of parthenogenetic females, while scarcity of food and cold weather cause the reappearance of males, and consequent sexual reproduction. Thus Réaumur succeeded in rearing above fifty parthenogenetic generations, all descended from one mother, by keeping up, for three or four years, an artificial summer. The experiment has been often repeated, and the viviparous parthenogenesis retained for even longer periods. The viviparous females are

Fig. 1.—*Aphis padi*. (After Kessler.)

The figure represents equally well, 1, the autumn forms—the sexual male and the wingless female, the parents of the spring brood; 2, winged and wingless viviparous parthenogenetic forms occurring in spring; and 3, an autumn winged female appearing after a succession of wingless forms.

frequently equipped with wings, which are generally absent in the egg-laying forms. They differ in other respects, but especially in the simplified structure of the reproductive organs, from which the young are developed by a process comparable to internal budding. So, too, the early spring forms, arising from fertilised eggs, resemble their sexual parents, and differ markedly from their parthenogenetic progeny. The eggs of aphides develop into active six-footed larvæ, which moult several times (see METAMORPHOSIS), and give rise to six-footed pupæ, which finally become imagoes.

It is quite impossible to give in figures any idea of the prolific increase of these luxurious parasites. Even during its short lifetime an aphid may have a progeny computable only in billions. A score may be born in as many hours, and these become in a few days the founders of new families. From a form producing only one per day, a population of not less than the fifteenth power of 210 would be the result at the end of 300 days, while an even more moderate computation given by Huxley

shows that the tenth brood alone would weigh more than 500 millions of stout men. The increase

is continually checked, however, by storms and sudden changes of weather, and also by the voracity of birds and insects. Some insects regularly feed upon aphides, while others deposit their ova in their living bodies (see ICHNEUMON), and thus utilise them as living cradles for their young, which, in such cases, are literally born out of death. Favouring circumstances sometimes lead to the appearance of extraordinary swarms of aphides, which have been noted in local histories as 'darkening the sun,' and have left a more permanent mark in the destruction of certain crops. In this connection the tiny plant-lice are of some economic importance. Apart from the vine insect *Phylloxera* (q.v.), which does so much damage in the vineyards of the Continent and North America, the aphides of turnip, cabbage, potato, bean, apple, pear, larch, &c. have frequently been the cause of widespread loss. The price of hops varies from one year to another very much according to the prevalence of the 'fly.' For the last hundred and fifty years aphides have been unremittingly studied. Their life-history was first precisely investigated by Réaumur and Bonnet, and many of the most noted naturalists have continued their researches. The reader is referred to G. B. Buckton's Ray Society Monograph on British Aphides (4 vols. 1876); and Miss Ormerod's work on *Injurious Insects* ought to be consulted for practical purposes.

Aphonia. This term is applied to loss of voice from whatever cause arising. Normally, the production of the voice is due to (1) the tension of the vocal chords, and (2) respiratory effort. Loss of voice may therefore depend upon (1) laryngeal disease or (2) deficient respiratory power. The morbid conditions of the larynx may be either functional—as in hysterical aphonia—or organic, when the lesion is either situated in the larynx, or due to an affection of the laryngeal nerves or nerve centres. See LARYNX. The vocal chords themselves may be more or less destroyed, and yet a certain amount of vocal power remain, because it sometimes happens that the false chords come together, and when they are caused to vibrate by the passage of air, produce a harsh, but distinct voice. Loss of voice may also—as could be inferred from what has just been stated—arise from diseases of the respiratory organs or general weakness. The treatment must of course depend upon the morbid condition which causes loss of voice, and can only be determined in each case after careful examination with the laryngoscope.

Aphorism (Gr.), a principle expressed tersely in a few words, or a short and pithy sentence conveying a general truth; such as, 'Use is second

Fig. 2.—Owen's figure, showing life-history of *Aphis*:

a, the first spring form developing from fertilised ovum; b, the succession of parthenogenetic viviparous forms; c and d, the reappearance of sexual individuals, male and female, in autumn; e and f, the appearance of sexual forms at an earlier date.

nature.' A whole work is sometimes written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection. Occasionally impressive, this style is more often wearisome. The name was first used in the *Aphorisms* of Hippocrates.

Aphrodité, one of the chief divinities of the Greeks, the goddess of love and beauty, so called because she was sprung from the foam (*aphros*) of the sea. She was the wife of Hephæstus, but she loved besides, among gods, Ares and Dionysus, and among mortals, Anchises and Adonis. The chief places of her worship in Greece were Cyprus and Cythera. Aphrodite not only surpassed all other goddesses in beauty, but she had the power of granting irresistible beauty and attractiveness to others, especially to wearers of her magic girdle. The sparrow, the dove, and the swan were sacred to her, as also the myrtle, the rose, and the poppy. In the later poets, Eros is her son and her constant companion. Only such sacrifices as flowers and incense were made to Aphrodite. In earlier times the patroness of marriage and maternity, she became later the ideal of graceful womanhood, and was spiritualised by Plato as *Aphrodite Urania*. By others she was degraded in *Aphrodite Pandēmos* to be the patroness of mere sensual love. Mysteries of an impure kind formed part of the ceremonial of the *aphrodisia*, or festivals held in her honour. The worship of Aphrodite was undoubtedly of Eastern origin, and she was originally a symbol of the fructifying powers of nature. Her cult was introduced by the Phœnicians into Cyprus, and soon spread over all Greece. She was originally identical with Astarte, the Ashtoreth of the Hebrews. By the Romans she was identified with Venus, hitherto one of the least important Roman divinities (see *VENUS*). Aphrodite has had the most important place in the history of art as the Greek ideal of feminine grace and beauty. Her most famous statue in antiquity was that of Praxiteles at Cnidus; her most famous picture, the *Aphrodite Anadyomene* of Apelles. The finest statues of the goddess that still exist are those of Melos (Milo) at Paris, of Capua at Naples, and of the Medici at Florence.

Aph'thæ are small whitish ulcers, usually commencing as vesicles, on the surface of a mucous membrane. The whitish substance generally contains large quantities of a minute fungus, *Oidium albicans*. They are painful, and may be extremely so. The most common site of aphthæ is the mucous membrane of the lips and mouth, but they occasionally appear wherever mucous membrane approaches the skin.

Infants are liable to an aphthous eruption termed *Thrush* (q.v.). Aphthæ in adults are generally a consequence of fevers and other diseases, or a symptom of disturbance of the digestive system. In some cases of pulmonary consumption, they form a painful addition to the patient's sufferings. In ordinary cases of aphthæ, a preparation of borax, or some antiseptic wash, generally effects a rapid cure. Where the pain is severe, a simple application of solid nitrate of silver is the best remedy.

A'piary. See *BEE*.

Ap'icius, *MARCUS GABIVS*, a Roman epicure, who lived in the times of Augustus and Tiberius, and was celebrated for his luxurious table and his acquirements in the art of cookery. It is said that when he had spent £800,000 upon his appetite, and had only some £80,000 left, he poisoned himself in order to avoid the misery of plain diet. Two other gourmands—one a contemporary of

Sulla, the other of Trajan—bore the name Apicius. The Roman cookery-book, *Celii Apicii de Opsonis et Condimentis, sive de Re Culinaria, Libri decem*, ascribed to Apicius, must belong to a much later time, inasmuch as it abounds in inaccuracies and solecisms. Its author thought proper to recommend his work to gourmands by affixing to it the celebrated name of Apicius.

Apion, a Greek grammarian, was born at Oasis in Libya, but educated in Alexandria, which he affected to consider his birthplace, from a wish to be thought a pure Greek. Settling at Rome about 30 A.D., he became famous as a teacher of rhetoric. He seems to have been as remarkable for his loquacious vanity as for his knowledge and real oratorical power. From his ostentatious disputations Tiberius used to call him *Cymbalum Mundi* ('the cymbal of the universe'). With the exception of one or two fragments, the whole of Apion's numerous writings are lost. These included a work on the text of Homer; a work on Egypt, which contained the far-famed story of 'Androclus and the Lion,' preserved by Aulus Gellius; a work against the Jews, to which Josephus replied in his work *Against Apion*; and one in praise of Alexander the Great.

Apios, a North American plant of the pea order (*Leguminosæ*), with tuberous, starchy, edible rhizomes. Attention was specially directed to it by the French traveller Lamare-Picquet, but attempts at cultivation have not been to any practical extent successful.

Apis, the bull worshipped by the ancient Egyptians, who regarded it as a symbol and incarnation of Osiris, the husband of Isis, and next to Râ, the great divinity of Egypt. A sacred court or yard was set apart for the residence of Apis in the temple of Ptah at Memphis, where a numerous retinue of priests waited upon him, and sacrifices of red oxen were offered to him. His movements, choice of places, and changes of appetite were religiously regarded as oracles. It was an understood law that Apis must not live longer than twenty-five years. When he attained this age he was secretly put to death, and buried by the priests in a sacred well, the popular belief being that he cast himself into the water. If, however, he died a natural death, his body was solemnly interred in the Temple of Serapis at Memphis, and bacchanalian festivals were held to celebrate the inauguration of a new bull as Apis. As soon as a suitable animal was found having the required marks—black colour with a white square on the brow; the figure of an eagle on the back, and a black knot in the shape of a cantharus under the tongue (*scarabeus*)—he was led in triumphal procession to Nilopolis at the time of the new moon, where he remained forty days, and was afterwards conveyed in a splendid vessel to Memphis. The worship of the golden calf by the Israelites in the wilderness, and also the employment of golden calves as symbols of the deity by Jeroboam, have been very generally referred to the Egyptian worship of Apis.

A'pis, Apidææ. See *BEE*.

A'pium. See *CELERY*.

Ap'lodon, the name of a small rodent animal; better written Haplodon (q.v.) or Sewellel.

Apnœa, an abnormal state of the animal organism during which there is a complete cessation of breathing. It is brought about by too vigorous artificial respiration, as the result of which the blood contains more than the normal quantity of oxygen, and the respiratory nervous centre which controls the breathing is unstimulated and in a state of complete rest. See *RESPIRATION*.

Apoc'alyptse. See *REVELATION OF ST JOHN*.

Apocalyp'tic Number is the mystical number 666, spoken of in the Book of Revelation (xiii. 18). Among the Greeks and Hebrews the letters of the alphabet were used to denote numbers. Hence such letters must be taken as will, when used as numbers, make up 666 (either in the Greek or Hebrew alphabet) as the letters of the name in question. The best solution of the riddle is 'Neron Kesar,' the Hebrew form of the Latin 'Nero Cæsar.' The vowels *e* and *a* are not expressed in the ancient Hebrew writing. The number represented by **NERON KESAR** would be 666, thus:

$$\begin{array}{ccccccc} \text{N} & \text{R} & \text{O} & \text{N} & \text{K} & \text{S} & \text{R} \\ 50 & + & 200 & + & 6 & + & 50 & + & 100 & + & 60 & + & 200 & = & 666. \end{array}$$

Other interpretations were adopted in early times, as *Antichrist* and *Lateinos*, the latter being supposed to refer to the Roman empire, and even in more recent times being explained by Protestant controversialists of greater zeal than discretion, as a prophetic allusion to papal Rome. See **ANTI-CHRIST**.

Apocalyptic Writings are such as, like the prophecies of Daniel, their prototype, set forth in a figurative and pictorial manner the future progress and completion of the world's history, especially in its religious aspects. The two apocalyptic books received into the canon of Scripture are the books of Daniel and the Apocalypse specially so called, the Revelation of St John. But Jewish and early Christian literature produced numerous apocalypses from about 170 B.C. to 130 A.D. Most of them were attributed to famous men of old by their authors. They deal largely with the increasing troubles and trials of God's people, and their final redemption and salvation by God's mighty works or Christ's special appearance again. The Book of Enoch (q.v.) is the best known of the non-canonical Jewish apocalypses; it dates from the later Maccabee period; another is the apocalypse of Ezra. The Shepherd of Hermas (q.v.) is the most important Christian work of this kind. See Hilgenfeld, *Die Jüdische Apokalyptik* (Jena, 1857).

Apocarpous Fruits, in Botany, are those fruits which are the produce of a single flower, and are formed of only one carpel, or of a number of carpels remaining free and separate from each other. The term is derived from the Greek *apo*, implying separation, and *carpos*, fruit.

Apocatas'tasis, in Theology, the final restitution of all things, when at the appearance of the Messiah the kingdom of God shall be extended over the whole earth (Acts, iii. 21). In a dogmatic sense, the name is applied to the future conversion of all men to the faith of Christ, and their consequent admission to everlasting blessedness. This idea was extended by Origen to imply the final conversion and salvation of all individuals, even the devil and his followers not excepted. Origen's belief was held also by Didymus of Alexandria, Gregory Nazianzen, Diodorus of Tarsus, and Theodorus of Mopsuestia, but was emphatically condemned as heretical by the orthodox. Yet it has often appeared since, as in Scotus Erigena in the 9th century, and in the 19th century in the so-called 'mediation theology' (*Vermittelungstheologie*).

Apocrenic Acid (Humic Acid, Ulmic Acid) is one of the products of the natural decay of wood or other plant textures, and is found where woody fibre is decomposing in soils. It is soluble in water, and is an intermediate step in the assimilation by living plants of dead vegetable matter.

Apoc'rypha (a Greek word meaning 'hidden,' 'secret') seems, when applied to religious books or writings, to have been used (1) for such as were suitable, not for the mass of believers, but for the

initiated only; works containing the esoteric or recondite teaching of the faith or sect; (2) works the date, origin, and authorship of which were unknown or doubtful; (3) works which claimed to be what they were not, were spurious or pseudographic. When the Apocrypha is spoken of, the Apocrypha of the Old Testament is generally meant. Another large group may be called the apocryphal books of the New Testament.

The Apocrypha of the Old Testament is the fourteen books, or parts of books, which are found in the Septuagint or Greek version of the Old Testament, but are not in the Hebrew or Palestinian canon. The Palestinian Jews recognised only the Law, the Prophets, and such Hagiographa or sacred writings as were held to have been composed before the succession of prophets had ceased. The Septuagint, translated from the Hebrew at various dates, ultimately included a number of admittedly later works, some of them originally composed, not in Hebrew, but in Greek, whose relation to the old canon was not very precisely defined. These books are: (1) First (or Third) Esdras; (2) Second (or Fourth) Esdras; (3) Tobit; (4) Judith; (5) The parts of Esther not found in Hebrew or Chaldee; (6) The Wisdom of Solomon; (7) The Wisdom of Jesus, the son of Sirach, or Ecclesiasticus; (8) Baruch; (9) The Song of the Three Holy Children; (10) The History of Susanna; (11) Bel and the Dragon; (12) The Prayer of Manasses, king of Judah; (13) First Maccabees; (14) Second Maccabees. The more important of these are treated in separate articles. They differ much in character and value. Some show manifest traces of Persian influence; others are mainly Palestinian in origin and spirit; others seem to have been written in Egypt, and reflect Greek or Alexandrian modes of thought. They date mainly from the 1st and 2d centuries B.C., and fall into three groups—historical or legendary, prophetic, and didactic or philosophical. Various as they are, the Apocrypha of the Old Testament are invaluable to the careful student of biblical literature and biblical theology. Though manifestly inferior to the canonical books in religious power and literary form, they almost everywhere reflect the current religious views of the Jews at the time of Christ's coming, the marvellous continuity of Jewish national feeling, unbroken faith in times of feebleness and trouble, and unconquerable hope in a noble and more glorious future. Theologically, they mark, in some ways, a development from the old Jewish standpoint, and a distinct approximation to the thought of the New Testament—in the doctrine of Wisdom, for example, which sometimes seems the personification of the Spirit of God, sometimes comes very near the *Logos*, the Messiah of the New Testament. The angelology also is nearer that of the New Testament than the Old. Prayer for the dead is sanctioned by 2 Maccabees xii.

The early Greek fathers, using the Septuagint, treated the apocryphal books very much as they did the canonical books; but from the Council of Laodicea (360 A.D.) onwards, the Greek Church had never given the 'ecclesiastical' books (as the Apocrypha came to be called) the same rank as the canonical ones. In the Western Church, Jerome and others recognised only the Palestinian canon; but Augustine gave the weight of his authority to the opposite view. While, in the middle ages, the 'ecclesiastical' books were perhaps most usually distinguished in some measure from the canonical Scriptures in authority, the Council of Trent took Augustine's view, and anathematised those who do not accept the Apocrypha contained in the Vulgate (omitting 1st and 2d Esdras, and the Prayer of Manasses) 'as sacred and canonical.' Luther held them 'not

equal to Holy Scripture, but as good and useful for reading.' The Reformed Church generally emphasised this distinction. The articles of the Church of England declare that they are to be read 'for example of life and instruction of manners,' but not 'to establish any doctrine;' but many of the parts of the Apocrypha read as lessons were excluded from the lectionary sanctioned in 1871. The Westminster Confession, and most of the non-Anglican churches in Britain and the United States, regard them as 'of no authority,' 'nor to be any otherwise approved or made use of than other human writings.' A bitter controversy in Scotland, in 1825-27, as well as in England, led to the omission of the Apocrypha from the Bibles circulated by the British and Foreign Bible Society; and the quotation from Wisdom iv. 13, 14, on the memorial to Prince Albert at Balmoral in 1862 revived debate on the subject. Many good people regard the Apocrypha, not with indifference, but with antipathy, as books that falsely claim to be part of the inspired Word of God.

Besides those actually included in the Septuagint, there were numerous Jewish apocryphal works, notably the Book of Enoch and others usually called Apocalyptic Writings (q.v.), the Psalms of Solomon, the Book of Jubilees, and others.

The apocryphal books of the New Testament stand on a different footing: no considerable part of the Christian Church has included any of them in the canon, and most of them have been always explicitly rejected as without authority, or as fabulous. But the name has been used of very different works. Thus the First Epistle of Clement is found in the Codex Alexandrinus, and is quoted by some of the fathers as Scripture; the Shepherd of Hermas, the Martyrdom of Polycarp, and the Epistle of Barnabas, for a time received like honour from early Christian writers (see APOSTOLIC FATHERS, and the articles on these several books). The gospel according to the Hebrews (also called gospel of the Nazarenes, and gospel according to the Apostles) was the gospel of the Ebionite Christians. This is lost; and we know little but the names of the gospels used by Marcion (probably a form of Luke's gospel) and Basilides, the gospels according to the Egyptians, to Thomas, to Matthias, to Bartholomew; or of the Acts of Peter and of Paul, the Preaching of Peter, the Revelation of Peter; and other works named by Eusebius, Origen, and others. Another group of apocryphal works has actually come down to us, and was at one time widely read. More than one of them are gospels of the infancy of Christ, and tell marvels of his boyhood. To these belong the Protevangelium of James, and the gospel of Thomas. The Gesta Pilati, and others, deal with Christ's death. Tischendorf has edited the several apocryphal gospels, Acts, Epistles, and Apocalypses that have been preserved; see translations by Cowper (1874), and by Walker (in Clark's *Ante-Nicene Library*, vol. xvi.). The other fragments of gospels have been edited by Hilgenfeld. For the Old Testament Apocrypha, see the edition with a commentary by Wace (2 vols., uniform with the *Speaker's Commentary*), and that by Churton. See also the Introductions to the Old and New Testament generally. A middle position between the New Testament Apocrypha and the canon was long held by the Antilegomena of the New Testament, whose claims to authority were long disputed in the early church, though they were ultimately everywhere accepted as canonical. These were the books of 2 Peter, 2 and 3 John, the Epistles of James and Jude, Hebrews, and Revelation of St John. See Lipsius, *Die Apokryphischen Apostelgeschichten und Apostellegenden* (1883); and the article BIBLE.

Apocynaceæ, or APOCYNÆÆ, a natural order of corollifloral Dicotyledons, chiefly tropical shrubs and trees, but represented in Britain by the Periwinkle (q.v.), and in South Europe by the Oleander (q.v.). The milky juice is usually poisonous, but sometimes drinkable (see COW-TREE). It is a frequent source of Caoutchouc (q.v.). Some yield indigo, and a few (*Carissa*, *Hancornia*) bear edible fruits; but the majority are poisonous, notably the Tanghin (*Tanghinia*), or ordeal-seed of Madagascar. Canadian hemp (*Apocynum cannabinum*) yields a strong fibre, long known to the Indians. Some Apocynaceæ are cultivated as hot-house plants, especially *Allamanda*.

Apodictic (from the Greek verb 'to prove'), a logical term signifying a judgment or conclusion which is necessarily true; or, in other words, a judgment of which the opposite is impossible. No apodictic judgment can be founded on experience.

Apogamy. See FERN, REPRODUCTION.

Apogee (Gr. *apo*, 'from,' and *gē*, 'the earth'), properly speaking, the greatest distance of the earth from any of the heavenly bodies. Its application, however, is restricted to the sun and moon, the sun's apogee corresponding to the earth's aphelion, and the moon's apogee being the point of its orbit most remote from the earth. Apogee is opposed to perigee.

Apolda, a town of Saxe-Weimar, 9½ miles NE. of Weimar by rail. It is a place of much industrial activity, having extensive manufactures of hosiery, which are amongst the most important in Germany. They employ about 7000 workers, men and women, in and about the town. There are also dye-works, machine-works, and bell-foundries. Pop. (1867) 8882; (1885) 18,061.

Apollinaris the Younger, Bishop of Laodicea in Syria (died 390 A.D.), and one of the warmest opponents of Arianism. His father, Apollinaris the Elder, who was presbyter of Laodicea, was born at Alexandria, and taught grammar, first at Berytus, and afterwards at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavoured to supply the loss by converting the Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions after the manner of Homer, Pindar, and the tragedians; whilst the New Testament formed the groundwork of dialogues in imitation of Plato. But it was chiefly as a controversial theologian, and as the founder of a sect, that Apollinaris is celebrated. He maintained the doctrine that the *Logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualised and glorified form of humanity. This doctrine was condemned by several synods, especially by the Council of Constantinople (381), on the ground that it denied the true human nature of Christ. The heresy styled Apollinarianism spread itself rapidly in Syria and the neighbouring countries, and, after the death of Apollinaris, divided itself into two sects—the Vitalians, named after Vitalis, Bishop of Antioch; and the Polemeans, who added to the doctrine of Apollinaris the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration.—Apollinaris must not be confounded with Claudius Apollinaris, Bishop of Hierapolis, in Phrygia (170 A.D.), who wrote an *Apology* for the Christian faith, and several other works, all of which are lost.

Apollinaris Water, an alkaline mineral water containing carbonate of soda, derived from

the Apollinaris Spring in the valley of the Ahr, in the Rhine province. It is rich in carbonic acid, and is popular for table use.

Apollo (Gr. *Apollōn*) may be regarded as the characteristic divinity of the Greeks, inasmuch as he was the impersonation of Greek life in its most beautiful form, and the ideal representative of the Greek nation. His mild worship, with its many festivals, accompanied as they were by a cessation from all hostilities; his various shrines at sacred places, with their oracles; and the general idea of his character, had a wide, powerful, and beneficent influence on social and political life throughout the states of Greece. Homer and Hesiod mention that he was the son of Zeus and Leto, and twin-brother of Artemis, but neither states where he was born. The Ephesians believed that he was born in a grove near their city. The most popular legend was that which made him a native of Delos, one of the Cyclades, where his mother Leto, followed by the jealous wrath of Hera over land and sea, at length found rest and shelter, and was delivered of him, under the shadow of a palm or olive tree, at the foot of Mount Cynthus. To spite Hera, who was far from being a favourite with the other goddesses, these hastened to tender their services to the weak and wearied Leto. Themis fed the young Apollo with nectar and ambrosia, the food of the gods, which seems to have suddenly excited the self-consciousness of the infant deity, as he surprised his nurse by starting to his feet, demanding a lyre, and announcing his intention of henceforth revealing to mortals the will of Zeus. The island, proud of having been the birthplace of the god, adorned itself with a robe of golden flowers.

In ancient literature Apollo is described as possessed of many and various powers, all of which, however, appear to be intimately related to each other. He is spoken of: (1) As the god of retributive justice, who, armed with bow and arrows, sends down his glittering shafts upon insolent offenders. In this character he appears in the opening of the *Iliad*. (2) As the instructor of bards, and the god of song or minstrelsy, playing upon the phorminx or seven-stringed lyre, and singing for the diversion of the other deities when engaged in feasting. (3) As the god of prophetic inspiration, especially in his oracle at Delphi. (4) As the guardian deity of herds and flocks, as in his care of the flocks of King Admetus at Phææ in Thessaly. (5) As the god of medicine, who affords help, and wards off evil. In this sense he is represented as the father of Asclepius (*Æsculapius*), the god of the healing art. (6) As a founder of cities, and the spiritual leader of colonists. According to Homer, he assisted in building the walls of Troy. Cyrene, Naxos in Sicily, and other cities, venerated him as their founder. By the later writers he was identified with Helios, the sun-god, though Homer describes the latter as a distinct deity. Several critics, however, have regarded Helios, or the sun-god, as the true original Apollo—an opinion supported by many probabilities. In the Greek mythology, Apollo forms with the supreme Zeus and Athene a kind of divine triad. He is the beloved son of Zeus, the revealer of his counsel, one in mind and will with him.

The predominance of his worship, carried with them by the wide-spreading Greek colonies, who were under his peculiar care, marks a higher stage in the development of Greek religion, by which a limit was put to the polytheistic idea, and the ethical took the place of the merely physical. Apollo could only be approached with a pure heart, and self-examination was the first condition of his discipleship. It was from the Lycians that his worship came to Greece, and it was by them first that the lofty ideal of the humanisation of deity

was conceived. His worship touched the glowing imagination of the Greek, and thus in Apollo, the saviour and purifier, the guide to self-control without self-mortification, Greek religion may be said to have reached the climax of its development. His oracle at Delphi inculcated a really high standard of religious life for three hundred years, and it was not till about the end of the 6th century B.C. that it began to decline. It is significant that it was the Apollo worship that won the heartiest homage of Socrates. It was to the Greek art and philosophy that it owed its development into the ideal of humanity, and it ever constituted the brightest side of the Greek mind. The most celebrated oracles of Apollo were at Delphi, Abæ in Phocis, Ismenion in Thebes, Delos, Claros near Colophon, and Patara in Lycia. One of the most common epithets for Apollo is *Phæbus* ('the bright' or 'pure'), which occurs in Homer, and later was applied to Apollo more particularly as the sun-god. Another was *Smintheus*, most probably from *smynthos*, 'a mouse,' there being a statue of the god at Chryse with a mouse under its foot, while on coins he frequently carries a mouse in his hands (see Lang's *Custom and Myth*). Among the Romans, the worship of Apollo was practised as early as 430 B.C., and prevailed especially under the emperors. But there can be no doubt that the Romans derived their conceptions of Apollo entirely from the Greeks. It was in honour of him and his sister Diana (Artemis) that the *ludi seculares* were celebrated every hundred years. The attributes of Apollo are the bow and quiver, the cithara and plectrum, the snake, raven, shepherd's crook, tripod, and laurel; less frequently, the grasshopper, cock, hawk, wolf, and olive-tree.

In sculpture, he is generally represented with a face beautifully oval, high forehead, flowing hair, and slender figure. The most famous representation of the god is the Apollo Belvedere at Rome, a figure in which are combined the highest intellect

Apollo Belvedere.

with the most consummate physical beauty. It is supposed to be a copy of a bronze votive statue erected at Delphi, and representing the god repelling the Gauls (279 B.C.) from his shrine. From another copy, a bronze statuette at St Petersburg, known as the Stroganof Apollo, it is found to have been an aegis, not a bow, that the figure held in the left hand. The statue (upwards of 7 feet high) is naked, but a cloak fastened round the neck hangs gracefully over the extended left arm; the expression of the face is one of calm and godlike triumph, mixed with 'beautiful disdain.'

This great work of art was discovered in 1495 amid the ruins of ancient Antium, and purchased by Pope Julius II., who placed it in the Belvedere of the Vatican, whence the name it bears. The left hand and the right fore-arm, wanting in the statue as discovered, were restored by a pupil of Michael Angelo.

Apollodor'us, (1) an Athenian painter, who flourished about 408 B.C., and was the predecessor of Zeuxis. He introduced improved colouring and distribution of light and shade.—(2) An Athenian grammarian who flourished about 140 B.C., wrote a work on mythology, giving an arrangement of old myths from the earliest times to the historical period; also a geography, a chronicle in iambic verse, and several grammatical works. The account of the mythology and the heroic gods of Greece, known as the *Bibliotheca*, is the only work preserved (except a few fragments). It is a valuable work, but is reckoned by some only a later extract from a larger work by Apollodorus. A late edition is Hercher's (Berl. 1874).—(3) Another Apollodorus was a celebrated architect in the time of the Emperor Trajan, by whom he was employed to construct a bridge over the Danube in Lower Hungary. He was sentenced to death in 129 A.D. by Hadrian, offended at his fearless criticism of a temple designed by the emperor himself.

Apollon'ius. (1) APOLLONIUS OF RHODES (born in Alexandria about 240 B.C., but long resident in Rhodes) wrote many works on grammar, and an epic poem entitled the *Argonautica*, marked rather by learning and industry than by poetical genius, though it contains some truly artistic passages, such as those exhibiting the growth of Medea's love. It was greatly admired by the Romans, was translated into Latin by Publius Terentius Varro, and was imitated in a wholesale manner by Valerius Flaccus. There are editions by Merkel (1854) and Seaton (1888).—(2) APOLLONIUS OF PERGA, who flourished 250-220 B.C., is classed with Euclid, Archimedes, and Diophantus, among the founders of the mathematical sciences. His work on conic sections has been preserved, partly in the original Greek, partly in an Arabic translation. He not merely summed up all that was then known on the subject, but made many valuable discoveries.—(3) APOLLONIUS OF TYANA in Cappadocia, born three or four years before the Christian era, was, according to Philostratus, a zealous teacher of the neo-Pythagorean doctrines, who claimed a commission from heaven to teach a pure and reformed religion. He soon collected a considerable number of disciples, travelled through a great part of Asia Minor, and ultimately made his way to India, in order to become acquainted with the doctrine of the Brahmins. On this journey he stayed for a time in Babylon, was introduced to the Magi, and at last reaching the court of King Phraortes, in India, made the acquaintance of the most notable Brahmins. When he returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity, rather than the power of working miracles. He was patronised by Vespasian, and followed him to Egypt. After extensive travels in Spain, Italy, and Greece, he was accused of having conspired with Nerva against Domitian. Ultimately, he appears to have settled in Ephesus, where he opened a neo-Pythagorean school, and continued his teaching until he died, nearly one hundred years old. His history was not written till more than a hundred years after his death, by Philostratus (q.v.). It contains a mass of absurd-

ities and fables, through which an outline of historical facts and the real character of the man are perhaps discernible. After his death, he was worshipped with divine honours, temples were built to him, coins struck in memory of him. The notorious English freethinker Blount, and Voltaire, wrote to prove the similarity or superiority of Apollonius to Christ. Baur's theory is, that Philostratus invented most of the story of Apollonius as a heathen saviour, simply to be a counterpart and rival to Christ. See Froude's *Short Studies* (vol. iv.); and the work by Pettersch (Berl. 1879).—(4) APOLLONIUS, surnamed DYSKOLOS (or 'ill-tempered'), of Alexandria, lived in the 2d century. Some of his grammatical works were edited by Bekker. He was the first who reduced grammar to a system. His reputation was so high, that Priscian calls him *grammaticorum princeps* (the prince of grammarians), and follows him somewhat closely.

Apollo'nus OF TYRE, the hero of a Greek metrical romance, very popular in the middle ages. It relates the romantic adventures of Apollonius, a Syrian prince, as well as those of his wife who was parted from him by apparent death, and his daughter, and closes with the happy reunion of the whole family. The original no longer exists; but there are three very early Latin versions, of which one was published by Welsch (Augsburg, 1595); another is to be found in the *Gesta Romanorum*; and the third in the *Pantheon* of Gottfried of Viterbo. From this Latin source have proceeded the Anglo-Saxon version of the 11th century (ed. by Thorpe, 1834), the Spanish version of the 13th century, and several French and Italian versions in prose and verse of the 14th and 15th centuries. Shakespeare treated the subject in his drama of *Pericles*, mainly following the version of Gower in his *Confessio Amantis*, itself based on the *Pantheon* of Gottfried of Viterbo. The romance was rendered into German, probably from the *Gesta Romanorum*, by a Vienna physician, 'Heinrich von der Neuenstadt,' about the year 1300, in a poem of 20,000 lines. A hitherto unknown Middle German prose version of the story was edited by Schröter in 1872. Simrock narrates the story as it is given in the *Gesta Romanorum*, in his *Quellen des Shakespeare* (Bonn, 1872). See Hagen, *Der Roman vom König Apollonius in seinen verschiedenen Bearbeitungen* (1878).

Apollo's, an Alexandrian Jew, described in the Acts of the Apostles as an eloquent man, and mighty in the Scriptures, knowing only the baptism of John, who on coming to Ephesus (54 A.D.) was more perfectly taught by Aquila and Priscilla. He was a distinguished fellow-labourer of the apostle Paul; and in Corinth was especially successful as a Christian teacher, inasmuch that a party in the church called themselves by his name (1 Cor. iii. 4). By many he has been regarded as the author of the Epistle to the Hebrews.

Apollyon (Gr., 'the destroyer'), or ABADDON (Rev. ix. 11; cf. Job, xxvi. 6, xxxi. 12), the same as the Asmodeus of the Book of Tobit (iii. 8). See ASMODEUS. It is with Apollyon that Christian fights his hardest battle in the *Pilgrim's Progress*, and it is to this literary use of it by Bunyan that the name now mainly owes its currency.

Apologetics (a word derived from Gr. *apo*, 'from,' and *logos*, 'speech'—something *spoken* to ward off an attack) technically connotes that branch of theology which is concerned with the defence of Christianity. It is not to be confounded with *polemics*, which is occupied with the defence of the peculiar doctrines of parties *within* the Christian pale. A work has come down to us, written by Xenophon, entitled the *Apology of Socrates*, and

another, with the same title, by Plato. From these the Christian fathers adopted the term. As a distinct branch of theological science, apologetics cannot be dated further back than the 18th century. Isolated apologies, however, appeared from time to time, from the days of Justin Martyr (d. 168) downwards. Thus, as against the Ebionites and Gnostics (q.v.), were written Justin's two *Apologies* and his *Dialogues*. Against Celsus (q.v.), a philosopher of the 2d century, strove to reduce Christ to the level of the ancient philosophers of Greece. Against him, Eusebius of Cæsarea, Theodoret, and Augustine (q.v.) wrote. In the 4th century, the Emperor Julian, known as the Apostate, endeavoured to rehabilitate paganism in the place of Christianity. He was combated by Cyril of Alexandria, who wrote ten books against him. In mediæval times, various apologetic works were written by Anselm of Canterbury (d. 1109); by Abelard (d. 1142); and by Thomas Aquinas, the *doctor angelicus* (d. 1274).

As a distinct branch of systematic theology, apologetics is treated under two great heads—viz. Natural Theology and Revealed Theology. Proceeding upon the former of these lines, and confining himself entirely to the light of nature, the apologist endeavours to prove the existence of God, and the possibility of knowing Him. He then goes on to prove the existence of the human soul, and the doctrine of a future life. In working out the theistic argument, two methods are adopted—viz. the ontological, or *a priori*, which reasons from cause to effect, from self-evident principles prior, in logical order, to experience, to their application; and the teleological, or *a posteriori*, which, reversing the former process, reasons from effect to cause, from observed facts to a general principle. The *a priori* argument has been variously set forth by Anselm, Descartes, Dr S. Clarke, Cousin, Ferrier, and Gillespie; and the *a posteriori* by a host of writers, among whom may be named Paley, *Natural Theology*; Chalmers, Kidd, Bell, Buckland, &c. in the *Bridgewater Treatises*; Flint, *Baird Lectures*; Conder, *The Basis of Faith*; Janet, *Final Causes*; and various Bampton lecturers. It is now generally admitted that these two arguments cannot be absolutely separated—something from experience enters into the *a priori* argument, and, *vice versa*, an *a priori* element enters into experience. When, however, we gather into a focus all the evidence furnished by causation, order, and intuition, the apologist maintains that the argument for theism is simply irrefragable. To the objection that though the existence of God may be thus proved, we cannot, owing to the relativity of our knowledge, in any true sense *know* Him, the apologist replies that He may be as truly known as any other object, by the contemplation of His attributes as disclosed in His works. The theist does not profess to *comprehend* the Infinite One; all that he asserts is that he is capable of truly *apprehending* Him. His knowledge, as far as it goes, is true knowledge.

The argument for the existence of the soul, and for a future state, is based upon physiology, psychology, and moral government. It is maintained that the closest scrutiny of man's physical organisation leads up to the conclusion that his loftiest endowments—self-consciousness, reason, and conscience—must inhere in a substance other than material. When, again, the data which consciousness furnishes are duly weighed, it is asserted that man's intellectual capacities, his intuitions, and his aspirations clearly intimate that his true environment is the infinite and the eternal. Special stress is laid upon the testimony of conscience.

Man's sense of moral responsibility, it is argued, shows that his present state of existence is manifestly one of discipline and probation. Such a state would, however, be utterly meaningless if, at death, he were to drop into non-existence. See, as against materialism, Lotze, *Microcosmus* (Eng. trans. 1886); and on the argument from moral government, Kant, *Metaphysics of Ethics*; see also Pascal, *Thoughts*; Butler, *The Analogy of Religion*; and the various writers on natural theology. Of works in which assaults on religion from the side of science are met by arguments from the physical sciences, we may mention Sir J. W. Dawson's *Origin of the World* (1877); and Professor Henry Drummond's *Natural Law in the Spiritual World* (1883; 67th thousand, 1887).

In defence of revealed theology, the apologist has been called upon to deal with a wide range of subjects. Since Lessing (q.v.) published the 'Wolfenbüttel Fragments' (now generally ascribed to H. S. Reimarus of Hamburg, who died 1768), that destructive criticism came into vogue which has found such advocates as Strauss and Renan, Kuenen and Wellhausen. Kant's famous *Critique of Pure Reason*, which denies to pure reason the power of making any certain statements concerning what is divine, gave an impetus to the rationalistic tendencies of the Deists (q.v.), the result of which is seen in modern agnosticism and positivism. Under these combined influences, the supernatural has come to be either denied, or ignored as unverifiable. The Bible, in particular, has been subjected to the severest criticism, with a view to the complete undermining of its authority as a witness for God and for a future life. Apologetics has therefore for its task in this field, to defend the canonicity, and to prove the inspiration and consequent trustworthiness of Sacred Scripture. On these topics, see Westcott, *History of the Canon of the New Testament*; Charteris, *Canonicity*; Lee, *The Inspiration of Holy Scripture*; and Ladd, *The Doctrine of Sacred Scripture*. There is a tendency in some quarters at present to distinguish the biblical writings into canonical and deuterocanonical (see Ladd, *ut supra*). As regards *inspiration*, the verbal theory is abandoned by most. Evangelical writers, however, still advocate a theory of *plenary inspiration*; but the theory, as held by them, does not usually exclude the possibility of 'circumstantial errors' occurring in Scripture (cf. Briggs, *Biblical Study*, p. 242). They also distinguish between inspiration and revelation; the current phrase being that the Bible is *the record* of divine revelation.

Modern apologists, however, do not place these topics in the foreground. Their main concern is to establish the moral perfection of the Christ of the gospels, and then the substantial historical character of the evangelical records. If the sinlessness of Christ is conceded, they maintain, with Origen, that 'He is the miracle of the world'—i.e. He is a *moral* miracle. In connection with the appearing of such a Being, they say that it is in the highest degree reasonable to look for manifestations of the supernatural in the *physical* sphere. The one physical miracle on which they are prepared to stake everything is the resurrection. In proof of this event, they push their historical investigations backwards, step by step, through the writings of the early fathers, and specially through the four epistles which the most adverse criticism ascribes to the apostle Paul, until they arrive at within twenty-seven years of the crucifixion. They are then in a position to show that the moral portraiture of Christ which appears in the canonical gospels was at that date extant, and that, moreover, Christian communities founded upon faith in the resurrection of Christ were to be met with from Jerusalem to

Rome. That a 'myth' could have established itself in so short a period, they maintain, is incredible; and as to a hallucination, such as the theory of 'visions' demands, having taken possession of such a multitude of otherwise rational and estimable people—this they regard as palpably absurd. If, then, the moral perfection of Christ and his resurrection are conceded, all is conceded. He was what he claimed to be—the Son of God. On the modern statement of the argument, see Liddon, *The Divinity of Jesus Christ* (1887); Bruce, *The Miraculous Element in the Gospels*; and specially Row, *A Manual of Christian Evidences* (1887). The apologetic works of Luthardt, Christlieb, and Goulet are held in high estimation. See INSPIRATION, MIRACLES.

Ap'ologue, a fable, parable, or short allegorical story, intended to serve as a pleasant vehicle for some moral doctrine. One of the best known apologues is that by Jotham, as given in the Book of Judges (ix. 7-15). Another is that of the 'Belly and the Members,' related by the patrician Menenius Agrippa, in the second book of Livy. The name is applied more particularly to a story in which the actors or speakers are animals or inanimate things. It is identical with the classical *fable*, though it may perhaps be somewhat more complex and sustained than is possible in this form. The New Testament *parable* is a simpler kind of apologue, the incidents of which are necessarily probable. Æsop's fables have enjoyed a world-wide reputation. Luther held such an opinion of the value of the apologue as a vehicle of moral truth, that he edited a revised Æsop, for which he wrote a characteristic preface.

Apomorphia is an alkaloid prepared from morphia by heating with hydrochloric acid. It is a rapid and powerful emetic, but its effects quickly pass off; and it causes very little depression. Its chief value depends upon the ease with which it can be administered by hypodermic injection (q.v.), as vomiting can thus be induced even when swallowing is difficult or impossible—e.g. in cases of poisoning.

Aponeuro'sis (Gr. *apo*, 'from,' and *neuron*, 'a string') is an anatomical term for an expansion of strong fibrous tissue, of which there are many examples in the human body. It is generally confined to expansions from the tendons of muscles, as the lumbar aponeurosis. If a tendon is very broad and expanded, as that of the external oblique muscle of the abdomen, it is said to be aponeurotic. Some muscles, as those on the shoulder-blade, are partially covered with a tendinous expansion, to which some of their fibres are attached. Aponeuroses stretch in some places as protections over large arteries.

Ap'ophthegm, a terse, pithy saying, conveying some important truth in a few words. The apophthegm is more short, pointed, and practical than the Aphorism (q.v.) need be, and is intended to make a vivid impression on the hearer. Examples are—'God helps them that help themselves;' Dr Johnson's 'Patriotism is the last refuge of a scoundrel.' Apophthegm is also spelt APOTHEGM.

Apoplexy (Gr. *apoplēxia*—from *plēssō*, 'I strike'—'disablement from a stroke'), a term used in medicine, from early times, of any sudden and unaccountable loss of consciousness, and still popularly employed in much the same way. It is generally applied, however, by modern medical writers to rupture of a blood-vessel, with hemorrhage in the brain or its membranes, whether with or without unconsciousness. This sense will be adhered to in the following description. Most unfortunately, it has also been used of hemorrhages into the tissue of any organ in the body—e.g. *pulmonary apoplexy*.

In consequence of these ambiguities, there is at present a tendency to abandon the word in favour of more precise terms.

Apoplexy is commonly a disease of advanced life, being very rarely met with below the age of forty. The most important causes which predispose to apoplexy are Atheroma and minute Aneurisms (q.v.) in the brain (see ARTERIES, *Diseases of*), and chronic Bright's Disease (q.v.). At one time much more importance was attached than now to a thick-set, short-necked habit of body in this connection. Men are more liable to apoplexy than women. A severe *apoplectic fit* or *shock* may come on suddenly or gradually; in either case the patient loses sensation, motion, and consciousness, and lies with flushed face, full slow pulse, and noisy 'stertorous' breathing. If death occur, a clot of blood may be found in the substance or upon the surface of the brain, with the ruptured artery from which it has escaped. If the shock be not fatal, the patient gradually recovers consciousness; and it is found then, if not before, that there is Paralysis (q.v.), partial or complete, of one side of the body. In the course of days or weeks this may pass off; but rarely disappears completely. Mental enfeeblement, as well as bodily, may result. Less severe shocks of apoplexy often occur, with no unconsciousness, but only paralysis, partial or complete, of one side of the body. The approach of apoplexy is often heralded by *premonitory symptoms*—e.g. temporary confusion of thought or loss of memory, giddiness, headache, difficulty of speech, weakness in a limb, double vision; and when these occur, prompt medical treatment, especially attention to regular action of the bowels, may occasionally avert the threatened apoplexy. When a shock of apoplexy has occurred, the patient must be kept lying perfectly quiet, with head raised, and cold applied to it. Medicines which tend to check hemorrhage, as ergot, should be administered. Purgatives may be given; and bleeding, especially from the temporal artery or external jugular vein, is sometimes valuable. Alcohol is dangerous, and should on no account be used unless by express direction of a medical man. A person who has had one shock of apoplexy is always liable to a recurrence.

Embolism of the cerebral arteries (see ARTERIES, *Diseases of*) closely resembles apoplexy; as do fits, called *apoplecticiform attacks*, met with in other brain diseases—e.g. tumours, general paralysis. The condition of a patient suffering from Epilepsy (q.v.), uræmia (see KIDNEYS, *Diseases of*), or narcotic poisoning—e.g. by opium or alcohol—may be very like that described as characteristic of apoplectic unconsciousness, and very difficult to distinguish from it. Hence the great importance of caution in dealing with a person found unconscious, lest he be treated, to his imminent peril, as merely drunk, when really suffering from severe apoplexy.

Heat-Apoplexy is another name for Sunstroke (q.v.).

Apos'pory. See FERN, REPRODUCTION.

Apostate literally designates any one who changes his religion, whatever may be his motive; but, by custom, the word is always used in an injurious sense, as equivalent to one who, in changing his creed, is actuated by unworthy motives. In early Christian times, the word was applied to those who abandoned their faith in order to escape from persecution; but it was also applied to such as rejected Christianity on speculative grounds (the Emperor Julian, for instance). The apostates in times of persecution were styled variously *Sacrificati*, *Thurificati*, &c., according to the modes in which they publicly

made known their return to heathenism, by offering sacrifices or incense to the gods of Rome. Controversies arose in the early church as to the readmission of those who had so lapsed (see LAPSED and NOVATIAN). The Roman Catholic Church at one period imposed severe penalties on apostasy. The apostate was naturally excommunicated; but sometimes also his property was confiscated, and he himself banished, or even put to death. The term is also applied, not only to those who become perverts to Mohammedanism, usually called *renegades*, but to such as exchange the Roman Catholic for the Protestant faith, and *vice versa*. It has often had great influence on the fortunes of a nation that a prince has apostatised. The most renowned instance in modern history is that of Henry IV. (q.v.), who became a Roman Catholic for peace's sake.

A posteriori reasoning is reasoning from experience, or *backwards* from effect to cause. See A PRIORI.

Apostle (Gr. *apostolos*, 'one sent forth'), a messenger, but especially used to denote the twelve disciples whom Jesus sent forth to preach the gospel—twelve probably because there were twelve tribes. Their names were Simon Peter, Andrew, John (the son of Zebedee), James (his brother), Philip, Bartholomew, Thomas, Matthew (identified with Levi), James (the son of Alphaeus), Thaddeus, Simon, and Judas Iscariot. (The lists in Matt. x., Mark iii., Luke vi., and Acts i., are the same, with the exception that for Thaddeus in Matthew and Mark, we have Judas in Luke and Acts.) Peter and Andrew and James and John have a certain pre-eminence; and Peter and the two sons of Zebedee enjoyed a special measure of their master's love and confidence. The apostles were mainly men of very humble rank, distinguished rather by their character and religious zeal, than by intellectual ability or special training. Subsequently, Matthias was chosen in the room of Judas; and still later, Paul was called to the apostleship. The apostles were twice commissioned to go forth on their work of evangelisation; first during the Galilean ministry, when their labours were restricted to the Jews. The second time was shortly before the Lord's ascension, when they were sent to 'teach all nations, baptising them in the name of the Father, and of the Son, and of the Holy Ghost.' On the day of Pentecost, the apostles received miraculous gifts. It has been held that it was as essential to their office that they should have seen the Lord (1 Cor. xv. 8); that they were inspired (John xvi. 13; Gal. i. 11, 12); and that they had the power of working miracles (2 Cor. xii. 12). Scripture tells nothing about the later life or labours of most of them, and there is no historical foundation for the tradition that the first apostles divided the then known world between them, and that all save St John died a martyr's death. Early tradition, however, connects Philip with Phrygia, Thomas with Parthia, Andrew with Scythia, Bartholomew with India. When controversy arose about the relation of the church to the heathen world, Paul 'the apostle of the Gentiles,' spoke of the office of Peter, as 'the apostleship of the circumcision' (Gal. ii. 7-9). The church did not maintain the office of apostle in its ministry, though it has been contended that the office of the Bishop (q.v.) represents it. The see of Rome calls itself apostolic, as having been occupied by St Peter. The Catholic Apostolic Church has revived the title of apostle. It is also usual to speak of the founder of the Christian Church in a country as the apostle of that country; thus, Gregory is the apostle of Armenia; Boniface, of the Germans; Augustine,

of the English; St Patrick, of Ireland; Columba, of the Scots; Cuthbert, of Northumbria; St Francis Xavier, of India; and, more recently, Eliot is spoken of as the apostle of the Indians.

Apostles, TEACHING OF THE TWELVE, is the title of a treatise discovered in 1883 by Bryennius, the metropolitan of Nicomedia, and published by him with a Greek commentary (Constantinople, 1883). In sixteen short chapters it describes the two ways of life and of death, the method of divine service, baptism, fasting, prayer, the eucharist, and the ministry in the early church. The ministers are distinguished as permanent or itinerant, bishops and deacons belonging to the former, and prophets and teachers to the latter class. It had previously been suggested that some such document must underlie the seventh book of the *Apostolic Constitutions* (q.v.); and there is certainly a very close connection between this and the eighth book and the treatise. The work is moral rather than dogmatical in tone, and is of great interest for the history of the early Christian Church; but it throws no fresh light on the New Testament canon, and does nothing to settle the Johannine origin of the fourth gospel. The writer borrows extensively from the *Epistle of Barnabas*, 119 A.D.; and Harnack accepts Taylor's view that the book, or at least the first part of it, is based on a Jewish manual called *The Two Ways*, introduced at a very early date into the Christian Church for the use of catechumens. The date of the treatise is uncertain; some scholars fix it at 80-100 A.D.; Harnack contends for 120-165; and one hostile critic places it after the *Constitutions*. English translations include those by Farrar, Spence, and Schaff; within five years of the publication of the original, as many as 200 treatises, books, and articles on it had appeared. Very valuable notes will be found in Harnack's *Lehre der Zwölf Apostel* (1885); see also his *Apostellehre* (1887). The work is frequently referred to as the *Didachê* (Gr., 'teaching'). In 1887 the Johns Hopkins University of Baltimore produced a fac-simile of the original.

Apostles' Creed. See CREED.

Apostle Spoons, silver spoons whose handles ended in figures of the apostles, a common baptismal present in the 16th and 17th centuries.

Apostolic, or APOSTOLICAL, the general term applied to everything derived directly from the apostles, or bearing their character. Either case constitutes apostolicity. The Roman Catholic Church declares itself the Apostolic Church, and the papal chair the apostolic chair, on the ground of an unbroken series of Roman bishops from the chief apostle, Peter. The Church of England, in virtue of regular episcopal ordination from the pre-reformation church, claims to be apostolic; so likewise do the Protestant Episcopal Churches in Scotland and the United States. Apostolic Tradition claims to have been handed down from the apostles themselves. In the same special sense, the name of Apostolic Council belongs to the conclave of the apostles at Jerusalem (Acts, xv.), about the year 50 A.D. Certain congregations or churches, also, which were the special scenes of the labours of the apostles, bore this title for centuries, more especially those of Jerusalem, Antioch, Alexandria, and Rome. But with the ever-increasing spiritual power of the Romish hierarchy, the name came to be more and more exclusively applied to Rome. Hence the term Apostolic See—i.e. the see of Rome; Apostolic Blessing, the blessing of the pope as the successor of St Peter; Apostolic Vicar, the cardinal who represents the pope in extraordinary missions; Apostolic Chamber, a council intrusted with the care of the revenues of the see of Rome. Apostolic Majesty is a title

conferred by the pope on Stephen, the first king of Hungary, and still retained by the emperor of Austria as his successor. A papal brief or letter is styled apostolic in the same sense.—**APOSTOLICITY**, a term employed to denote that a church possesses the teaching of the apostles. The Roman Catholics use the term as expressing their claim that their church was founded by St Peter.

Apostolical Succession is a phrase used to denote one or both of *two* things—the derivation of holy orders by an unbroken chain of transmission from the apostles, and the succession of a ministry so ordained to the powers and privileges of the apostles. The theory of the Catholic Church is that its present bishops have the right to ordain in virtue of being the representatives of the apostles, who in their turn represented the Lord himself, the fountain of all grace; and further, that the Lord committed this right or power to his apostles only, that it might be transmitted to all future ages of the church through them, next through bishops ordained by them, then by their successors in regular order. The scriptural argument is mainly based on such passages as Matt. xviii. 18. Opponents of this theory maintain that these words of institution had no such special significance; that, moreover, history shows that God did not take means to preserve such a succession in his church, for it was not till the 4th century that the church officers became a separate class, and in early stages of its history, laymen, as well as church officials, could teach or preach, baptise, celebrate the eucharist, exercise discipline, and perform all special functions now considered valid only if performed by a priest ordained by a bishop in regular succession. They maintain, moreover, that ordination meant merely appointment or admission to office, that no writer of the first two centuries either states or implies that those ordained had any exclusive powers, and that the facility with which ordinations were made and unmade strengthens this inference. The rite now considered essential—the laying on of hands—in ancient times was not universal, and therefore could not have been a necessary element in ordination, being regarded merely as a symbol or accompaniment of prayer, without any special significance. See **BISHOP, ORDERS, PRIEST**; and on the destructive side of the argument, Hatch's able work, *The Organisation of the Early Christian Churches* (the Bampton Lectures for 1880). See also the Dissertation on 'The Christian Ministry' in Lightfoot's edition of St Paul's *Epistle to the Philippians* (1868), where it is proved that though the episcopate was developed within the last thirty years of the first century, and cannot be dissociated without violence to historical testimony from the name of St John, yet the power of the bishops was at first merely a question of practical convenience, entirely unconnected with sacerdotalism, which was not implied in the term 'clerus,' either by Clement, Ignatius, Polycarp, Justin Martyr, Irenæus, or any father until Tertullian, and even by the latter was qualified by his assertion of an universal priesthood in believers. Lightfoot proves that sacerdotal views were due to Gentile influences, but found support in Old Testament analogies, and that Cyprian was the first to make those sacerdotal assumptions for the clergy which have since become so prevalent within the Catholic Church.

Apostolical Brethren, the name given in Italy, towards the end of the 13th century, to a sect which opposed the worldly tendencies of the church. Its founder was Segarelli, a weaver in Parma, who went about Italy preaching repentance and the need of a return to the mode of life of the apostles, including the primitive community

of goods. After twenty years of undisturbed activity and growing influence, the movement was condemned by popes Honorius IV. and Nicholas IV., and, in 1300, Segarelli perished at the stake, with many others, both men and women. Dolcino, a more energetic and cultivated man, now headed the orphan sect, and fortified a mountain near Vercelli; but after a gallant defence, compelled by famine to submit, he was tortured, and burned at the stake (1307).—A Gnostic sect of the 3d century took the same name; as also a body of persons near Cologne in the 12th century.

Apostolic Constitutions and Canons, both ascribed by tradition to Clemens Romanus, are notes of ecclesiastical customs held to be apostolical, written in the form of apostolic precepts. The *Constitutiones Apostolicæ*, consisting of eight books, were probably composed in Syria, and contain, in the first six books, a comprehensive rule for the whole Christian life. These were probably written about the end of the 3d century; while the seventh book, which, with the eighth, is thought to have been founded on the recently discovered *Teaching of the Twelve Apostles* (see above), may have belonged to the beginning of the 4th century. The eighth book was put together in the middle of the 4th century, for the use of priests, and relates only to the sacred offices. Interpolations, however, were afterwards introduced. The *Canones Apostolici*, which were also recognised by the church, were composed at a later period. The first fifty, compiled in the middle of the 5th century, and translated from Greek into Latin by Dionysius the Younger, were alone acknowledged by the Latin Church. The Greek Church, on the other hand, accepted the thirty-five canons put forth in the beginning of the 6th century; and this became a point of discord between the churches. Both collections were probably looked upon at first as apostolic traditions merely, but later came to be looked upon as due to the apostles themselves. See Bunsen's *Hippolytus*.

Apostolic Fathers, the name given to the immediate disciples and fellow-labourers of the apostles, and, in a more restricted sense, to those among them who have left writings behind them. Those specially so called are Barnabas, Clement of Rome, Ignatius, Hermas, and Polycarp. Papias of Hierapolis is also included by Irenæus, but this is probably an error. The writings of the apostolic fathers, as to their form and subject, may be looked upon as a continuation of the apostolic epistles, though far inferior to them in spirit. Their main purpose is to exhort to faith and holiness before Christ's coming again.—Editions of the apostolic fathers were published by Cotelierius (Par. 1672), Jacobson (Oxford, 1838), Hefele (1839), and Dressel (1857); another by Gebhart, Zahn, and Harnack appeared in 1875-78 (3 vols.). There are several English translations, including one in Clark's *Ante-Nicene Library*. See Donaldson's *Apostolic Fathers* (1874). Standard editions of individual fathers are Bishop Lightfoot's exhaustive commentaries on the Clementine and Ignatian epistles. See **FATHERS OF THE CHURCH**, and the articles on each name.

Apostrophe (Gr. *apostrophē*, 'a turning away,' or 'breaking off') is a rhetorical figure by which a speaker changes the course of his speech, and addresses, with greater or less emotional emphasis, persons present or absent, the dead, or inanimate objects, either to invoke them as witnesses, or to pity, praise, or blame them. Quintilian explained it as directed to a person present, but modern use has extended it to the absent or dead, who are for the time being supposed to be present. When the figure is well managed, it has a thrilling effect,

both in oratory and poetry; but when extravagantly introduced, it becomes ludicrous. Examples of it abound in the writings and speeches of the great poets and statesmen both of ancient and modern times.—**APOSTROPHE** in Grammar, is the sign (') used to indicate the omission of a letter or letters in a word, as in *o'er, thro', can't*; and as a sign of the modern English genitive or possessive case, as in *boy's, boys', men's, conscience', Moses'*. In the latter case, it marked originally merely the dropping of the letter *e* in writing, as in *fox's, James's*, and was equally common in the nominative plural. Gradually the latter use was dropped, and it was extended to all possessives, even where *e* had not been dropped, as in *man's, children's, conscience' sake*. This usage, as Dr Murray points out, was not yet established in 1725.

Apothecary, the name formerly given in England and Ireland to members of an inferior branch of the medical profession. The apothecary was in England a licentiate of the Apothecaries' Society of London; in Ireland, a licentiate of the Apothecaries' Hall of Ireland. Up to a comparatively recent period, however, no inconsiderable proportion of those who practised as apothecaries, at anyrate in England, were persons practising without any license. The licensed apothecary frequently kept a shop in which he sold drugs and made up medical prescriptions, in this respect competing with the chemist and druggist. But he was entitled to attend sick persons, and prescribe for them; and though it was the almost universal practice of apothecaries to charge their patients only for medicines supplied, they had the alternative of charging for their attendances, but could not charge for both. The term apothecary has been long in disuse, though, no doubt, it is still a legal description for licentiates of the Apothecaries' Society of London, or of the Apothecaries' Hall of Ireland; and such licentiates are now, as licentiates in medicine before the law, on a par with the graduates of universities.

Anciently, the apothecaries were not distinguishable from the grocers (the surgeons being, in like manner, undistinguishable from the barbers); and it was not till 1617, in the 13th year of James I., that these bodies were formed into two distinct corporations. A statute of 1815 enacted that no person should practise as an apothecary, or act as an assistant to an apothecary, in any part of England or Wales, unless he had been examined by a court of examiners, and had received therefrom a certificate; and any person practising without such certificate was disabled from recovering his charges, and for every such offence was, moreover, rendered liable to a penalty of £20. An act of 1874 amended the act of 1815, and gave the Apothecaries' Society power to co-operate with other medical licensing bodies in granting licenses.

In Scotland, there never was a class of practitioners corresponding to the English apothecaries. See **CHEMISTS AND DRUGGISTS**.

Apothe'cia. See **LICHENS**.

Apotheosis (pronounced formerly *Apothe'osis*, now *Apotheo'sis*; from Gr. *theos*, 'a god'), deification, or the raising of a mortal to the rank of a god. It is a process quite consistent with primitive philosophy, as it is only a particular case of spirit-worship and of ancestor-worship—a special application of the animistic principle. The belief in the immortality of the dead is at once its cause and the condition of its being granted. As the logical corollary to the worship of ancestors, it has been an important factor in religions, though the simplicity of its origin has often been obscured by the accretions of the mythical. The honours paid

to the Chinese philosopher Confucius—the principal part for more than two thousand years of the religion of the educated in the Celestial Empire—present the only example of a pure apotheosis, without any admixture of mythological elements. The process is still seen going on among many Indian tribes, as in the case in South India of that departed English officer who continues, as in life, to be appeased with offerings of cheroots and brandy. Apotheosis has had greater influence on political order than on religious conceptions. It has been the instrument of theocracy and of monarchy, the foundation of the divine right of kings. Born of the worship of the dead, it rapidly degenerated into the adoration of the living. Once the survival of the soul was admitted, nothing appeared more natural than to anticipate its future divinity.

Over all the world, sorcerers, chiefs, kings, and conquerors have turned to account this logical consequence of animism. The Peruvian of Pizarro's time, the Chinese, the Japanese, have their sacred kings, sons of the sun or moon. In Egypt, the Pharaohs and the Ptolemies took their place at the same moment on the throne and on the altar. Lysander, the conqueror of Athens, was worshipped in Asia Minor; Alexander declared himself the son of Ammon, and insisted at last on the same honours as were due to his divine parent. At Rome, the apotheosis of the Æneas of fable, and of the legendary Romulus, was but the prelude to that of Cæsar. Augustus in his turn became a god; while declining the adulations of the senate, he let himself be deified everywhere except at Rome. In every kingdom temples sprang from the ground, and colleges of priests were instituted for the service of the new deity, whose praises were chanted in unison by Virgil, Horace, and Ovid. Nor was sincerity wanting to that enthusiasm. At the end of frightful civil wars, the world hailed the era of peace. Augustus was quick to see the political advantage of this universal idolatry. It linked the whole empire together, the sacred person of the emperor becoming the guarantee for all its institutions. The cult was assiduously spread, and when once it was linked to the fundamental worship of mankind, that of ancestors, manes, lares—the most tenacious form of animism, particularly dear to the Romans—it proved too strong even to be weakened by the vices and folly of a Caligula or a Nero, or the outrage of an imperial decree requiring divine worship also for a Poppæa or an Antinous. An analogy has been pointed out between apotheosis and the canonisation decreed by Christian pontiffs; and traces of the Roman usage survive in the inveterate notion in the monarchies that grew out of the ruins of the old Roman empire, of the 'divinity that doth hedge a king.' It was not alone in the 'Holy Roman Empire,' which claimed for itself the proud descent of the old Roman power, that this special sanctity was supposed to exist; but by a kind of partial apotheosis it was connected with every head that wore a crown, by none with more perverse and fatal tenacity than some of the least godlike of our English kings.

Appalachians, a great mountain-system of North America, nearly parallel with the Atlantic coast, and extending from the Gulf of St Lawrence SSW. to the west central portion of Alabama. Geologically, it is much older than the Western Cordillera, known as the Rocky Mountain system, but it is in the main much later in geologic date than the Laurentide system, which represents it on the north of the St Lawrence. It is the parent of many of the rivers of the Atlantic States; but

Company.

several large streams break its continuity; and one, the river Hudson, is a tidal channel which carries even sea-going vessels through the range, a phenomenon very unusual in any part of the world. The Appalachians consist, in the main, of various parallel ranges, separated by wide valleys. Even the low hill-ranges between the mountains and the sea have much of the same parallelism, and the sea-coast has in a marked degree the same general direction and curvature as the mountains themselves; while, far to the NE., the nearly detached peninsula of Nova Scotia and the island of Newfoundland are traversed by ranges exhibiting the same parallelism and the same general direction as are seen in the Appalachian ranges. In no mountain-system do we find better illustrations of the celebrated theory of the late H. D. Rogers concerning the process of mountain formation than in this. The wave-like structure is regarded as due to pulsations in the fluid matter beneath the earth's crust, propagated in great waves of translation from vast ruptures due to the tension of elastic matter. The shape of the ridges, the plications of the strata, and the final direction of the flexures, are regarded as results of a combined undulating and tangential movement. During this movement rents occurred along some of the bendings, out of which dykes and veins of igneous matter were poured. In short, a great earthquake, or succession of earthquakes, here occurred, during which the earth's crust received much of that corrugation of surface which these mountains at present exhibit. At the same time the oscillations of the crust seem to have actually thrown forward or floated the earth's crust along the surface of the fiery sea on which it rested.

Locally, the Appalachians have various names. In the Gaspé Peninsula we find the Shickashock Mountains, and then the White Hills, and the Franconia Mountains of New Hampshire, where Mount Washington attains the height of 6293 feet. In the Green Mountains of Vermont, the disposition of the mountains into parallel chains becomes apparent. In Massachusetts, the main ridge is locally called the Hoosic Range, and the more westward ridge is the Taghkanic. To the east of the Hudson lie the Highlands; on the west side of the river are the Catskills, Shawangunk Mountains, and other groups, with only local exemplifications of parallelism. In Pennsylvania, the mountain-ridges are long, and are marked by a singular evenness of their tops, there being few noteworthy peaks, but many gaps for the transmission of streams. Still farther to the SW. the flat mountain-tops often become wide treeless plains, densely covered with grass, and having a soil sometimes rich, but often heavy and wet. In some instances, however, these narrow plateaus are singularly dry and barren. The valleys between the ridges have sometimes an extremely fertile soil, resting upon cavernous limestone, with beds of valuable iron ore; but some of the valleys have a lean slaty soil. In Pennsylvania and Maryland, the most seaward of the important ridges is the South Mountain or Blue Ridge, which is regarded as identical with the Unaka or Smoky Mountain Ridge of North Carolina and Tennessee; what is called the Blue Ridge of North Carolina being a nearly parallel eastern chain, which in the SW. part of Virginia coalesces with the Blue Ridge proper. West of the South Mountain of Pennsylvania comes the great Alleghany Ridge, which often gives name to the whole system. It is much more remarkable for its uniformity and flatness of top, and for the absence of breaks, than the South Mountain or Blue Ridge. In the great valley between the two main crests are several minor parallel ridges, and

the same feature is apparent in the elevated region which is bounded eastward by the main Alleghany. The great Cumberland Mountain plateau of Kentucky and Tennessee may be taken as the SW. representative of the Alleghanies proper. Crossing Tennessee, the western parts of the Carolinas, and the NW. of Georgia, the system terminates in the broken hilly plateau of Central Alabama.

Nowhere do the Appalachians reach the snow-line. Their highest points occur in North Carolina, where Mitchell's Peak reaches the height of 6688 feet. The Appalachians must have been, in the main, developed after the Carboniferous, and before the Jurassic period, although the material of the NE. part of the range is largely referable to a very much more remote age—viz. the Huronian, or perhaps even the Laurentian age. Whatever strata more recent than these may have once helped to form the mountains of New England, they have been to a great extent removed by glacial or other erosive processes.

The principal coal-beds of this chain occur in Pennsylvania to the NNE., and in the other states southward along the mountains to their termination in Alabama, the chief coal-basins being either among the mountains, or to the westward of them. There are beds of anthracite coal on the eastern slopes of the Appalachians, chiefly in Pennsylvania, west of which the coal becomes bituminous, after we have crossed basins of semi-anthracitic and moderately bituminous coal. This coal region is one of the most productive, extensive, and important anywhere known. Of the metals, by far the most important is iron, of which various ores of magnetic, hematitic, and fossiliferous character occur very extensively, and are largely wrought. Gold occurs chiefly to the eastward of the mountains, and is wrought at various points from Virginia to Alabama. Zinc, lead, and other metals are found in this range, which also affords marbles and other limestones, slates, and a great variety of building-stones.

Appalachicola, a river of the United States, rising in Georgia, and flowing through Florida into a bay of the same name, in the Gulf of Mexico. Reckoning from its remotest sources, the headwaters of the Chattahoochee, the Appalachicola is about 400 miles long, being navigable for boats throughout nearly its entire course, and for steam-boats up to the junction of the Chattahoochee with the Flint, when the name of Appalachicola is applied to the stream, a stretch of about 70 miles.—APPALACHICOLA is also a seaport at the mouth of the stream above mentioned. Here is shipped the produce of the river-basin, consisting chiefly of large quantities of cotton.

Ap'panage is not an English legal term, but is a technical word in the French law, in which system it signifies the assignment or conveyance by the crown of lands and feudal rights to the princes of the royal family, that they may be enabled to maintain themselves according to their rank. This was done in France from the time of the early Capets to the Revolution, and the importance it gave to the princes accounts for much in the history of France. The word is also applied to the patrimony of the Prince and Steward of Scotland, which 'has been long erected into a regality jurisdiction, called the principality. The prince has, or may have, his own chancery, from which his writs issue, and may have his own chamberlain and other officers, for receiving and managing his revenue.' In England, the duchy of Cornwall (q.v.), originally granted by parliamentary charter to the Black Prince, may be said to be an appanage of the Prince of Wales, in whose person also, since the junction of the two kingdoms

under the same crown, now merge the rights of the Prince of Scotland. In all these cases, the appanage would probably revert to the crown on failure of lineal heirs-male. In Great Britain, further provision for the maintenance of the royal princes is made by the grant of annuities by parliament.

Apparent. This term is used to express a number of important distinctions, especially in astronomy. The *apparent magnitude* of a heavenly body is the angle formed by two lines drawn from the ends of its diameter to the spectator's eye; this obviously depends upon the distance of the body, as well as upon its real magnitude. A planet seen from the surface of the earth seems lower than if seen from the centre of the earth—the former is its *apparent altitude*, the latter its real. *Apparent noon* is when the sun is on the meridian; true or mean noon is the time when the sun would be on the meridian if his motion in the heavens were uniform and parallel to the equator (see EQUATION OF TIME). The daily and annual motions of the sun in the heavens are both *apparent motions*, caused by two real motions of the earth.

Apparitions. The belief that the spirits of the departed are occasionally presented to the sight of the living, has existed in all ages and countries, and usually declines only when a people has advanced considerably in the knowledge of physical conditions and laws. We can understand the inability of the primitive man and the savage to realise death. The memory of the deceased lends power to call up his appearance. The primitive man does not observe accurately the distinction between fact and fancy—between what is seen in dream and what is seen in reality. Tylor, in his *Researches into the Early History of Mankind*, says: 'The belief that man has a soul capable of existing apart from the body it belongs to, and continuing to live, for a time at least, after that body is dead and buried, fits perfectly in such a mind with the fact that the shadowy forms of men and women do appear to others, when the men and women themselves are at a distance, and after they are dead. We call these apparitions dreams or phantasms, according as the person to whom they appear is asleep or awake; and when we hear of their occurrence in ordinary life, set them down as subjective processes of the mind. Among the less civilised races, the separation of subjective and objective impressions, which in this, as in several other matters, makes the most important difference between the educated man and the savage, is much less fully carried out.' The Dyaks regard dreams as actual occurrences; and many savage races believe that dreams are incidents which happen to the spirit when it is wandering from the body. In sleep, the soul is supposed to leave the body and travel about. If so, why may it not be encountered by some one? The man who fancies he sees at night the figure of a friend, or of an enemy, supposes he sees this dreamer's wandering soul. Among primitive races there is a superstitious objection to rousing a sleeper, lest he should awake before his soul has had time to return to the body. Death is regarded as another form of sleep; and during that sleep the spirit is wandering, and when wandering, may be met. The relative thinks of his deceased kinsman, dreams of him, and supposes he has seen his spirit. Madge Wildfire, in her rambling talk of her dead baby, expresses this confusion of mind between objective and subjective vision: 'Whiles I think my puir bairn's dead—ye ken very weel it's buried—but that signifies naething. I have had it on my knees a hundred times, and a hundred till that, since it was buried

—and how could that be were it dead, ye ken—it's merely impossible.'

One of the modern theories of the natural origin of religion is, that it comes altogether from belief in the reappearance of the dead, and is, in fact, the cult of the ghosts of ancestors. Witchcraft, necromancy, has always been intimately connected with the spirits of the dead, and this is regarded as the parent of all religious worship. The savage man fears the dead and seeks to propitiate them, and gradually forgets that the ghosts are those of ancestors, and considers them as demons, a separate order of spirits; and later, as he advances in intelligence, these demons cease to be altogether demoniacal, and become gods. Be that as it may, it is certain that the propitiation and even worship of the dead has formed an integral part of all primitive religions, and has maintained its hold among the more ignorant after it has ceased to affect the more educated.

A diseased condition of the body, pressure on the brain, produces optical delusion. The writer of this article remembers distinctly how, as a child, he was seated on the box of a coach on a burning summer day, on his way over the great stony plain about Marseilles, when he saw hideous objects, as imps and demons, running by the horses, and vaulting on their backs. He spoke to his father about them, and was at once removed within the carriage, where, away from the sun on his head, the sight of the imps gradually failed. On another occasion, when suffering from inflammation of the lungs, lying with his eyes open, he believed he could see through the back of his head and bed, and watch a group of persons engaged brewing the elixir of life at a fire. The apparitions seen in *delirium tremens* belong to the same category.

The brain consists of two hemispheres, and this enables a double current of ideas to flow through the mind simultaneously; for instance, it is quite possible to read a book aloud, and all the while to be thinking about something else. Attention consists in the uniting and concentrating the thought of both hemispheres, and as one eye controls the observations of the other, and completes it, so is it in the two hemispheres of the brain; the one checks and complements the other. Now, in certain conditions easily induced, when the mind is not on the alert and braced to attention, it is possible for one hemisphere of the brain to receive an impression and form a subjective picture of a person or object independently of the other, and unless the attention be at once aroused, and this picture be critically investigated, this waking dream of one part of the brain may be taken to have been an actual sight of what was really presented to it.

It is, moreover, curious to observe how easy it is for a perfectly sincere and upright person to deceive himself as to what he has seen, simply from the fact that he has not been attentive, and has not observed critically what has presented itself before him, and he readily falls into the error of accepting a subjective perception for an objective vision. He may have a little doubt at first, but after he has once spoken of what he has seen, all doubt fades away. His spoken account of what he saw gives consistency to the shadowy sight, and without an intention to deceive, he deceives himself as well as others.

The fear of seeing something often so dazzles and bewilders the visual organ, that it sees the things that were feared. This accounts for many stories of the sight of apparitions in haunted houses. A crime is supposed to have been committed in some old house, and superstition believes that the spirit of the murderer or of the murdered person cannot rest. Whoever is nervous and timid, and visits this

house at night, is predisposed to see the wandering spirit, and the fear that is present deprives the judgment of its power of taking accurate observations of what really is seen, and so superinduces a lax condition which is ready to be deceived. There may be conditions of body which allow of a sight beyond what is given to most, as it is certain that beasts see and scent and hear what our own faculties fail to perceive. But what we insist on is, that the greatest caution should be exercised in receiving stories of apparitions, and the utmost care taken to investigate every case of apparent spiritual manifestation. Before we can admit that there are genuine cases of ghosts having been seen, we must be satisfied that the observer was in full possession of his faculties, that his attention was on the alert, that he was capable of judging between subjective and objective presentments, and that he was in a healthy condition of mind and body.

In 1882 a Society for Psychical Research was founded for the scientific and systematic investigation of reported apparitions, clairvoyance, haunted houses, hypnotism, thought-reading, and the phenomena called spiritualistic; and it publishes its Proceedings. Compare with the present article those in this work on ANIMAL MAGNETISM and SOMNAMBULISM; also HALLUCINATIONS.

Among the most famous stories of apparitions, we may mention that told by Cicero of the murdered man appearing to his friend and warning him where to find him in a hay-cart; the apparition of Julius Caesar before the battle of Philippi; that which appeared to Lord Erskine; the famous story of the Earl of Tyrone and the black ribbon, which, however, has been shown by a writer in *Notes and Queries* to be full of discrepancies; the appearance of Sir George Villiers before the murder of his son, the Duke of Buckingham; the case of Sir Charles Lee's daughter (1682); the trains of phantasms that appeared to the publisher Nicolai in Berlin (1791); and the Wynyard ghost story. According to widespread superstition, the apparitions of those about to die in the ensuing year are seen to enter the parish church on St Mark's eve. The most famous account of such a weird procession is that given by Gervase Hollis, reprinted in Chambers's *Book of Days*, i. 549.

Apparitions may be variously classed. There are the *revenants* proper, the ghosts of the dead which reappear, return to walk the earth; the *fetches*, *doubles*, or the second-self, in which case it is the 'counterfeit presentment' of one still living; the *Poltergeist*, a noisy imphish spirit, who amuses himself with upsetting everything in a house, throwing stones, and making unearthly noises. There are also *spectral animals* said to haunt buildings, churchyards, &c. It has been recently shown by the Rev. S. Baring-Gould (*Murray's Magazine*, vol. i. p. 363) that these are reminiscences of animals formerly immured alive under foundations. Appearances of strange lights, and the hearing of mysterious sounds, all belong to the same group of spiritual manifestations. The *Banshee* (q.v.) has its analogues elsewhere than in Ireland, and is held to be an attendant spirit on a family, that appears before the death of a member of it.

The literature on apparitions is voluminous; we can only notice a few of the most important writers on them. Sir David Brewster, in his *Natural Magic* (1832), contended for the rational and natural explanation of the spectral illusions. Before that, an admirable book by Hennings, *Von Geistern u. Geistersehern* (1780), laid the basis of true criticism on spectral appearances. Dr J. Kerner, in his *Magikon* (5 vols. 1840-53), collected the best authenticated stories of ghosts, which he explained

by animal magnetism. Mrs Crowe, *The Night-side of Nature* (1853), followed in the same line. Collections of what purport to be well-authenticated stories of apparitions are Dr Lee's books: *The Other World, or Glimpses of the Supernatural* (1875), *More Glimpses of the World Unseen* (1878), and *Glimpses in the Twilight* (1885); also *The Unseen World* (1876); *Ghostly Visitants* (1882); A. Stolz, *Die Schreibende Hand* (1890); and Ingram's *Haunted Houses* (1884). See Carus Sterne's *Naturgeschichte der Gespenster* (Weim. 1863); Dr Tylor's *Primitive Culture* (1871); and Gurney and Myers, *Phantasms of the Living* (1886).

Apparitor, the general name for the public servants of the magistrates in ancient Rome, so called because they were at hand to carry out the magistrates' orders. The name is still applied to the lowest officer of an ecclesiastical court, also in a somewhat general sense to an officer of a civil court, and specially to the beadle of a university who carries the mace.

Appeal is the right or process of bringing under the notice of a higher court the judgment of a lower court which the appellant represents as erroneous in fact or law. Formerly, this right was a valuable guarantee against political oppression and private extortion—e.g. the appeal to royal judges from the courts of feudal barons. Now, the object of appeal is to secure uniformity in the administration of justice. This is effected not merely by the reversal of erroneous judgments which are appealed, but by the knowledge which every judge has of precedents in the Supreme Court, and that his own judgments are subject to appeal. The most important questions connected with the modern system of appeal are: (1) Whether in all cases, of whatever pecuniary value, appeal is allowed, and also whether at all stages, or only after final judgment; (2) On what conditions, as regards time, *interim* execution, and security for costs, appeal is allowed; (3) The relative constitution of the lower and higher courts.

In the civil law, the earliest form of appeal was the *provocatio* from the judgment of a criminal court to the Roman people. This fell into disuse under the *Questiones Perpetue*. The *appellatio* was a veto or interdict granted upon the *intercessio* of one complaining of a judicial act. The subordination of judges increased largely under the empire, and for some time the emperor, who was tribune for life and also proconsul, was the only final court of appeal. Latterly, the senate and the prætorian prefects also gave final decisions. Only six months were given for appeal from the most distant provinces. The law is stated in detail in the Digest, lib. xlix.

In the Christian Church, under the judicial system defined in the False Decretals, frivolous appeals direct to the Roman Consistory multiplied enormously. The remonstrances of St Bernard were gradually given effect to by the Lateran and Basel Councils, and wholesome restrictions on the right of appeal, and in favour of the independence of Cisalpine church courts, passed into most modern concordats. Even the indirect recognition of the judicial supremacy of the pope was in England made a statutory offence under the name of *Præmunire*. The famous *appel comme d'abus* in France was originally an appeal to civil justice against the encroachments of church jurisdiction. Enough has been said to show how closely the question of appeal is connected with the great problems of political history—national independence, the relations of central and provincial authorities, &c.

In English law, prior to the Judicature Acts, 1873 and 1875, the word appeal was not commonly

used. In common law courts, there was a proceeding in 'error' by 'assignment of error' and 'joinder of error.' The old 'writ of error' and 'writ of false judgment' are still sometimes used in bringing up the proceedings of certain inferior courts. In Chancery, the appeal was formerly called 're-hearing,' the Vice-chancellor being regarded as the delegate of the Lord Chancellor. Under the modern system of 'fusion,' every judgment in the High Court of Justice (except a judgment of the Court of Probate where leave is required) may by simple motion be submitted to the Court of Appeal, to have it reversed, discharged, or varied. Interlocutory proceedings in chambers may also be appealed to a judge in chambers; and from him appeal lies to the Divisional Court. In the Chancery Division, the judge has the discretion of directing the matter to be argued before him in court, or allowing appeal direct to the Court of Appeal. An appeal in Divorce requires in many cases to be to the 'full court,' not to the ordinary Court of Appeal. This last court consists practically of six Lords Justices of Appeal, sitting in two divisions—one for Common Law Appeal; the other for Chancery, Probate, Admiralty, and Bankruptcy Appeal. The courts it superseded were: (1) In Chancery, the Lord Chancellor and Lords Justices; (2) At Common Law, the Court of Exchequer Chamber, consisting of the two Common Law Courts whose judgment was not under appeal. In 1873 it was proposed to abolish the appeal to the House of Lords, but still in all cases a petition of appeal may be brought to it from the judgments of the Court of Appeal. An appeal lies to the Judicial Committee of the Privy-council from an Indian or colonial court, but such appeal most frequently requires leave from the court below or the Judicial Committee, and, generally, security has to be given for costs.

As regards appeal from the inferior courts in England, an appeal lies from the county court to a divisional court of the High Court of Justice. All determinations in law by justices of the peace (including metropolitan police and stipendiary magistrates) may be brought up on a case stated under 20 and 21 Vict. chap. 43, for the opinion of a divisional court of the High Court of Justice. As to appeals in ecclesiastical causes, the Privy-council is the Supreme Court of Appeal in all ecclesiastical causes which may originate in the diocesan and provincial courts; but the High Court of Justice, especially in the Chancery Division, may frequently, in questions of trust and property and contract, have to decide purely spiritual questions.

Questions of law arising on the trial of a person convicted of treason, felony, or misdemeanour (e.g. at the Central Criminal Court, the assizes or quarter sessions), may be reserved by the judge or justice trying the case for the consideration of the Court for Crown Cases Reserved, established by the Act 11 and 12 Vict. chap. 78. This court must consist of at least five judges of the High Court of Justice.

The law of appeal in Ireland is practically the same as in England.

In Scotland, in the Court of Session the judgments of the Lords Ordinary sitting in the Outer House are appealed by a reclaiming note to the First or Second Division of the Inner House. The opinion of four judges is thus obtained on the opinion of one judge. These appeals are discouraged, except after final judgment by the Lord Ordinary, but they are competent at other stages, though in most cases only with leave of the judge. From all final judgments of the Inner House there is an appeal to the House of Lords within a period of one year. Where the judgment is not final,

leave to appeal must be got, unless there has been a difference of opinion among the judges. Pending an appeal, the Court of Session have absolute power to regulate *interim* possession of property or execution of a decree for money.

The Court of Session has exclusive jurisdiction as a Court of Review in *civil* causes over all inferior courts, even in cases where its original jurisdiction is excluded, unless there be an express exclusion of review by statute; and where appeal is excluded, the Court of Session has jurisdiction to set aside their decisions, where they have acted in excess of their statutory jurisdiction. In the latter case, the technical remedy is generally by a note of suspension or an action of reduction. The normal appeal, however, from final judgment in the Sheriff Court is by Note of Appeal under the Court of Session Act, 1868, and this goes directly to the Inner House. Cases are often brought up before judgment in the Sheriff Court for jury trial in the Supreme Court. The Court of Session, sitting as the Registration Appeal Court and the Valuation Appeal Court, hears appeals from the Registration Courts held by the sheriffs, from the valuation committees of the commissioners of supply, and from the magistrates in burghs; and there is also an appeal as to excise duties from the justices at quarter sessions.

Within the Sheriff Court itself, the right of appeal from the sheriff-substitute to the sheriff-principal is regulated by the Sheriff Court Acts, 1853 and 1876. Appeals from the Small Debt Court are confined to certain grounds mentioned in the Act 1 Vict. chap. 41 (such as malice and oppression and defect of jurisdiction in the judge), and are made to the next Circuit Court of Justiciary.

At common law, the High Court of Justiciary may review the proceedings of all inferior courts in criminal matters, but not on the merits. This is mainly done by the remedies of advocacy and suspension. As regards summary prosecutions before magistrates, the right of appeal consists of a case stated for the opinion of the High Court of Justiciary or the Court of Session, according to the criminal or civil nature of the prosecution. This is regulated by the Summary Prosecutions Appeals Act, 1875. Where a question of law arises on a criminal trial by jury, whether before the sheriff or at circuit, there is no right of appeal to the High Court of Justiciary. The judge presiding at circuit occasionally 'certifies' a question of law as requiring discussion at the High Court, but he is not bound to do so. There is no appeal from the High Court to the House of Lords, although this right was frequently claimed last century.

In ecclesiastical courts in Scotland, there is in most cases a regular appeal from Presbytery to Synod, and from Synod to General Assembly. In questions of contract, property, or trust, however, it has been found impossible to exclude the jurisdiction of the civil courts.

In the United States, the distinction between an appeal, which originated in the civil law, and a writ of error, which is of common law origin, is that the former carries the whole case for review by the higher court, including both the facts and the law; while the latter removes only questions of law. An Act of Congress of 1875 provides that the judgments and decrees of the circuit courts of the United States shall not be re-examined in the Supreme Court unless the matter in dispute shall exceed the sum or value of \$5000, exclusive of costs. No judgment, decree, or order of a circuit or district court, in any civil action at law or in equity, shall be reviewed in the Supreme Court on writ of error or appeal, unless the writ of error is brought, or the appeal is taken, within two years after the

entry of such judgment, decree, or order; save in the case of infants, insane persons, and imprisoned persons, when the period is two years, exclusive of this term of disability. An appeal from a district court to the circuit court of the United States must be taken within one year. An appeal from the district court in admiralty to the circuit court must be made immediately after the decree, in open court, before the adjournment *sine die*; and it should be taken to the next succeeding circuit court. An appeal may be taken from the state courts to the Supreme Court of the United States, in cases involving the validity of a treaty or statute of, or authorised under, the United States; on the ground of repugnance to the constitution; and in certain other specified cases.

Appendicularia, a genus of Ascidians (q.v.), and type of a small but important order, the members of which retain the larval vertebrate characters which are lost in the more or less degenerate adult sea-squirrels. Appendicularia is a minute free-swimming form with a long tail, and closely resembles an Ascidian larva. The brain and dorsal nerve-cord, the lung notochord, the two respiratory slits opening directly from the pharynx to the exterior, and other vertebrate structures lost in the adult Ascidians, are here retained throughout life, and demonstrate the true position of the class to which Appendicularia belongs.

Appenzell (from *Abbatia Cella*), a double canton in the NE. of Switzerland. It is divided into two divisions—Innerroden and Ausserroden; the former of which is peopled by Roman Catholics; the latter by Protestants, and noted for its dense population. The surface is mountainous, especially in the south, where Mont Sents attains an elevation of 8220 feet. The chief river is the Sittern, which flows through the centre of the canton. The constitution of the half cantons, each differing from that of the other in many details, is in each case a pure democracy. The inhabitants are chiefly employed in agriculture and cattle-keeping; in Ausserroden, however, there are cotton manufactures and embroidery carried on. The dialect is peculiar, and the Appenzellers wear a characteristic costume. The canton, once dependent on the Abbey of St Gall, won its independence after a struggle, and joined the seven old cantons in 1452. Area, 162 sq. m.; pop. (1880) 64,799, of whom 60,000 are in Ausserroden.

Appenzell, capital of the canton, is situated on the left bank of the Sittern; pop. (1880) 4302 (157 Protestants). The town is ill built, and has only a small trade in linens. The largest town is Herisan (pop. 11,082).

Apperley, CHARLES JAMES, an English sporting writer, born in Denbighshire in 1777. Educated at Rugby, he married early, and settled in Warwickshire, where he devoted himself to hunting. In 1821, under the name of 'Nimrod,' he began to contribute such attractive articles to the *Sporting Magazine* that its circulation was soon doubled. The proprietor paid him handsomely, and advanced him money, but his heirs afterwards brought an action against Apperley for its recovery. Nimrod prudently transferred himself to France, where he chiefly resided during the rest of his life. He died 19th May 1843. His best writings are *The Chase, the Turf, and the Road*, which appeared in the *Quarterly Review* (1827), and the *Life of a Sportsman*, to the 1873 edition of which is prefixed a memoir of himself.

Appert, BENJAMIN NICOLAS MARIE, a French philanthropist, born in Paris, September 10, 1797, began about 1816 to introduce into several schools in the Nord department a system of mutual instruction, and in 1820 to teach the prisoners at

Montaigu. Suspected of having aided the escape of two prisoners, he was himself in gaol for three months. In 1825 he travelled through the whole of France, in order to discover means of elevating the criminal classes, and recorded the results of his investigations in a Journal started for this purpose. From 1841 to 1844 he managed a colony for liberated prisoners and the children of prisoners at Némelfing, in the Moselle department; and after 1846 he travelled in Belgium, Germany, and Austria, giving the results of his observations on the management of schools and prisons in several works, marked by great fairness and candour. He also wrote a work entitled *Dix Ans à la Cour du Roi Louis-Philippe*, and, in his *Conférences contre le Système Cellulaire*, strongly opposed the system of solitary confinement.

Appetite (Lat. *appetitus*, from *appeto*, 'I desire') is generally used of the natural desire for food experienced in health. Its causes are two: (1) A condition of the *stomach*, not yet accurately understood, relieved by taking food; (2) A condition of the *system*, not relieved till the products of digestion begin to be absorbed into the blood. These are usually present together, but either may act without the other. The stomach-condition is that in which the organ is in the most favourable state for digestion, and tends to recur at the habitual meal-hours; but often passes off if eating be long deferred, though the need and craving of the system for food remains. Hence the importance of taking food at regular hours. Too free indulgence of a naturally large appetite frequently leads to indigestion and ill-health, especial in persons of sedentary habits. This danger is much less if the food be eaten slowly and thoroughly masticated; for in that case the digestion of the food first taken has advanced so far before the close of the meal, as to appease the system-appetite. Habitual stimulation of the appetite, especially by the pernicious practice of taking alcohol before meals, leads to equally injurious results.

Alteration of the appetite is perhaps the most common of all the symptoms of disease. Occasionally it is increased. *Morbid Appetites* may consist of a desire which is, in character, natural and necessary to the animal economy, but becomes unhealthy when excessive and irresistible. Of this, the hunger which attends marasmus, and the thirst which attends diabetes, may be cited as illustrations. They may consist, further, in a craving for articles or objects not in reality deleterious or detrimental, but which do not constitute the ordinary gratification of the appetite, such as the desire for chalk and lime experienced by chlorotic and hysterical women. They may, thirdly, consist in the longings, often complicated with delusions, felt by pregnant women and others, which are injurious, repugnant to nature, and revolting. Georget gives an instance where a wife coveted the shoulder of her husband, killed him in order to obtain the morsel, and salted the body in order to prolong the hideous cannibalism. In such a case, the gross longing may be said to constitute the disease; but there are others in which it is one of many symptoms demonstrating the degradation of the mind under general disease, as when the insane devour garbage and excrement, or swallow grass, hair, stones.

Much more frequently the appetite is diminished, and accordingly medicines which increase the appetite and improve the digestion are often necessary. The chief of these *stomachic tonics* are—vegetable bitters, as quinine, hop, gentian; dilute mineral acids; salts of iron; pepsin and other digestive agents prepared from the organs of the lower animals. See DIET, DIGESTION, DYSPEPSIA, FOOD; cf. also THIRST.

Appian (Lat. *Appianus*), a native of Alexandria, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. He was author of a Roman history in twenty-four books, of which only eleven are extant. It was remarkable principally for the plan on which it was written. Instead of proceeding to exhibit chronologically the growth of the empire, its author divided his work into ethnographic sections, recording separately the history of each nation up to the time of its conquest by the Romans. First in order were the books devoted to the old Italian tribes, and afterwards followed the history of Sicily, Spain, Hannibal's wars, Libya, Carthage and Numidia, Macedonia, Greece proper and its colonies, Syria, Parthia, the Mithridatic war, the civil wars, and the imperial wars in Illyria and Arabia. As a historian, Appian is a mere compiler, and not very accurate in his compilation. His geographical knowledge, in particular, is singularly deficient, considering the age in which he lived. One specimen of his blunders will suffice; in his section on Spain, he states that it takes only half a day to sail from Spain to Britain. The edition by Schweighäuser (1785) is esteemed, but the best text is that in Bekker's edition (2 vols. Leip. 1852-53).

Appia'ni, ANDREA, styled in his day 'the Painter of the Graces,' was born at Milan, May 23, 1754. His style was formed from a close study of the works of Raphael and other masters of fresco-painting, and his first works were a series of frescoes in Milan. His best works are the frescoes of the myth of Eros and Psyche in the royal villa at Monza, the cupola-paintings in the church of *Santa Maria di S. Celso* at Milan, and Apollo with the Muses in the Villa Bonaparte. Napoleon I. patronised him, but after his fall Appiani fell into great poverty. He died at Milan, November 8, 1817.

Appian Way (Lat. *Via Appia*), well named by an ancient writer *Regina Viarum* ('the queen of roads'), was formed, in part at least, by Appius Claudius Cæcus, while he was censor (313 B.C.). It is the oldest and most celebrated of all the Roman roads, and with its branches connected Rome with all parts of Southern Italy. It had an admirable substructure or foundation, from which all the loose soil had been carefully removed. Above this were various strata cemented with lime; and lastly came the pavement, consisting of large hard hexagonal blocks of stone, composed principally of basaltic lava, and jointed together with great nicety, so as to appear one smooth mass. The cost must have been enormous, for the natural obstructions are great. Excavations instituted by the papal government in 1850-53 reopened the road as far as Albano. The railway from Rome to Naples crosses this restored portion (now called the *Via Appia Nova*) near the eleventh milestone from the capital.

Appin (*Apthane*, 'abbey lands'), a beautiful coast district of Argyllshire, extending along the east shore of Loch Linnhe, 15 miles NNE. of Oban. It is the country of a branch of the Stewarts, whom Hogg has celebrated in verse, and a history of whom was published at Edinburgh in 1880.

Appius Claudius. See CLAUDIUS (APPIUS).

Apple (*Pyrus malus*). For the generic character, see PYRUS). This well-known fruit has been very long cultivated, and by that means it has been very much improved. It was extensively cultivated by the Romans, by whom, probably, it was introduced into Britain. The wild apple, or Crab-tree, a native of Britain, and very generally found in temperate climates of the northern hemisphere, is a rather small and often somewhat stunted-looking tree, with austere, uneatable fruit; yet it is

the parent of all, or almost all the varieties of apple so much prized for the dessert. The apple-tree, even in a cultivated state, is seldom more than 30-40 feet high. It has a large round head; the leaves are broadly ovate, much longer than the petioles, woolly beneath, acute, crenate, and provided with glands; its flowers are always produced in sessile umbels, and are various in size, according to the variety. Some are almost as white as pear-bloom, but the great majority are either striped or tinged with rosy tints outside, and some are of bright carmine. All have a delicate

Branch of Apple with young Fruit:
a, piece of the blossom.

fragrance, much more refined than that of pear-bloom. The fruit is roundish, or narrowest towards the apex, with a depression at each end, generally green, but also frequently yellow, light red, dark red, streaked, sometimes even almost black, with the rind sometimes downy, sometimes glabrous, sometimes thickish, and sometimes very thin and transparent, varying in size from that of a walnut to that of a small child's head—the taste more or less aromatic, sweet, or subacid. It is produced on spurs which spring from branchlets of two or more years' growth, and continue to bear for a series of years. The fruit of the apple is, with regard to its structure, styled by botanists a *Pome* (q.v.). The eatable part is what is botanically termed the *mesocarp* (see FRUIT), which, in its first development, enlarges with the calyx, the summit of the fruit being crowned in general by the dried quinquefid sepals; the *endocarp* being, when ripe, cartilaginous, and containing in its cells seeds which do not correspond with them in size, but are so free as sometimes to rattle when it is shaken. Dr Hogg has introduced a more scientific classification of varieties, according to the structure of the stamens, the tube, the carpels, and the sepals.

The apple is now one of the most widely diffused of fruit-trees, and for the general fruit-supply of Britain is the most valuable of all. It succeeds best in the colder parts of the temperate zone. It is, however, to be met with on the coasts of the Mediterranean Sea, in Arabia, Persia, the West Indies, &c., but there its fruit is as small and worthless as in high northern latitudes. The varieties in cultivation are by far too numerous. They have been classified with great care by German, French, English, and American writers, by whom the classification and description of apples, pears, and similar fruits has been made quite a matter of science, and entitled Pomology. Metzger, in his description of the pomaceous fruits of Southern Germany, describes 89 different kinds of apple, all of which are constant, besides sub-varieties. There are now at least 2000 varieties

cultivated in Great Britain, and perhaps twice that number, for many provincial sorts have as yet escaped the pomologist. New varieties are continually produced from seed; and as the apple is chiefly propagated by grafting—although some few can also be raised by means of layers and cuttings—the older varieties are superseded in many cases by newer ones. But some of the best kinds still in use can be traced back for centuries. The *costard*, from which dealers in apples received the name of costardmongers, still exists, though not largely grown, perhaps on account of the ribbed formation, from which it is believed to take its name, *pomum costatum*. Certain family divisions have been made, popular rather than correct, of apples (as of pears and plums)—e.g. Pippins, Codlins, Russets, Rennets, Pearmains, Calvilles, Crabs, &c. Some kinds, not approved for the dessert, are in high esteem as baking-apples, and others still more acid or austere are preferred for the manufacture of Cider (q.v.).

The apple is grown in Britain either as a standard, an espalier, or a wall-tree, and is variously trained. It was generally grafted on apple or crab stocks, but now a dwarf variety, either the *Paradies* or *Doucin* stock, is largely used to restrict the growth and hasten the time of bearing; and trees thus dwarfed are often very productive when little larger than currant or gooseberry bushes. Some of the varieties of apple are more hardy than others, and are therefore to be preferred for cold or exposed situations. Some of the finest kinds succeed well only when the soil and climate are good. Some kinds are much earlier than others in flowering, some in ripening. It is a mistake to suppose that an early bloomer is therefore an early ripener. The converse is frequently the case with all *fruit-trees*.

The wood of the apple-tree is hard, durable, and fine-grained. The crab is often planted both as an ornamental tree and for the sake of its wood. The bark contains a yellow dye.—As a fruit-tree, the apple requires a fertile soil and sheltered situation. The various uses of the fruit—for the dessert, for baking, preserving, making jelly, &c., as well as for making the fermented liquor called cider—are sufficiently well known. Vinegar is also made from it; and sometimes a kind of spirit, especially in Switzerland and Swabia. It contains *Malic Acid*, which is extracted for medicinal purposes.—The fermented juice of the crab apple is called *Verjuice*. It is used in cookery, and sometimes medicinally; also for the purifying of wax. Apples are an important article of commerce. Great quantities are imported into Britain, chiefly from France, Canada, and the northern parts of the United States. The apple keeps better than most kinds of fruit. *Beaufins* or *Biffins* are apples slowly dried in bakers' ovens, and occasionally pressed till they become soft and flat. They are prepared in great quantities in Norfolk.

The SIBERIAN CRAB is perhaps the parent, by hybridisation or otherwise, of some of the varieties of apple now in cultivation. Two species partake this designation, both natives of Siberia, and frequent in gardens in Britain—*Pyrus baccata* of Linneus, and *Pyrus prunifolia* of Willdenow, which, however, scarcely differ, except that in the former the sepals (leaves of the calyx) are deciduous, in the latter they are persistent—a circumstance of very doubtful importance as a specific distinction. The fruit is sub-globose, yellowish, and rather austere, but is good for baking and for preserves.

The AMERICAN CRAB or SWEET-SCENTED CRAB (*P. coronaria*) is a native of North America, especially of the southern part of the Alleghanies. It is a small tree with broad leaves and white flowers, becoming purple before they drop off, and

which have a powerful smell, resembling that of violets. The fruit is flatly globose, of a deep green colour, and sweet scented. It is very acid, but is made into cider, and also into preserves. *P. angustifolia*, a native of Carolina, much resembles this, but has much narrower leaves, and smaller fruit.

The CHINESE CRAB (*P. spectabilis*) is a small tree, a native of China. It is very ornamental when in flower; the flowers being in sessile, many-flowered umbels, and of a bright rose-colour. The fruit is irregularly round, about the size of a cherry, yellow, and fit to be eaten, like the medlar, only when in a state of incipient decay. See the *Report of the National Apple Congress* (1884); *The Herefordshire Pomona*, edited by R. Hogg and H. G. Bull, 2 vols. folio (Hereford, 1876-85).

Appleberry. See BILLARDIERA.

Appleby, the county town of Westmoreland, on the Eden, 13 miles S.E. of Penrith. There is a castle, first mentioned in 1088, the keep of which, called Cæsar's Tower, is still in tolerable condition. Appleby was disfranchised by the Reform Bill of 1832, but it received a new municipal charter in 1885. Pop. (1881) 2899.

Apple of Sodom. See SOLANUM.

Appleton, a city of Wisconsin, U.S., 185 miles N. of Chicago, and 120 miles from Milwaukee by rail. It is noteworthy chiefly from its situation on the Grand Chute Rapids of the Fox River, which, with a descent of 30 feet in 1½ mile, affords immense water-power for flour, paper, and woollen mills. There are also manufactures of machinery. The city is the seat of Lawrence University (1847), a Methodist institution. Pop. (1880) 8005; (1887) about 12,000.

Appleton, CHARLES EDWARD, D.C.L., was born at Reading, 16th March 1841, and was educated at Oxford and in Germany. His reading was wide and varied, but he wrote little. He took a lively interest in the movement for the 'endowment of research,' and he founded in 1869 the *Academy*, whose special feature is its signed articles. He died at Luxor, in Upper Egypt, in 1879. See his *Life and Literary Relics*, by J. H. Appleton and A. H. Sayce (1881).

Appleton, DANIEL (1785-1849), the founder of the American publishing house of D. Appleton & Co., was born at Haverhill, Mass., where he commenced business as a retail trader. Removing to Boston, he afterwards settled as a bookseller in New York, and gradually built up one of the largest businesses of its kind in the United States. He retired in 1848 in favour of his three sons, of whom the last died in 1878. The success of the firm justified it in beginning, previous to 1857, the *New American Cyclopædia*, under the editorship of George Ripley and Charles A. Dana, which was completed in 1863, in sixteen volumes, at a cost of £100,000. A new edition was published in 1872-76. The same firm has issued many scientific and educational works.

Appogiatura ('leaning note'), an Italian musical term, designating a form of embellishment by insertion of notes of passage in a melody. The appogiatura notes are printed in a smaller character than the leading notes of the melody, and should always be given with considerable expression. There are two species, the long and the short. The former is now seldom printed, the music being written as played; the latter is usually termed an *Acciacatura*, and written with a short stroke across the stem of the note. The appogiatura proper takes half its length from the note it precedes, except when preceding a dotted note, from which it takes a third. The following is an example:

Written.

Played.

Appointment. In a deed or will, power is often given or reserved to a certain person to appoint the uses to which property may be applied. Thus, a marriage settlement may contain a power of appointment, enabling the wife to distribute her property among the children of the marriage at her own discretion. The appointment when it is made derives its force, and the party in whose favour it is made derives his title, from the instrument in which the power of appointment is contained. The Courts of Equity give relief against a defective appointment, or defective execution of a power, where there is what is called a 'meritorious consideration' in the person applying for such relief. As to what amounts to such meritorious consideration, Lord St Leonards, in his work on Powers, lays down that equity will relieve the following parties: (1) A purchaser, including in such term a mortgagee and lessee; (2) A creditor; (3) A wife; (4) A legitimate child; and (5) A charity. But in the case of a defective appointment by a wife in favour of her husband, there is no relief in equity; nor is the equity extended to a natural child; nor to a grandchild; nor to a father or mother, or brother or sister, even of the whole blood, much less of the half-blood; nor to a nephew or cousin. Against the legal consequences of an appointment, the Courts of Equity give no aid. See POWER.

In the Scotch law, the expressions *reserved power*, *faculty to burden*, and *faculty of distribution*, correspond to the English phrase 'power of appointment'; and the deed or instrument subsequently executed in virtue of the reserved power, is simply described according to the nature and quality of the conveyance so made; but the term *appointment* is not a technical word in Scotland.

Appomattox Courthouse, a village of Virginia, 20 miles E. of Lynchburg. Here General Lee, on April 9, 1865, surrendered the army of Northern Virginia, 27,805 men strong, to General Grant.

Apportionment may be stated to be this—that in the event of the termination of a life-interest by death, or of a more limited interest at a fixed period, the current rent or income shall be apportioned or paid over in such a way as to give the personal representatives of the party, or the party himself, as the case may be, a sum corresponding to the period that may have elapsed between the last date of payment and the death or other determination of the interest or estate. This was the effect of the Apportionment Act, 1834, which applies to the whole United Kingdom. It dealt chiefly with the cases of heirs of entail, liferenters, &c. The Apportionment Act of 1870 extends the principle to all rents, annuities, salaries, pensions, dividends, and other periodical payments, in the nature of income, so that all these now, like interest on money lent, are considered as accruing from day to day. When a person therefore dies, the income is counted up to the day of death, and is payable at the same time as the next quarterly or other payment would have been if no death had happened. The executor of the deceased, however, must recover the proportion, not from the tenant or debtor liable for the whole payment, but from the heir who receives it. Trade profits are not apportionable by virtue of the statute.

The word apportion is also used technically in English law to indicate (1) that a contract is divisible, so that a party may sue on one obligation, although he may not have performed all his obligations; (2) that a common of pasture may be divided proportionally among the owners of the common to which the pasture is attached.

Apposition, a term in Grammar signifying the annexing of one substantive to another, in the same case or relation, in order to explain or limit the first; as, *My brother, the physician*; *Thomas the Rhymist*. Whole sentences or clauses admit of apposition; thus, 'Napoleon sought the way to India through Russia—a stroke of genius.' Sometimes a connecting word is used where logical propriety would require apposition; as, *the city of Bristol, for the city Bristol*.

Appraisement. An appraisement signifies generally any valuation of property; but in England the term is also used technically to denote a valuation by two sworn appraisers under a distress for rent. Where the value of the appraisement does not exceed £5, a stamp of threepence is required, and if over £500, the duty is £1; between these amounts *ad valorem* stamp-duties from sixpence to fifteen shillings are exigible. Appraisements are exempted from duty if they are made (1) For the information of one party only; (2) In pursuance of the order of any Admiralty Court, or Court of Appeal therefrom; (3) For the purpose of ascertaining legacy, succession, or inventory duties; (4) With reference to the property of a bankrupt; (5) For Income-tax purposes.

An appraiser is a person licensed to make appraisements or valuations. The cost of the annual license is £2, but licensed auctioneers and attorneys require no special license. The appraiser is bound to write out the appraisement on duly stamped paper under a penalty of £50, and any person receiving or paying for an unstamped appraisement is liable to forfeit £20.

Apprehend. See ARREST.

Apprentice is a person described in law-books as a species of servant, and called apprentice, from the French verb *apprendre*, 'to learn,' because he is bound by indenture to serve a master for a certain term, receiving in return for his services instruction in his master's profession, art, or trade; the master, upon the other hand, contracting to instruct the apprentice, and, according to the nature of the agreement, to provide food and clothing for the apprentice, and to pay him small wages. The system of apprentices was incidental to the old craft guilds. Only apprentices were admitted to the freedom of the craft, and thus not only was monopoly secured, but a valuable organisation of the trade. In England the system was widespread and important, both in the early history of trade and from its later connection with the English poor-law system, under which apprenticeship gave a right of settlement. In Scotland the system never had the same importance, and now, except in one branch of the legal profession, apprenticeship is voluntary. By a provision of the 5 Eliz. chap. 4, it was in general required that every person exercising a trade in England should have previously served as apprentice to it for seven years; but by later statutes, that provision was abolished, with a saving of the customs and by-laws in London and other corporations; and the term of apprenticeship is now determined by the mutual convenience of the contracting parties. By the Municipal Corporation Act, 1834, all such customs and by-laws as had the effect of prohibiting trades and occupations to persons who had not served as apprentices were also abolished. But in many trades the modern unions still practically enforce a law restricting the

number of apprentices, &c., and prohibiting the employment of those who have not served as apprentices. Apprentices, in general, are bound out by their friends, though with their own consent, testified by their executing the indentures, without which the transaction is not binding. To the same effect it is the rule of the Scots law that although a pupil may be a party to an indenture as an apprentice, yet he must have the concurrence of a parent or guardian, who alone can be liable to the master for the apprentice's non-performance of the engagement. An apprentice, on the other hand, who has passed the years of pupilarity, may effectually enter into an indenture by which he will be personally bound. It has been decided in England that the express assent of an infant apprentice to the indentures is essential to the contract. As a rule, writing is essential, and a cautioner or surety is generally required. Under the Stamp Acts the indenture is void if the full consideration is not set forth. The apprentice is bound to enter the service and continue in it; and even after enlistment in the army, the apprentice, if under the age of twenty-one, may be reclaimed by the master by a proceeding before a justice of the peace. The master has also an action against any one who entices away an apprentice. The master is entitled to the apprentice's earnings. The apprentice must be obedient, diligent, respectful towards his master, and must behave decently and honestly; but the misconduct must be gross to justify dismissal. The apprentice must accompany the master on a change of residence. The master, on the other hand, must teach the apprentice his whole art and mystery. He must treat him properly, and provide him with medical attendance and medicine in sickness. He cannot assign the apprentice to another.

There is a special class of apprentices in England who are bound out by the guardians of the poor, and are called *parish apprentices*. Formerly the children of poor persons might, even without becoming parties to the indentures, be apprenticed out by the overseers with the consent of two justices (now by the guardians, without such consent), till twenty-one years of age, to suitable persons; and such persons might till 1844 be compelled to take them. But the reception of any poor child as an apprentice is no longer compulsory. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained. This is under the control of the Local Government Board, who make new rules from time to time, as they may think fit; and the justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures, upon reasonable cause shown.

An apprentice's indenture is terminable by the consent of all the parties to it; and also by the death of the master, or of a partner of the employing firm. In such cases a portion of the fee is generally returnable. On the death of the apprentice, however, the fee is not returnable. But the executor of the master may bind the apprentice to another master if the contract so provide; and he must also discharge any covenant or agreement for the apprentice's maintenance, so far as he has assets. By the custom of London, if the master of an apprentice die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the apprentice to another master of the same trade. The bankruptcy of the master operates as a discharge of the indenture of the apprentice, who, if he has paid an apprentice fee to the bankrupt, is entitled to be paid by the court a reasonable sum out of the estate. Apprentices not paying premium,

and whose premium was less than £25, are in general subject to the provisions of the Employers' and Workmen's Act, 1875—i.e. a court of summary jurisdiction may order the apprentice to perform his duties, and in default imprison him; may cancel the indenture and order repayment of premium; and may award damages up to £10 against either party or the cautioner.

By the Army Act, apprentices enlisting in the army, and concealing their apprenticeship when brought before a magistrate to be attested, may be indicted for obtaining money under *false pretences*; and if, after the expiration of their apprenticeship, they do not surrender to a recruiting officer, they may be apprehended as deserters.

Apprentices to the sea service are governed by the provisions of the Merchant Shipping Acts. Superintendents of mercantile marine shall give to boards of guardians, overseers, and others, all assistance in their power for facilitating the apprenticing of boys under their charge to the sea service. In the case of boys bound by guardians of the poor, the indentures must be executed in presence of two justices, who shall see that the boy has attained 12 years of age, has consented to be bound, that he is of sufficient health and strength, and that the master is a proper person for the purpose. Indentures to the sea service are exempt from stamp duty. Before each voyage abroad, the master must bring his apprentices and their indentures before a superintendent. See MASTER AND SERVANT.

In the United States, the system of apprenticeship has largely become obsolete; little account is taken of indentures and the serving of time. But most of the states have laws on the subject.

Approaches, in military language, are the sunken trenches or excavated roads which are constructed by besiegers. See SIEGE.

Approbate and Reprobate, a technical expression in the law of Scotland, which means that no one can be permitted to accept and reject (*approbare and reprobare*) the same deed or instrument. Thus, if a settlement purporting to dispose of real and personal property, which it directs to be converted into money and to be divided among the testator's children, should be invalid for the conveyance of the real estate, which, accordingly, becomes the property of the eldest son as his father's heir; then the law does not permit the latter to enjoy such estate, and at the same time to take benefit under the will in other respects (for this would be simultaneously to accept and reject the same instrument). He must elect between the two alternatives, and either avail himself entirely of his rights at law, as heir, or claim his share of the whole estate according to the testator's manifest intention. In such cases the forfeited provision is generally applied in compensation to those legatees whose interests have been affected by the action of the heir; but when such compensation is fully made, there is no reason why the heir should not receive the balance of the provision. It must appear that the testator intended to impose a condition which was within his power, but this need not be stated in so many words. No legatee, however, is bound finally in such a matter unless he knows exactly how his interests are affected. The analogous doctrine in the law of England is called Election (q.v.).

Appropriation is the opposite of expropriation, and means making something the property of a particular person—e.g. game, which is the property of no one, is appropriated by capture; or one man is said to appropriate the ideas of another. The word has various important applications in law. (1) Where so much iron or oil, for

instance, has been sold, but the quantity is not separated by weight or measurement from a larger mass; or where a certain proportion is sold, but the exact quantity or price is not known until measurement, &c.; in such cases the risk of the goods perishing and the substantial ownership do not pass to the buyer. Before delivery, however, the goods may be appropriated so as to produce this effect. (2) When a bill is drawn against goods, and the bill of lading is sent as a security to the acceptor, the goods are said to be appropriated to the payment of the bill. (3) Where several debts are due to the same creditor, the debtor, in making a payment, may appropriate it to a particular debt. If he does not do so, the creditor may apply it as he pleases—e.g. to the least secured debt, or to interest instead of principal. Where the parties say nothing, the law appropriates the payments in order of date. Thus, in a banking account, the first item on the credit side is applied to the first item on the debit side, and so on. In church law, an appropriator is the owner of a benefice—e.g. the lay rector who receives the tithes, but is bound to appoint a vicar or perpetual curate for the spiritual service of the parish. In constitutional law, appropriation means the principle that 'supplies granted by parliament are only to be expended for particular objects specified by itself.' This principle was acted on by the Commons during the Commonwealth, was definitely established during the Dutch war of 1665, and since the reign of William III. has been expressed in the Annual Appropriation Act by a clause prohibiting the treasury officials from applying public money to any service other than that to which it has been specially appropriated.

Appropriation Clauses were an important feature in measures repeatedly proposed, and as often rejected, in connection with the agitation and legislation for the commutation of tithes in Ireland between 1833 and 1838. After the passing of the imperfect Commutation Bill of 1833, and the Irish Church Temporalities Bill, the House of Commons passed, in 1835, a resolution that the surplus revenues of the Irish Church, thus set free, should be 'appropriated' to the 'moral and religious education of the whole people, without distinction of religious persuasion.' A bill for commutation of tithes, recognising this principle, was passed by the Commons in 1836, but rejected by the Lords; and again in 1837. A last attempt was made in 1838 to include appropriation clauses, but was defeated; and a government measure, commuting tithes into a rent-charge of three-fourths of their amount, was passed without the debated clauses. See **TITHES**.

Approver, or **PROVER**, in the law of England, is a person who has been an accomplice in the perpetration of a crime, but who is admitted to give evidence against the prisoner. Formerly it was applied to one guilty of treason or felony who confessed on the promise of a pardon, conditional on the conviction of those whom he implicated.

The modern practice is to admit accomplices to give evidence for the prosecution, or, as it is said, to turn *Queen's evidence*, upon an implied promise of pardon, on condition of their making a full and fair confession of the whole truth. This assurance is generally given by the committing magistrate. The admission, however, of an accomplice to give evidence against his fellows requires the previous sanction of the judges of jail delivery, and a motion is usually made at the trial to the judge for leave to admit the accomplice for that purpose, which leave is not given unless the evidence appears to be necessary, and likely to be

corroborated. The testimony of an accomplice is in all cases, however, regarded with just suspicion; and unless his statement is corroborated in some material part by unimpeachable evidence, the jury are usually advised by the judge to acquit the prisoner; and if the accomplice, after having confessed the crime, and being admitted as *Queen's evidence*, does not satisfy the condition on which he was so received by failing to give full information without equivocation, reservation, or fraud, he then forfeits all claim to protection, and may be tried, convicted, and punished on his own confession. The practice, however, is to direct an acquittal before the accomplice is examined, if he has been joined in the indictment.

The term in the law of Scotland analogous to that of approver is *socius criminis*, and the principles on which the socius is admitted, and on which his evidence is left to the jury, are the same as in England. But the criminal courts in Scotland give absolute protection to the socius who has been examined, after proper warning from the judge that what he says cannot be used against him. This privilege is altogether independent of the prevarication or unwillingness with which the witness may give his testimony. Justice, indeed, may often be defeated by a witness retracting his previous disclosures, or refusing to make any confession after he is put into the box; but it would be much more put in hazard if the witness was sensible that his future safety depended upon the extent to which he spoke out against his associate at the bar. The only remedy, therefore, in such a case, is committal of the witness for contempt or prevarication, or indicting him for perjury, if there are sufficient grounds for any of these proceedings. Attention was called in parliament to the law of Scotland in this matter, in connection with the case of Jessie M'Lauchlan in 1863.

Approximation, a term commonly used in mathematical science to designate such calculations as are not rigorously correct, but approach the truth near enough for a given purpose. Thus in logarithmic and trigonometrical tables nearly all the numbers are mere approximations to the truth. The calculations of astronomy generally are of this nature. Even in pure mathematics there are parts in which approaches to the truth, by means of interminable series, are all we are able to gain. The solution of equations beyond the fourth degree can be got only by approximation.

Apraxin, **FEODOR, COUNT**, the creator of the Russian navy, and long the most powerful man in the court of Peter the Great, was born in 1671. Entering the navy, he rapidly rose to be admiral. In 1708 he defeated the Swedes; in 1710 he captured Viborg, in Finland; and in 1711 commanded in the Black Sea during the Turkish war. Again, in 1713, he conducted the war with Sweden so successfully that Russia was confirmed in her possession of Finland, just conquered, and of Esthonia. In 1714, however, and again in 1718, he was charged with responsibility in connection with embezzlement, tried, and condemned to pay a fine; but in spite of this and his opposition to many of Peter's reforms, his services were too useful to be dispensed with. In 1722 he accompanied Peter in his Persian war. He died in 1728.

Apricot (*Prunus armeniaca*), a species of the same genus with the Plum (q.v.), is a native of Armenia, and of the countries eastward to China and Japan; a middle-sized tree of 15-20, or even 30 feet high, with ovate, acuminate, and cordate, smooth, doubly-toothed leaves on long stalks; solitary, sessile, white flowers which appear before the leaves, and fruit resembling the peach, roundish, downy, yellow, and ruddy on the side next the sun,

with yellow flesh. The apricot was brought into Europe in the time of Alexander the Great, and since the days of the Romans has been diffused over all its western countries. It has been cultivated in England since the middle of the 16th

Apricot (*Prunus armeniaca*).

century. It is only in the south of England that it is ever trained as a standard, nor is it grown in the more northern parts even as an espalier, but almost always as a wall-tree. More than twenty kinds are distinguished, amongst which some excel very much in size, fine colour, sweetness, and abundance of juice. The *Moorpark* is generally esteemed the finest variety, and the *Breda* as best suited for standards in the south of England, and in Scotland even for the wall, except in the most favourable situations.—The apricot is generally budded on plum or wild cherry stocks. The fruit keeps only for a very short time, and is either eaten fresh, or made into a preserve or jelly. Apricots split up, having the stone taken out, and dried, are brought from Italy as an article of commerce, in particular from Trieste, Genoa, and Leghorn: in the south of France, also, they are an article of export in a preserved and candied state. Dried apricots from Bokhara are sold in the towns of Russia, the kernels of which are perfectly sweet, like those of the sweet almond. The kernels are sweet in some kinds, and bitter in others—the bitterness being probably more natural, and the sweetness, as in the almond, the result of cultivation. Generally speaking, they may be used for the same purposes as almonds. From the bitter kernels, which contain Prussic acid, the *Eau de noyau* is distilled in France. The charred stones yield a black pigment similar to Indian ink. The wood of the tree is good only for the purposes of the turner.

The Briançon Apricot (*P. brigantia*) very much resembles the common apricot. The fruit is glabrous. It is found in Dauphiné and Piedmont. At Briançon, an oil, called *Huile de marmotte*, is expressed from the seeds. The Siberian Apricot (*P. sibirica*) is also very like the common apricot, but smaller in all its parts. The fruit is small. It is a native of Siberia, especially of the southern slopes of the mountains of Dahuria. The Apricot Plum is, as the name implies, not an apricot. It is an excellent kind of plum, which, in some parts of France, is preserved in sugar, dried, and extensively exported.

The older form of the name, *apricock*, best shows the descent of the word through Portuguese *albricoque*, Arab. *al* (the) *barqûq*, and late Gr. *praiokion*, from Lat. *præcoqua*, *præcox*, 'early ripe.'

April. The Romans gave this month the name of *Aprilis*, derived from *aperire*, 'to open,' probably

because it is the season when the buds begin to open; by the Anglo-Saxons it was called Easter-month. The custom of sending one upon a bootless errand on the first day of this month, has been supposed to be a travesty of the sending hither and thither of the Saviour from Annas to Caiaphas, and from Pilate to Herod, because during the middle ages this scene in Christ's life was made the subject of a Miracle-play (q.v.) at Easter, which usually occurs in April. It is more probable that it is a relic of some old heathen Celtic festival. The custom, whatever be its origin, of playing off little tricks on this day, whereby ridicule may be fixed upon unguarded individuals, appears to be universal throughout Europe. It is believed that both England and Germany derived the custom from France. In France, one thus imposed upon is called *un poisson d'Avril* (an April fish). In England, such a person is called an April fool; in Scotland, a gowk. Gowk is the Scotch for the cuckoo, and also signifies a foolish person. The favourite jest in Britain is to send one upon an errand for something grossly nonsensical; or to make appointments which are not to be kept; or to call to a passer-by that there is a spot of mud upon his face, or the like. When he falls into the snare, the term April fool or gowk is applied with a shout of laughter.

A priori. *A priori* reasoning, in Kant's use of the term, is that which rests on general notions or ideas, and is independent of experience; which is derived from the constitution of the mind, and is accordingly prior to all experience. But the word is used loosely in various senses; sometimes for reasoning from a general principle to its consequences; sometimes from observed facts to another fact or principle not observed; still more loosely for arguing from pre-existing knowledge, or even from cherished prejudices ('innate ideas' would be *a priori*). The Aristotelian usage made *a priori* reasoning from cause to effect; *a posteriori* from effect to cause. Now usually, reasoning from experience is called *a posteriori* reasoning. A predilection for one or the other of these forms of reasoning forms one of the most important distinctions among schools of philosophy. Plato and most of the great Germans may be taken as typical of the *a priori* school, Bacon and Locke of the empirical or experimental. *A priori* philosophy claims for its conclusions the character of necessary truths, and denies that there can be a *a posteriori* proof of anything, that kind of reasoning furnishing only a confirmation or verification. The opposite school maintain that the general notions or principles on which *a priori* reasoning rests are themselves the results of experience, and that, therefore, all truth rests really on *a posteriori* grounds. Synthetic and analytic, deductive and inductive, correspond in a general way to *a priori* and *a posteriori*. See ANALYSIS, DEDUCTION, INDUCTION, LOGIC, TRANSCENDENTALISM.

Apse (Lat. *apsis*), a semicircular or semi-octagonal recess usually placed at the east end of the choir or chancel of all early churches, up to and including those of the Romanesque and Norman styles. The origin of this peculiar termination to the choir is generally supposed to be as follows. It is believed that the heathen structure from which the early Christians borrowed the form of their churches, was not the temple but the Basilica or public hall, which served at once for a marketplace and a court of justice. The Basilica was generally a parallelogram, at one of the shorter sides of which, opposite to the entrance, there was a raised platform destined for the accommodation of the persons engaged in, and connected with, the distribution of justice. This portion of the

building was the prototype of the rounded choir, to which the name of apse was given. For the prætor's chair, which was placed in the centre of this semicircular space, the bishop's seat was substituted. This theory has, however, been disputed; Professor Baldwin Brown, of Edinburgh, maintaining that the apse was common to the *schola*,

The Church of the Apostles, Cologne.
(From a Photograph.)

or meeting-room, of the Christian and other guilds under the Roman empire, and contained the seat of the president (see *From Schola to Cathedral*, 1886). Apsees are to be met with in many English churches; but the structure is not only much more frequent, but continued to be used to a much later period on the Continent, and it may still be seen in almost every little village along the banks of the Rhine, and in the older churches of France and Italy. The lower part of the apse is usually pierced by two or three round arched windows, over which there is frequently an external arcaded gallery supported by small shafts; and the whole is joined to the end of the choir, which rises considerably above it, by a roof in the form of the segment of a cone. These features are all distinctly visible in the annexed illustration of the east end of the Church of the Apostles at Cologne, which is a typical example of Rhenish architecture. In this instance the transepts, as well as the choir, are terminated with round apsees, thus producing a triapsal arrangement, similar to many churches in the East. The semicircular form of apse is of Roman origin, but many apsees, especially in the south of France, are octagonal—a shape indicating a Byzantine influence. From 1100, some churches in Auvergne and the west of France began to adopt an aisle round the apse, and chapels were gradually introduced radiating from the aisle. These were ultimately developed in the 13th century into the splendid *chevets* of the great French cathedrals, such as Amiens and Beauvais. In Germany, numerous instances occur of churches with an apse at both the east and west ends. A few specimens are also found in the south of

France. The western apse is supposed to represent the baptistery, which was originally a separate round building, but was afterwards absorbed into the main edifice in this form. Several examples of the apse are to be seen in the earlier ecclesiastical structures of Scotland; as instances, we may mention the churches of Dalmeny and Leuchars.

Apsheron, a peninsula on the west coast of the Caspian Sea, belonging to the Russian government of Baku. It is interesting for its volcanic condition, its burning naphtha wells, and its mud volcanoes. Its enormous petroleum industry is described at Baku (q.v.).

Ap'sides (Gr. *apsis*, 'connection'), the two extreme points in the orbit of a planet—one at the greatest, the other at the least distance from the sun. The term apses is also applied in the same manner to the two points in the orbit of a satellite—one nearest to, the other farthest from, its primary; corresponding, in the case of the moon, to the perigee and apogee. A right line connecting these extreme points is called the line of apses. In all the planetary orbits, this line has no fixed position in space, but makes a forward motion in the plane of the orbit, except in the case of the planet Venus, where the motion is retrograding. This fact in the orbit of the earth gives rise to the Anomalistic Year (q.v.). This advancing motion of the line of apses is especially remarkable in the orbit of the moon, where it amounts to $40^{\circ} 40' 32'' \cdot 2$ annually, an entire revolution thus taking place in rather less than nine years. See MOON, PERTURBATIONS.

Apt (*Apta Julia*), a town in the French department of Vaucluse, 30 miles E. of Avignon. The cathedral dates from the 11th century. There are Roman remains in and near the town. Pop. (1881) 4260.

Ap'terous Insects are insects without wings. In the Linnæan system, the Aptera formed a distinct order of insects, and included a large number of incongruous forms. Many of these have been distributed to other orders, and the remainder—e.g. Collembola and Thysanura, are regarded as survivors of primitive forms. The term is now rarely used except as a descriptive adjective, equivalent to wingless. See INSECTS.

Apteryx (Gr. *a*, 'without,' *pteryx*, 'wing'), or Kiwi, a genus of New Zealand birds, belonging to the sub-class Ratite, in which the breastbone has no keel. It is thus allied to the ostrich-like birds.

Apteryx.

It is usually about the size of a large hen, but some measure two feet or more in height. The colour is reddish-brown or gray. Though incapable of flight, it is not really wingless; the rudimentary stump,

with short humerus and one complete digit, is merely hidden by the downy feathers which thickly cover the body. The barbs of the feathers are not united, and there is no aftershaft (see FEATHER). The short, scale-covered legs are strong, and enable the bird to avoid its enemies by rapid running. The three anterior toes are armed with strong claws, used in scratching and as weapons, while the posterior fourth toe is short and raised from the ground. The long, slender, rounded beak, with the nostrils at its tip, is largely used for pulling worms out of the ground. The bones of the body do not exhibit the usual air-cavities found in flying birds. The apteryx lies during the day in holes in the ground, or at the foot of trees, and comes out in the twilight. They feed on worms, grubs, and also 'hinau berries.' They make a peculiar snuffing noise when hunting or feeding. They live in pairs, and the female lays, apparently twice a year, a very large egg, which is deposited in a hole at the foot of a tree or tree-fern. The male takes some share at least in the labour of incubation. Four species have been distinguished, two of which belong to the North Island, and two to the South Island of New Zealand. It is, however, somewhat uncertain whether the four forms are really distinct.

Apuleius, or APPULEIUS, a Latin satirist of the 2d century, was born at Madaura, in Africa, where his father was a magistrate and a man of large fortune. Apuleius studied first at Carthage, and afterwards at Athens, displaying a special predilection for the Platonic philosophy. The fortune bequeathed to him at his father's death enabled him to travel extensively. He visited Italy, Asia, &c., and was initiated into numerous religious mysteries. The knowledge which he thus acquired of the priestly fraternities he made abundant use of afterwards in his *Golden Ass*. Having married a wealthy middle-aged lady, he was charged by her relations with having employed magic to gain her affections. His *Apologia*, still extant, was an eloquent and successful vindication of his conduct. After this event, his life appears to have been devoted zealously to literature and public oratory, in both of which he attained great eminence. The *Golden Ass*, the work by which his reputation has survived, is a romance, which is generally understood to have been intended as a satire on the vices of the age, especially those of the priesthood, and of quacks or jugglers affecting supernatural powers, though Bishop Warburton fancied he could detect in it an indirect apology for paganism. Its merits are great and conspicuous, as are also its faults. Wit, humour, satire, fancy, learning, and even poetic eloquence abound, but the style is disfigured by excessive archaisms and by a frequent affectation in the metaphors. The most exquisite thing in the whole work is the episode of Cupid and Psyche, Adlington's translation of which (1566) was republished in 1887, with a preface by Andrew Lang. Besides the *Apologia* and *Golden Ass*, we have from the pen of Apuleius an Anthology, a work on the Dæmon of Socrates, one on the doctrines of Plato, &c. There is a translation by Sir G. Head of the *Golden Ass* (1851), and of the entire works (1853), the best edition of which is by G. F. Hildebrand (Leip. 1843).

Apulia (modern *Puglia*), the south-eastern part of Italy as far as the promontory of Leuca, comprising the three provinces of Bari, Foggia, and Lecce, with an area of 8540 sq. m., and a pop. (1884) of 1,675,471. In ancient times it extended from the river Frento to the promontory Iapygium, and was bounded on the west by Samnium and Lucania, on the north by

the Frentani. More strictly defined, it was the country east of Samnium, on both sides of the Aufidus—the Daunia and Peucetia of the Greeks. The latter frequently applied the name Iapygia to include all Apulia. The inhabitants of Apulia formed three distinct peoples—the Messapians or Salentini, the Peucetii, and the Dauni or Apulians. Its principal cities were Arpi, Luceria, and Canusium. They first appear in history as concluding a treaty with the Romans, in 326 B.C., against the Samnites; but this they soon after repudiated, and in 317 all the Apulian cities submitted to Rome. The second Punic war was for some time carried on in this province, the battle of Cannæ (216 B.C.) being fought within its borders, and many of its cities were severely punished by the Romans for siding with Hannibal. A like fate overtook them at the close of the social war in 89 B.C., and the district has never since recovered its ancient wealth and prosperity. It is but a shadow of its former self in the time of the Greek colonies, under Roman dominion, or even under the Normans, who made a duchy of it in 1043 A.D. Most of the towns are depopulated, and agriculture is in a very low condition. See Gregorovius' *Apulische Landschaften* (2d ed. Leip. 1880).

Apu're, a navigable river of Venezuela, which rises near the western boundary among the Eastern Cordillera, and flows nearly 1000 miles eastward, past the towns of Nutrias and San Fernando, till it falls by six arms into the Orinoco.

Apu'rimac, a river of Peru, also called *Tambo*, which, after a northward course of 500 miles, helps to form the Ucayali, and finally joins the Amazon, of which it is one of the most southerly tributaries. It gives name to a province of Peru, with an area of 62,325 sq. m., and a pop. (1876) of 119,246.

Aqua Fortis (literally 'strong water') was the term used by the alchemists to denote nitric acid, and is still the commercial name of that acid.

Aquamarine, a name sometimes popularly given to the Beryl (q.v.), as being 'sea-coloured.' Some green and blue varieties of topaz have also been so styled.

Aqua Regi'ne (literally 'queen's water') is a mixture of concentrated sulphuric acid (oil of vitriol) and nitric acid, or of sulphuric acid and nitre. Either mixture evolves fumes largely, and may be used as a disinfectant.

Aqua Regis, or REGIA (literally 'royal water'), is the common name applied to a mixture of 1 part of nitric acid, and 2, 3, or 4 parts of hydrochloric acid. The general proportion is 1 to 2. The term aqua regia was given to the mixture from the power it possesses of dissolving gold, which is the *king of the metals*.

Aqua'rium, some contrivance on a large or small scale for keeping aquatic animals and plants alive out of their native habitat. Though the custom of keeping fish alive in tanks (*vivaria*) had been for long resorted to as a matter of domestic convenience, it is only since the middle of this century that the scientific and æsthetic value of aquariums has been appreciated. The Scottish naturalist Sir John Dalyell was one of the first (from 1790 onwards) to utilise simple aquariums for scientific purposes, and the almost historic long-lived sea-anemone 'Grannie' was one of his prisoners. In 1842 Johnston described the successful establishment of a small but well-peopled aquarium. Ward, Gosse, Warrington, and others did much to make both fresh-water and marine collections practicable and popular, and though the fresh enthusiasm of thirty years ago has to some extent died away, the number of public

and scientific aquariums has greatly increased. The large aquariums at Brighton and Hamburg are deservedly famous, and many others have been established both in towns for popular instruction and at the various zoological marine stations for purposes of scientific study. The first scientific and popular aquarium was that erected in the London Zoological Gardens in 1852. The Berlin Aquarium is a good instance of a well-managed collection at a considerable distance from the sea, while that in connection with the Naples Zoological Station has proved a most valuable acquisition in studying the habits and life-histories of marine plants and animals. For detailed information, the reports of the Brighton Aquarium and the Naples station should be consulted.

Fresh-water aquariums, though less decorative and interesting, are on some scale possible to every one, while the ready importation of sea-water or its artificial preparation makes it quite feasible for even inland residents to keep marine plants or animals in good condition. Since 1841 various recipes have been given for the artificial preparation of sea-water—e.g. by mixing with rather less than 4 quarts of spring-water $3\frac{1}{2}$ ounces of common table-salt, $\frac{1}{2}$ ounce Epsom salts, 200 grains of chloride of magnesium, and 40 grains of chloride of potassium. Into this sea-lettuce (*Ulva*) and other seaweeds should first be placed. For a successful aquarium careful aeration is essential; and this is effected either simply by the aid of a syringe, or by mechanical contrivances of fountain, drip-glass, &c., and as far as possible also by regulating the proportion of plants and animals, since these compensate one another in their relations to the atmosphere. Abundant light and careful purification are also necessary. Dead specimens must be removed before decomposition, and the water filtered when it shows signs of losing its clearness and fresh smell. Concentration of the sea-water through evaporation, original impurities in the water (which is best conveyed in fir-wood or stoneware vessels), contamination by dust, overcrowding, and the like, must obviously be avoided. As to the stock, experience is the surest though slowest guide; but hints can be obtained by consulting popular works on marine plants and animals—Mr Gosse's *Aquarium* (1854), and more modern works, such as that of Hughes. Kingsley's *Glaucus* is also of permanent interest to beginners.

Aqua'rius ('the Water-bearer'), the eleventh sign of the zodiac, through which the sun moves in part of the months of January and February. See ZODIAC.

Aquatic Animals. Apart from any speculations as to the more or less watery nook where the first forms of life were cradled, it is worth noting that the home of almost all the simpler animals is distinctly and necessarily aquatic. While a few of the Protozoa, such as one of the *Amœbæ*, occur in damp places on land, or within other organisms, the vast majority live freely in the water, and the same is true of the Sponges, Cœlenterates, and Echinoderms. Among worms, however, more emphatic exceptions occur, such as the earthworm, where the structure and habit of the animal has become distinctly adapted to terrestrial life. While the great majority of crustaceans again are aquatic, a few, such as the wood-louse and the land-crab, are modified for life ashore. The crowd of insects, spiders, and myriapods are of course terrestrial or aerial, though here also the habits of some adult forms, and the life of some of the young, are distinctly aquatic. Among molluscs also there is an equally familiar occurrence of both aquatic and terrestrial habit, while numerous forms illustrate

the transition from the former to the latter. The ascidians are exclusively marine. Some fishes have a limited power of life out of the water, the double-breathing Dipnoi (q.v.) being in this connection especially instructive. Among many amphibians, the transition from water to terra-firma is seen in the individual life-history, when the fish-like gilled tadpole becomes the lunged gill-less frog; while in a few exceptional cases, such as the black salamander of the Alps, the life is terrestrial from first to last, and even the young dispense with their preliminary swim as tadpoles, although a brief recapitulation of their aquatic life is still represented by a gilled stage within the body of the parent. The instance of the gilled Axolotl (q.v.) becoming, in the absence of sufficient water, the gill-less *Amblystoma*, forcibly illustrates the importance of the medium as a factor in evolution. Among reptiles there are numerous aquatic forms—chelonians, lizards, snakes, and crocodiles, though the absence of any gill-respiration marks the progressive general adaptation to terrestrial life. While an emphatically terrestrial amphibian like the tree-frog seeks a watery hole for the rearing of the young gill-breathing tadpoles, the habit is reversed in such reptiles as the sea-turtle, which having returned to the more primitive aquatic home, yet revisits the land for egg-laying purposes. The cradle of the young in both cases indicates the ancestral habit of the parent. Among the emphatically aerial birds, there are cases like that of the penguin, where the structure has become adapted to an almost exclusively aquatic life. And so among mammals, the sea-cow, the seal, and the whale are familiar illustrations of very different types which have returned to the primeval watery home and aquatic habit, with consequent change of structure.

To sum up the adaptations to aquatic life would obviously be to attempt to compress a large department of comparative physiology. It is more important simply to note the general fact that, in the water, animals are subjected to influences somewhat different in detail from those which mould their congeners ashore. Even contact with a different medium, varying in composition, in currents, in pressure, in contained food and oxygen, and the like, obviously involves a great diversity in structure. Modes of motion, from the swimming bell of a medusoid contracting and expanding in the tide, to that of the lowest vertebrates as illustrated in the pelagic Tunicates, or from the paddling of worm and crustacean to that of fish and frog, duck and seal, are at once familiar adaptations to, and necessary results of aquatic life. Similarly, the smooth and frequently fish-like form, especially of actively locomotive water-animals, is a very noticeable adaptive result of the conditions of life. In the more thoroughly aquatic animals, which have remained in the primitive environment, and have not merely returned to it, the blood is usually purified by being spread out on feathery gills which catch the oxygen dissolved in the water; while in terrestrial forms which have betaken themselves to an aquatic life, the ordinary direct 'air-breathing' is still accomplished at the surface of the water, or in some isolated cases of insects and spiders, by means of the air entangled in their hairs, or even conveyed into their submerged homes. The aquatic respiration of some larval insects, the power that some crustaceans and fishes have of keeping up a respiration on land with a minimum of water about their gills, and above all, the cases of the double-breathing fishes or dipnoi, and of amphibians already referred to, are especially instructive in regard to the problem of transition from one medium to the other. The genuinely aquatic animals are known to have a body temperature not much higher than that of the surrounding

medium, and often survive even the freezing of the water; while in the higher warm-blooded vertebrates which have returned to an aquatic habit, various modifications, such as thick fur and plumage, waterproof varnish, formation of blubber, serve as protections against the cold. The sensitiveness of many forms to changes in the volume, movement, and composition of the water, the importance of the aquatic habit in relation to the dispersion of types, the power exhibited by some of the lower animals in avoiding death or at least extinction during drought, will be discussed in the articles on ENVIRONMENT, DISTRIBUTION, and DESICCATION.

Aquatic Plants. The presence of water is not only essential to the active life of all organisms, but is peculiarly necessary for plants which are for the most part dependent for food-supply on matter dissolved in water, as well as on the carbonic anhydride mingled with the surrounding medium. Numerous plants are, moreover, in the strict sense of the word aquatic, having never acquired or having lost all direct connection with the soil. The simplest plants or Algae are almost all aquatic, though many occur in damp situations on land, or on other organisms, while others remain for long periods quiescent in comparative dryness. Many Algae are absolutely isolated in the water, while others are more or less intimately fixed to some solid substratum. Fungi are very seldom found in water, and lichens are also emphatically terrestrial. Some Liverworts, again, occur floating in lakes, but the majority grow in very damp places, and mark the transition to the generally terrestrial life of mosses and ferns. Some Rhizocarps, such as *Salvinia*, are aquatic, with leaves rising to the surface, while others are land or marsh plants, like the higher horse-tails and club-mosses.

Among the flowering plants or phanerogams, a return to aquatic life is exhibited by numerous, though exceptional cases, while a very large number grow in moist situations, and have a semi-aquatic habit. The simple Monocotyledons known as Helobiæ (q.v.) or marsh-lilies are more or less strictly water-plants. The Arrow-head, q.v. (*Sagittaria*), and other Alismaceæ; the *Butomus* of the marshes; *Hydrocharis*, with floating kidney-shaped leaves; the water-soldier (*Stratiotes*), with narrow submerged leaves; and the Canadian pond-weed (*Anacharis*, q.v.), which, though entirely flowerless in Europe, threatens to choke some canals and lakes, are familiar representatives. The little duck-weed (*Lemna*) floating on the surface of stagnant pools is one of the commonest aquatic Monocotyledons; and the pond-weeds (*Potamoce*) found both in fresh and salt water; the lattice-plant (*Ouvirandra*, see fig. 1), with its skeleton leaves; various estuarine and fresh-water Naiadaceous plants—e.g. *Zostera* and *Najas*, are also common instances, while those growing in marshy ground are much too numerous to mention. Among Dicotyledons, the white water buttercup (*Ranunculus aquatilis*), with its slightly divided floating, and much dissected submerged leaves; the yellow and white water-lilies (*Nymphaea*); the sacred lotus-flower of the Ganges and Nile (*Nelumbium*); the gigantic *Victoria regia* of tropical South America; and the insectivorous bladderwort or *Utricularia*, are among the most familiar aquatic forms.

Numerous modifications have naturally resulted in adaptation to aquatic life. The roots growing out in a relatively frictionless medium may become, as in *Hydrocharis* and *Pontederia* (see ROOT), long and delicate, covered with numerous and uniform root-hairs, which thus expose a large absorbing surface. In *Utricularia*, on the other hand, where the whole plant is submerged with

the exception of the flower-stalk, root-structures are not developed at all. The leaf-stalks of a *Pontederia* growing in the water, show, when contrasted

Fig. 1.

- A, Madagascari Lattice-leaf (*Ouvirandra fenestralis*), showing open fenestrated leaves in adult state, with young leaves at first entire, and showing, as they develop, the progressive rupture of parenchyma between the fibro-vascular bundles ('veins').
B, Leaf of Pond-weed (*Aponogeton*), to show floating type (entire) with same venation as *Ouvirandra*.

with those of another growing on land, an enormous development of air-spaces, which serve to buoy up the floating plant. Submersion seems to increase the surface of leaves at the expense of their thickness, and this in Monocotyledons usually

Fig. 2.

- A, *Pontederia crassipes* of Amazons: ordinary floating form with air-spaces in leaf-stalks, and branched roots.
B, a runner which has taken root on land, and accordingly reverted to the ordinary form of root and leaf-stalk.

results in elongation in one direction (*Sagittaria*, *Vallisneria*, &c.), and in Dicotyledons, in the development of numerous capillary divisions, as in *Ranunculus aquatilis* and *Myriophyllum*. The change may sometimes be experimentally demonstrated by artificial change of environment, while the foliage of *Sagittaria*, *Alisma*, *Nuphar*, &c. is very different, according as the leaves are submerged, floating, or aerial. In aquatic plants, the Stomata (q.v.) are usually absent or scarce on the lower surface of the floating leaves, and on both sides of the submerged; and many more intimate

changes, such as the disappearance of hairs, the occurrence of chlorophyll in the epidermis, and so on, have been repeatedly observed to follow change to an aquatic medium. Some plants, such as *Zostera*, even flower under water, but an exposure and relative drying at the surface has been shown to be in some cases essential to the germination of the seeds. The fruits of the water-lily keep afloat by means of large air-spaces, and those of the arrow-head are protected by a thick oily rind. The whole subject of the adaptive modifications of aquatic plants is obviously a special case of the general problem of the relation between organism and environment, and for further details reference must be made to the separate articles on some of the plants cited as instances, and to ENVIRONMENT.

Aquatint, a mode of etching on copper, by which imitations of drawings in Indian ink, bistre, and sepia are produced. On a plate of copper a ground is prepared of black resin, on which the design is traced; a complicated series of manipulations with varnish and dilute acid is then gone through, until the desired result is attained. The process has fallen into comparative disuse.

Aqua Tofana, a mysterious poisonous liquid, applied to criminal purposes by a Sicilian woman named Tofana, about the end of the 17th century. Many wonderful stories are told of the great efficacy of this poison, but the best toxicologists believe that it was principally a solution of arsenic. See POISONING (*Secret*).

Aqua Vitæ (Lat., 'water of life') is a common term applied to ardent spirits; especially, in commerce, spirits of the first distillation, or unrectified. During the alchemical epoch, brandy or distilled spirits was much used as a medicine, was considered a cure for all disorders, and even got the credit of prolonging life. French *eau de vie* (brandy) has the same meaning, as well as our words *whisky* and *usquebaugh*; the former a Scotch, the latter an Irish form, from a common Gaelic and Irish, *uisge bheatha*.

Aquaviva, general of the Jesuits, was born in 1543 of an old Neapolitan family, and died at Rome, January 31, 1615. Entering the order at the age of twenty-five, he became its head thirteen years later. His principal work was the organisation of the body, and his ordinance regulating the studies of the Jesuits became famous under the title 'Ratio Studiorum' (Rome, 1586). His opinions are still regarded as authoritative by the order.

Aqueduct. This term is perhaps most commonly understood to mean a bridge of stone, iron, or wood, for conveying water across a valley. But a pipe, an open channel, or a tunnel through a mountain is equally an aqueduct, if its function is to convey water from one place to another. All great aqueducts have been constructed for the purpose of conducting water from some more or less distant source to large towns or cities. The term is also properly applied to a bridge carrying a canal for the purposes of navigation.

Roman Aqueducts.—The aqueducts of the Romans were amongst the most magnificent of their works, and the noble supply of water which modern Rome derives from the four now in use, of which three are ancient, gives the stranger a very vivid conception of the vast scale on which the ancient city must have been provided with one of the most important appliances of civilisation and refinement, when nine were employed to pour water into its baths and fountains. The bridge portions of an ancient Roman aqueduct consist most frequently of one row of arches, but sometimes, as in the annexed figure (fig. 1), of two, and occasionally, when the height is great, even of three tiers. Some of these were built of hewn stone and others of brick, but

in nearly every case they were very substantially constructed. Several of them, indeed, after the lapse of two thousand years, have been put in repair and used again as modern aqueducts. The water-channel in one or two of the larger ones is about

Fig. 1.—Aqua Alexandrina.

54 feet high and 4 feet wide. This was, of course, formed in the upper part of the structure, above the arches, and was covered on top, bottom, and sides with a lining composed of lime, sand, and pulverised brick, which in time acquired the hardness of stone. The declivity of these ancient aqueducts was generally about 1 in 200, a much greater slope than is given to modern works of a similar kind. Reservoirs (*castella*) were built at regular intervals along the aqueducts to enable repairs to be made, and to supply water, where necessary, to the inhabitants of the outlying districts.

Of the nine aqueducts which brought water to ancient Rome, three still supply the modern city. (1) The *Aqua Virgo*, now called *Acqua Vergine*, which was restored by Pope Nicholas V. in 1453. This name is said to have originated from a young girl having pointed out the spring at its source to some soldiers. The aqueduct was made by Agrippa, and finished about the year 27 B.C. It mainly consists of a subterranean channel 14 miles in length, and supplies daily about 13,000,000 cubic feet of excellent water. (2) The *Aqua Trajana*, restored by order of Paul V. in 1611, hence its modern name of *Acqua Paola*. It stretches from Rome to the lake of Bracciano, a distance of 31 miles. (3) The *Aqua Marcia*, constructed by the prætor Q. Marcius Rex in 146 B.C. This is 56 miles in length, and is very little shorter than the longest of the ancient aqueducts at Rome. It was restored so recently as 1869, and brings a supply of water from the Sabine Mountains. The noble arches which stretch across the Campagna for some 6 miles on the road to Frascati are a portion of this aqueduct. Besides these three repaired ancient aqueducts, a fourth of comparatively recent date supplies modern Rome. This is the *Acqua Felice*, completed by Sixtus V. in 1585, and largely built of material taken from the arches—about 10 miles in length—of the ancient *Aqua Claudia*. The length of the *Acqua Felice* is some 13 miles, and two-thirds of it is subterranean.

Provincial Roman Aqueducts.—Away from the capital there are a number of ancient Roman aqueducts in Italy itself. The ruins of one exist at Mayence, and of another near Metz, in Germany. France possesses, in the Pont du Gard at Nîmes (fig. 2), erected in the time of Augustus, one of the finest and most perfect of the aqueduct-bridges built by the Romans. It is higher than any about Rome itself, being fully 180 feet in height, and the length of its highest arcade is 873 feet. Spain has also interesting Roman works of this kind at Segovia, at Tarragona, and at Merida. The one at Evora, in Portugal, is still in excellent preservation.

Spoleto Aqueduct.—As forming a link between the ancient Roman structures and the great aqueduct-bridges of modern times, that of Spoleto,

Fig. 2.—Pont du Gard, Nîmes.

about 60 miles to the north-east of Rome, should be mentioned. Erected in the 6th or 7th century, it serves both as a bridge and as an aqueduct, and is a wonderful piece of engineering for its time. The very tall piers are built of a durable stone, and the pointed arches are of brick. It is about 300 feet high, nearly 700 feet long, and the ten great arches have each a span of 66 feet. These are surmounted by a row of much smaller arches carrying the canal of the aqueduct. There exists some doubt as to whether the arches of this very interesting bridge are not of considerably later date than the piers.

Maintenon Aqueduct.—Many centuries elapsed before another aqueduct of special interest or importance was undertaken in Europe. In 1684 Louis XIV. set his engineers to construct an aqueduct to convey the waters of the Eure from Point Gouin to Versailles. Troops to the number of 40,000 were employed in this great undertaking. Thousands of these men died during the progress of the work, which was interrupted during the war of 1688 and never resumed. The bridge at Maintenon, forming part of this aqueduct, even in its incomplete state, is, in point of magnitude, the grandest structure of the kind in the world. The remains consist of forty-seven arches, each 42 feet wide and 83 feet high. The piers are 25 feet 6 inches thick.

Marseilles Aqueduct.—The aqueduct, 60 miles in length, which conveys water from the river Durance to Marseilles, is another magnificent specimen of French engineering. It was finished in 1847.

Croton Aqueducts.—New York is supplied with water from the Croton River, which falls into the Hudson. The aqueduct at present in use was constructed between the years 1837 and 1842. It is 38 miles long, with a declivity for the greater part of its course of 13½ inches to the mile. For a length of 33 miles the water-channel is 8 feet 5 inches in height, and 7 feet 8 inches in greatest breadth. Stone, brick, and cement are used for the encasing masonry, which varies slightly as the channel is formed in rock, or earth, or in an open cutting. In flat valleys the built conduit has sloping earth embankments on each side. When it reaches the Harlem River the water is conveyed in iron pipes over a splendid bridge. These large pipes also connect the receiving and the distributing reservoirs, which are two miles apart.

This first Croton aqueduct, though justly considered one of the grandest modern works of its kind, has been found to be totally inadequate for New York. Accordingly a new aqueduct on a more stupendous scale has been constructed since 1883. A dam of vast size is being built to collect the water of the Croton watershed, and for nearly the whole way—from this to the city, a length of 28½ miles—the conduit or water-channel is being tunnelled through solid rock. For the most part this channel is fully 13 feet both in height and width. A certain length of its more southerly portion, however, is quite circular in section, with a diameter first of 12 feet 3 inches, and then of 10 feet 6 inches.

Manchester Aqueducts.—Very large works were constructed during nine years, ending in 1877, to bring water from Longdendale, between Sheffield and Manchester, to the latter city. In this instance the aqueducts consist for the most part of tunnel and covered conduit, but for 8 miles the water is conveyed in large cast-iron pipes laid along or under the public roads. Before the Longdendale works were finished, the question of a greater supply had to be considered. This led to the adoption of the scheme for bringing water from Lake Thirlmere in Cumberland to Manchester. The distance is nearly 100 miles, and the works were begun in 1886. A tunnel, about 3 miles in length and 270 feet below the surface, forms the first part of the aqueduct, which is large enough to convey as much as 50 million gallons of water per day. Inverted siphon pipes are used for crossing the valleys, and the rivers are crossed by aqueduct-bridges. Cast-iron pipes, respectively 40, 36, and 33 inches in diameter, take the water from Bolton to Manchester. The estimated cost of this scheme is £3,500,000.

Loch Katrine Aqueduct.—Glasgow receives its water-supply from Loch Katrine by an aqueduct about 35 miles long. This great undertaking excited at least as much public interest as any other recent engineering work of the same nature has done. It was begun in 1855, and completed in 1860. The tunnelled portion is 13 miles in length, and is 8 feet high and 8 feet wide, with an inclination of 10 inches in a mile. It is capable of conveying 50 million gallons of water in twenty-four hours. Siphon pipes of cast-iron are laid across the valleys, having an inclination of 5 feet in a mile. The ravines are crossed by aqueduct-bridges of varying character. Where they are deep they are crossed by wrought-iron tubes, 8 feet wide by 6½ feet high, supported by stone piers 50 feet apart. Over small mountain-streams the aqueduct consists of cast-iron troughs, supported on beams of the same material. In those portions of its course where suitable rock is abundant, some of the bridges are of freestone. There is one tunnel at the commencement of the aqueduct, near Loch Katrine, 2325 yards long, and at the other end, near Glasgow, the Mugdock tunnel is 2640 yards in length. The whole system of these waterworks cost about one million pounds sterling.

Liverpool Aqueduct.—Another aqueduct of great magnitude began in 1881 to be constructed for the supply of water to Liverpool from the river Vyrnwy in Wales. Its length from the intended Lake Vyrnwy to the Prescot reservoirs is 67 miles. It will consist partly of tunnel and partly of three parallel lines of iron pipes. The first (Hirnant) of the three chief tunnels is 2½ miles long, 7 feet in diameter, and has a gradient of 1 in 2340.

Vienna Aqueduct.—This is one of the largest aqueducts which has been recently made on the Continent of Europe, and is nearly 60 miles long. It was finished in 1873. The springs are at the foot of the Styrian Alps, and are about 1150 feet above the level of the Danube at Vienna. The size of the section of the conduit or water-way varies, but it nowhere exceeds 6 feet 6 inches in height, by 4 feet in width. At several places in its course there are extensive aqueduct-bridges, and these are built either entirely of stone, or of stone and brick. One of the most important is Baden Bridge, which has forty-three arches. This aqueduct supplies 20 million gallons of water per day. It cost about two million pounds sterling.

Bombay Aqueduct.—A gigantic scheme has recently been determined upon for taking water from the Tansa River, at a point 60 miles from Bombay, into that city. The aqueduct will mainly consist of two lines of cast-iron pipes, 48 inches in diameter, which in this case will lie on the surface of the

ground. There no frost can injure them, and any leakage can be at once seen.

Canal Aqueducts.—Of aqueduct-bridges for carrying navigable canals across rivers or valleys, the finest in Great Britain is that built by Telford over the Dee in Wales. Another fine bridge of this kind, designed by Rennie, crosses the river Lune. In Scotland there is one at Slateford, near Edinburgh, and another over the Kelvin at Glasgow.

Aqueous Humour, the watery fluid which fills the space in the eye between the cornea and the lens. See EYE.

Aqueous Rocks, rocks which owe their origin to the mechanical or chemical action of water. In some systems of classification, the term is synonymous with *sedimentary rocks*. See GEOLOGY.

Aquifolia'ceæ, the holly order, are corollifloral exogens allied to Rhamnaceæ, Celastraceæ, and Ebenaceæ. They are all shrubs or trees, and are chiefly natives of tropical and subtropical America. The most interesting species belong to the genus *Ilex*. See HOLLY, PARAGUAY TEA.

Aquila, the capital of the Italian province of the same name, beautifully situated on the Alterno, near the loftiest of the Apennines, 64 miles S.E. of Terni by a railway opened in 1884. It was built by the Emperor Frederick II. from the ruins of the ancient *Amitemum*, a town of the Sabines, and the birthplace of Sallust the historian. In 1703 it was almost destroyed by an earthquake, in which 2000 persons perished. Aquila, which is a bishop's see, is a busy place, and besides a large trade in saffron, which is the principal product of the surrounding district, the manufacture of paper, linen, and wax is carried on. Pop. (1881) 14,720. The province of Aquila is most picturesque, snow-topped mountains and smiling valleys alternating. Area, 2509 sq. m.; pop. (1885) 371,332.

Aquila, PONTICUS, a celebrated translator of the Old Testament into Greek, born at Sinope. He flourished about the year 130 A.D., is said to have been related to the Emperor Hadrian, and to have been first a pagan, then a Christian, and finally a Jew; submitting in his last conversion to circumcision. His translation of the Old Testament—which appears to have been undertaken for the benefit of his Hellenised countrymen—was so *literal*, that the Jews preferred it to the Septuagint, as did also the Judaising sect of Christians called Ebionites. The version was praised by both Jerome and Origen, and such fragments of it as remain may be found in the latter's *Hexapla* (q.v.).

Aquilariaceæ. See ALOES WOOD.

Aquilegia. See COLUMBINE.

Aquileia (also *Aglar*) is a small town in Austria, at the head of the Adriatic, 22 miles N.W. of Trieste. Pop. about 1400. It is now sunk to utter insignificance, possessing no trade or public buildings of any note, except its cathedral; but in the time of the Roman emperors, it was one of the most important places north of the metropolis, and was a central point of the transit-trade between the north and south of Europe. Founded by a Roman colony in 181 B.C., it was so strongly fortified by Marcus Aurelius, as to be considered the first bulwark of the empire against the northern barbarians. Here the Emperor Maximin perished; and in the vicinity Constantius lost his life in a battle against his brother Constans. When the town was destroyed by Attila (452), it had 100,000 inhabitants. It never recovered, although it was rebuilt by Narses, but slowly dwindled into deeper obscurity. Councils were held at Aquileia in 381, 538, 698, and 1184 A.D.; its bishops called themselves patriarchs, and

claimed to rank next the pope. See Jackson's *Dalmatia* (1887).

Aquinas, THOMAS (or *Thomas of Aquino*), the prince of scholastic theologians, was of the family of the Counts of Aquino, and was born about 1226 in the castle of Rocca Secca, near Aquino, a small town of 3000 inhabitants, half-way between Rome and Naples. He received the rudiments of his education from the Benedictine monks of Monte-Casino, and completed his studies at the university of Naples. A strong inclination to solitude and the religious life determined him, against the will of his family, to enter (1243) the order of Preaching Friars founded by St Dominic, who had been dead twenty-two years. In order to frustrate the attempts of his mother to remove him from the convent, he was sent away from Naples, first to Rome and then to Paris; but his brothers took him by force from his conductors, and carried him to the paternal castle. Here he was guarded as a prisoner for two years, when, by the help of the Dominicans, he contrived to escape, and went through France to the Dominican convent at Cologne, in order to enjoy the instructions of the famous Albertus Magnus (q.v.). According to another account, he owed his release from confinement to the interference of the emperor and the pope. At Cologne he pursued his studies in such silence, that his companions gave him the name of the 'Dumb Ox.' But Albert is said to have predicted 'that this ox would one day fill the world with his bellowing.' In 1248, being 22 years of age, he was appointed by the general chapter of his order to teach at Cologne, together with his old master, Albert. He now began to publish his first works, commentaries on the ethics and the philosophy of Aristotle. In 1252 he was sent to Paris. His masterly application of this philosophy to the systematising of theology, soon procured him a distinguished reputation. It was not, however, till 1257 that Aquinas and his friend St Bonaventura, the Franciscan, obtained their degree of doctor, as the university of Paris, under the influence of William de St Amour, was hostile to the mendicant friars. He vindicated the principles of these orders in an important work; and, in a disputation in presence of the pope, procured the condemnation of the books of his adversaries. He continued to lecture with great applause in Paris, till Urban IV. in 1261 called him to Italy to teach in Rome, Bologna, and Pisa. It was at this time he composed most of his great works.

Even during his life Aquinas enjoyed the highest consideration in the church. His voice carried decisive weight with it; and his scholars called him the 'Angel of the Schools' or 'Angelic Doctor.' A general chapter of Dominicans in Paris made it obligatory on the members of the order to defend his doctrines. Both Urban IV. and his successor, Clement IV., who were much attached to Aquinas, pressed upon him the highest ecclesiastical dignities in vain. So great was his modesty, and his love of poverty and study, that he refused the archbishopric of Naples.

Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew, and was almost equally ignorant of history; but his numerous writings display an intellectual power of the highest order. He gave a new and scientific foundation to many doctrines of his church, especially that of transubstantiation. He also treated Christian morals according to an arrangement of his own, and with a comprehensiveness that procured him the title of the 'Father of Moral Philosophy.' The definiteness, clearness, and completeness of his method of handling theology were such that his *Summa Theologicæ*, which may be said to be the first attempt at a complete theolo-

gical system, remains to this day substantially the standard authority in the Roman Church. Another important work of Aquinas is his *Summa contra Gentiles*, which deals chiefly with the principles of natural religion. His commentaries on Scripture and devotional treatises also have a high reputation. His influence on the theological thought of succeeding ages was immense. At the council of Trent, the *Summa* was honoured with a place on the table by the side of the Bible. It was at Bologna that he began this his greatest work, by which his name will always be connected, but which he never lived to complete. A legend tells how, when engaged in fervent prayer regarding this book, he heard the words from his crucifix: 'Thou hast written well of me, Thomas: what reward dost thou ask?' and he answered, 'None other but Thyself, O Lord.' On December 6, 1273, he was writing at Naples the 90th question of the third part of the *Summa*, when weakness of health compelled him to break off his studies. But Gregory X., who had called a general council to effect the union of the Greek and Latin churches, summoned Aquinas to defend the papal cause at Lyons, where the council was to meet on May 1, 1274. He set out, though suffering from fever, and was surprised by death on the road at the Cistercian abbey of Fossa-Nuova, March 7, 1274. All Europe mourned his loss. Miracles were said to be wrought at his funeral. Universities, religious orders, and princes contended for the honour of possessing his body. It was finally bestowed by the pope on Toulouse, where it was received by 150,000 persons headed by Louis, Duke of Anjou. Aquinas was canonised by John XXII. in 1323, and proclaimed a 'Doctor of the Church' by Pius V. in 1567.

The only scholastic theologian who in any degree rivalled Aquinas in his own age, was the so-called 'Subtle Doctor,' Duns Scotus, of the order of St Francis. The Franciscans naturally followed Scotus, and the Dominicans Thomas, and henceforward medieval theologians were divided into two schools, Scotists and Thomists. The divergencies which penetrate more or less every branch of doctrine depend upon the different systems of metaphysics or scholastic philosophy upon which the theologies were based. The differences concerned the idea of God, the operations of grace and of justification, the mode in which the sacraments take effect, &c. Popularly, Scotism is best known for its advocacy of the Immaculate Conception of Mary, and for the doctrine, with which it is remotely connected, that the Incarnation would have taken place (though of course without suffering or death) if Adam had not sinned. The more recondite peculiarities of Scotist theology and philosophy are now almost entirely confined to the theologians of the Franciscan order. On the other hand, Thomism represents, with few exceptions, the general teaching of the Catholic Church. The school is now not so much opposed by the Scotists as by the eclectic school of Jesuit theology. The first complete edition of Aquinas's works was published in 17 vols. folio at Rome in 1570. They have been frequently reprinted, the latest and best edition having been begun in 1883 under the auspices of Leo XIII. The most convenient edition of the *Summa* is that of Migne (4 vols.). St Thomas was the author of the famous *Pange Lingua* (q.v.), and other eucharistic hymns of the Roman Breviary. See the *Life of St Thomas of Aquin*, by the Very Rev. R. B. Vaughan, O.S.B. (2 vols. 1872); and works by Otten (Paderborn, 1882), Lecoultré (Par. 1883), and Eucken (Halle, 1886).

Aquitania, the Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes, and by Celtic families who settled among them.

Augustus, when he divided Gaul into four provinces, added to Aquitania the country lying between the rivers Garonne and Loire. Afterwards it passed into the hands—first, of the West Goths, and then of the Franks; and during the Merovingian dynasty, became an independent duchy. Gascony, a duchy in the extreme SW., became in 1054, through the extinction of the male line, a part of Aquitania, which had come in the 10th century to be called *Guienne*, a corruption of its original name. In 1137 it was united to the crown of France by the marriage of Louis VII. with Eleanor, heiress of Aquitania. In 1152 it became an English possession, through the marriage of Henry II. with Eleanor, whom Louis had divorced, and it remained an appanage of the English crown until, in 1452, Charles VII. finally united it to France by the capture of Bordeaux.

Arabesque (Fr.), a peculiar kind of fantastic decoration, either sculptured or painted, which the Spanish Moors are supposed to have introduced into modern Europe. But the species of enrichment to which this term is now applied was extensively employed both by the Greeks and Romans, the latter in particular being masters of the style. The Egyptians, from whom the Moors probably derived their original notions of this and other forms of art, also employed it in their monumental decorations. The arabesque of the Moors entirely excluded the figures of animals, the representation of which was forbidden by the Mohammedan religion, and confined itself to the foliage, &c. of plants and trees, curiously and elaborately intertwined. This limitation was again departed from when the decorations were discovered on the walls of the baths of Titus, in the time of Leo X. More recently those in the houses at Herculaneum and Pompeii came to form the models of imitation, and the modern arabesque consists usually of combinations of plants, birds, and animals of all kinds, including the human figure, and embracing not only every natural variety, but stepping without hesitation beyond the bounds of nature. The arabesques with which Raphael adorned the galleries of the Vatican are at once the most famous and the most beautiful which the modern world has produced. See GROTESQUE, ORNAMENTATION.

Arabesque Panel.

at Cordova.)

Arabgir, or ARABKIR (anc. *Anabrace*), a town of Asiatic Turkey, in the province of Sivas, in a mountainous and rocky district, not far from the Euphrates, and on the caravan road from Aleppo to Trebizond. Pop. 30,000, nearly one-fourth Armenians, the rest Turks. It is to the enterprise and industry of the Armenians that the town owes its prosperity. It is specially noted for the manufacture of goods from English cotton yarn.

Arabia—called by the inhabitants, *Jezirat-al-Arab* (the peninsula of Arabia); by the Turks and Persians, *Arabistân*—is the great south-western peninsula of Asia, and is situated 12° 40'–34° N. lat., and 32° 30'–60° E. long. Its greatest length from NW. to SE. is about 1800 miles; its mean breadth, about 600; its area, 1,230,000 sq. m.; and its population conjectured to be not much above 5,000,000. It is bounded on the N. by the highlands of Syria, and the plains of Mesopo-

tamia (or by a line from El Arish on the Mediterranean to the Euphrates delta); on the E., by the Persian Gulf and the Gulf of Omān; on the S., by the Arabian Sea; and on the W., by the Red Sea and the Suez Canal. Midway between Mecca and Medina runs the tropic of Cancer. Ptolemy is supposed to be the author of the famous threefold division into *Arabia Petraea*—i.e. the Arabia of the city of Petra, in the NW.; *Arabia Felix* (an incorrect translation of Yemen, which does not signify 'happy,' but the land lying to the right—i.e. to the south of Mecca, Orientals regarding as the cardinal point not the north but the east), along the W. and SW. coasts; and *Arabia Deserta*, in the interior. The more precise divisions are: the *Sinaitic Peninsula* (see SINAI), between the Gulfs of Suez and Akaba; the *Hedjaz* (the Barrier), the larger and northern strip to the east of the Red Sea; *Yemen*, the southern and smaller strip to the east of the Red Sea; *Hadramaut*, the region along the southern coast; *Omān*, the extreme south-eastern end of the peninsula, as large as England and Wales; *El-Hasa*, along the Persian Gulf; *Nejd*, the Central 'Highlands' of Arabia.

In shape, Arabia is an irregular parallelogram, broadest at the southern end; in character, it is mainly African. The vast central plateau rises from a height of 2500 feet in the north to 7000 feet in the SW., and is bounded by western and southern mountain chains, the former attaining, to the south of Mecca, a height of 8500 feet. Between the mountains and the sea is a low hot strip of land, partially fertile, of varying width. There is a desert in the north of the interior, the mountainous country of Nejd near the very centre, and to the south of Nejd another very sterile sandy desert. Hedjaz and Yemen extend from the Red Sea indefinitely towards the interior, and consist partly of the *Tehama*, or low country, along the sea, and partly of the mountain district beyond. Mecca and Medina, with their seaports Jiddah and Yembo, are in Hedjaz. Yemen is on the whole well watered, has rich and fertile valleys, and contains one-fifth of the whole population of Arabia. Yemen possesses two very important commercial towns, Mocha and Loheia, situated on the coast of the Red Sea. Hadramaut is little known, but resembles the Hedjaz in character. Omān is mainly mountainous, is partly very fertile, and possesses the good harbour of Muscat. It has considerable trade, and some manufactures of cotton, silk, and arms. Hasa is comparatively level and fertile. Large portions of Arabia are perfectly arid; nowhere does a river reach the sea all the year round; but the more fertile portions are so extensive as to constitute two-thirds of the total area: one-third of the whole may be accounted desert and uninhabitable.

Our knowledge of the interior of Arabia is still very imperfect in detail. The largest portion of it lies in that great desert zone which stretches from the shores of the Atlantic to those of the Northern Pacific. Nejd, the northern highland or central plateau of Arabia, is a compact settled district, culminating in the crescent-shaped Jebel Toweik, which is intersected by numerous valleys, roaring torrents during the rains, but dry depressions at other times. North of Nejd, and separated from it by a narrow arm of Nefūd, or the northern desert of Arabia, is the smaller plateau of Jebel Shomer, crossed by the ranges of Jebel Aja and Jebel Selma. The northern desert, partly stony, and partly a burning expanse of red sand, is thinly sprinkled over with oases of wells and grass, serving as halting-places for the caravans of merchants or pilgrims. The oasis of *Jauf*, 60 miles long by 10 miles broad, contains 40,000

settled inhabitants. *Dahna*, the southern and main desert of Arabia, extends from Nejd to the Hadramaut coast-range, and has never been explored by any European. It is, however, an almost absolutely sterile sand-waste. See MUSCAT, ZANZIBAR.

Politically, Hedjaz, Yemen, and El-Hasa are really three Turkish provinces; the Sinaitic Peninsula is in Egyptian hands; England exercises much influence in Hadramaut through her possession of Aden; the Sultan of Omān is independent, and in alliance with England; Nejd, the seat of the once powerful Wahābi State (see WAHABIS), is independent. The Emir of Shomer or Shammar pays a small annual tribute to the Sheriff of Mecca, in recognition of Turkish supremacy.

Arabia has, on the whole, an African climate. Though it is surrounded on three sides by the sea, its mountain chains exclude in a great measure the modifying influence of currents of air from the ocean. In several parts of Arabia hardly a refreshing shower falls in the course of the year, and vegetation is almost unknown: in other sultry districts, the date-palm is almost the only proof of vegetable life. Over large sterile tracts hangs a sky of almost unbroken serenity. The short rainy season which occurs on the west coast during our summer months, fills periodically the *wādys* (hollow places) with water, while slight frosts mark the winters in the centre and north-east. During the hot season, the Simoom (q.v.) blows, but only in the northern part of the land. The terraced districts are more favourable to culture, and produce wheat, barley, millet, palms, tobacco, indigo, cotton, sugar, tamarinds, excellent coffee, senna, and many aromatic and spice plants, as balsam, aloe, myrrh, frankincense, &c. Arabia is destitute of forests, but has vast stretches of desert grass fragrant with aromatic herbs, and furnishing admirable pasturage for the splendid breed of horses. Coffee, one of the most important exports, is an indigenous product both of Arabia and Africa.

In the animal kingdom, an African character prevails generally. Sheep, goats, oxen, camels, and horses are abundant among the settled inhabitants; the wandering tribes have no oxen. Gazelles and ostriches frequent the oases of the deserts, where the lion, panther, hyena, and jackal hunt their prey. Monkeys, pheasants, and doves are found in the fertile districts, and flights of locusts often make sad devastation. Fish and turtle abound on the coast. The noble breed of Arabian horses has been cultivated for several thousand years. The best are reared in Nejd; they never reach the European market. But the most characteristic of all animals in the peninsula is the camel, which has been both poetically and justly styled 'the ship of the desert.' It may be regarded as an Arabian animal, for it seems to be proved that it is not a native of Africa, but has migrated from the peninsula with its master. The camel is not found among the figures of animals in the ancient Egyptian paintings on walls, nor does it appear to have been known to the Carthaginians. The breed of Omān is celebrated for its beauty and swiftness. Among the minerals of Arabia may be mentioned—iron, copper, lead, coal, basalt, and asphaltum, and the precious stones, emerald, carnelian, agate, and onyx. Pearls are found in the Persian Gulf, where, on the island Bahreyn, in the town Bédāa, and on the coast adjoining it, 'all are slaves to one master, Pearl.'

But the most interesting feature of the peninsula is its ancient and peculiar population. The Arab is of medium stature, muscular make, and brown complexion. Independence looks out of his glowing eyes; by nature he is quick, sharp-witted,

imaginative, and passionately fond of poetry. Courage, temperance, hospitality, and good faith are his leading virtues; but these are often marred by a spirit of rapacity and sanguinary revenge. His wife or wives do the work, keep the house, and educate the children.

Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouin, who have, however, their allotted winter and summer camping-grounds, and a strong attachment to their own mode of life, entertain notions of the rights of property differing seriously from those regulating the West; yet even their most marauding tribes are not without a traditional code of law and honour, the only law recognised among them; the enforcing of it is left to every tribesman. The settled tribes, styled Hadesi and Fellahs, are despised by the Bedouin, who scorn to intermarry even with the few artisans that accompany every tribe. The Bedouin are several times outnumbered by the settled population, and therefore must not be regarded as normal Arabs, who are adventurous, commercial, and willing to become sailors. Yet mountain and desert barriers and patriarchal anarchy make Arabia the 'anti-industrial centre of the world,' where passing centuries bring no improvements save such as are forced on it by foreigners. The export of coffee, dates, figs, spices, and drugs, though still considerable, is said to be only a shadow of the old commerce which existed before the circumnavigation of Africa. Arabia has few manufactures, but carries on a transit-trade in foreign fabrics, besides importing these to some extent for its own necessities. Education is mostly confined to that within the household, where, however, a boy is instructed in reading and writing, in grammar, history, and poetry, and where he is trained to habits of politeness and self-restraint. In the few higher public schools, writing, grammar, and rhetoric compose the whole curriculum. The government is patriarchal, and the chief men of the various tribes have the title of Emir, Sheikh, or, in a religious sense, Imam. Their function appears limited to leading the troops in the time of war, to levying tribute, and to the administration of justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been unfrequent both in early and modern times.

History.—The Arabs are of two main races. The one occupying the north half of the country is conveniently called the Ishmaelitic; the other, covering the southern half, is called the Yoktanitic if we use the Hebrew word—the Kahtanic if we use their own—and is in Arabia regarded as the pure old Arab stock. The origin of the Kahtanites is probably African. In prehistoric times they issued from Yemen, the most highly civilised part of the peninsula, in powerful colonies to Oman and Central Arabia.

If blessed is the country that has no annals, peculiarly blessed was Arabia before Islam, for then 'the history of the Arabs was the songs of the bards.' In 24 B.C. Ailius Gallus, prefect of Egypt under Augustus, attacked Yemen unsuccessfully. Trajan appropriated some extreme northern parts bordering on the empire, but they were restored after his death. Persia, too, intruded over the nearest frontier. In the 4th century the Abyssinians invaded Yemen, not for the first time, and they long ruled it. Again, in 529, a large Abyssinian army subdued Yemen, and held their ground for 76 years. But Hedjaz, the Barrier, proved impenetrable against Persia, Egypt, Rome, and Byzantium. The Arabs lived then more after the manner of the Bedouins at the present time, in tents of hair or woollen cloth, following the

pasture, exchanging sheep for what corn they needed; their wealth consisting in camels, sheep, horses, and slaves. Government was not, but sheikhs chosen from certain families led the camps. The usage of blood revenge, calling out the kin of the slain against the kin of the murderer, punished or prevented homicide, and thus precluded alike peace and extermination. Gambling and drunkenness were common. Polygamy, and the husband's absolute power of divorce, the common practice of burying female children alive, and many old proverbs, as 'The best son-in-law is the grave,' illustrate the position of woman. Arabs were incurably prone to pillage, passionately fond of freedom, proud of birth, hospitable, true to their word, true to their tribe or to a tribesman, right or wrong, against the world. Scarcely ever was any tribe at peace with all its neighbours. But one bond of union was the annual fair of Okâdh, near Taif, a day's journey west from Mecca, which lasted all the pilgrimage month, and at which horse races, gymnastic sports, and poetic contests relieved the seriousness of trade. Mohammed, to prevent the feuds kindled by these contests, put an end to the fair. Another bond was the Kâaba, the small rude temple of unknown antiquity at Mecca, wherein the tribal idols were collected. In Mohammed's youth, these numbered 365. Late in the 5th century the Koreish tribe became foremost at Mecca, and guardians of the Kâaba. This post had ever been an object of rivalry and war among the tribes of both north and south, giving not only a religious pre-eminence over all Arabia, but the disposal of the offerings of gold, silver, or of other kinds, accumulated in the temple, a fund which was increased by commerce on the Red Sea coast. To religion, destined to play so decisive a part in Arabian history, Arab nature is not much addicted. Before Islam, the primitive Sabæanisms were forgotten, or miserably degenerate; the tribal idols, stones, fetiches of simplest kinds, and jinns, were worshipped, and Allah, 'the God,' was vaguely acknowledged. But two monotheistic religions had cast roots among the tribes. Many Jews had immigrated into Arabia after the destruction of Jerusalem, and had made many proselytes, especially in Yemen, whither the Abyssinian conquerors had, in the 4th century, brought Christianity. In north Central Arabia this religion had found earlier access. In Mecca, Mohammed was born of the Koreish tribe in 571, the year of the Elephant, when the Abyssinians of Yemen had brought elephants to the unsuccessful siege of Mecca. Taught by the merits and shocked by the corruptions of those two religions, and by the lack of anything better, he, after a while, introduced by the sword his own doctrines, thus forming the grand epoch in Arabian history, and bringing Arabia into close connection with the general history of civilisation. His flight (Hedjrah) in July 622, on being driven from Mecca to Medina, where he gathered his first body of adherents, forms the Moslem era. Now, for the first time, the people of Arabia became united under one sceptre and one creed, and powerful enough to erect new empires in the three quarters of the world: in Palestine, Mesopotamia, and Persia; in Egypt and the north of Africa; in Spain. The dominion of the Arabs, from the time of Mohammed to the fall of the Caliphate of Bagdad in 1258, or even to the expulsion of the Moors from Spain in 1492, is an important period in the history of civilisation (see MOORS, CALIF). But the movements that had such great effects on the destinies of other nations, left the peninsula itself in an exhausted and neglected condition. The monotonous darkness and storms of patriarchal anarchy are broken during the next

thousand years by few events of importance. The invasion of Abu Taher, leader of the Carmathian sect (died 950), from the Euphrates, left no remnant of the califate, and little of orthodox Islam. Arabia was broken up into several independent principalities. The Turks subdued Yemen in the 16th century, and were expelled in the 17th. Oman, during the 16th and 17th centuries, was in the hands of the Portuguese, who held Muscat and other important points on the coast, 1508-1659; of the Dutch, who gained and lost many points; and of the Persians, who were driven out by the native prince Ahmed ibn Sa'ood, in 1759, who thus became Sultan of Oman. About 1760, Mohammed-ibn-Abd-il-Wahhab, in Nejd, came forward as restorer of primitive Islam. The sword of his convert Prince Sa'ood gave the Wahabis dominion from the frontiers of Mecca to the Persian Gulf. After his death, Mecca and Medina were soon added. The Wahabi empire was shattered (1812-18) by Mohammed Ali, viceroy of Egypt, but almost immediately restored itself. Oman, however, had seized the opportunity to regain independence under its native sultan. It is now the most progressive part of Arabia, and contains about 1,500,000 settled inhabitants. Shomer, to a considerable extent Christian, had, in the beginning of the 8th century, successfully resisted the Ommiade (Omayyad) Califs; had thereafter probably become nominally Moslem, then really heathen; was absorbed by the Wahabis, and freed itself when they fell. Its settled population is now about 275,000; the capital is Hayel. The Jowf had been early converted by the sword from some measure of Christianity to Islam; had soon thereafter gravitated into primeval heathenism; became the Wahabi empire's northern limb, and then quietly a province of Shomer. Hasa also freed itself, but, after an obstinate resistance, was reconquered. It is now Turkish. Nejd, the remaining Wahabi domain, has more than a million of settled inhabitants; its capital is now Riad. After Mohammed Ali's short independence, Yemen and the Hedjaz were restored to Turkey by treaty in 1841.

Authorities on Arabia are Pococke, Niebuhr, Burckhardt, Burton, Palgrave, and Welsted.

Arabian Architecture. Before the time of Mohammed, and for long after, the Arabs or Moslems had no special architecture. They were not a temple-building people, but from their intercourse with the western nations they acquired a desire to give their religion a visible embodiment, like the churches of the Christians. Having no architects of their own, they had to engage architects and workmen from Byzantium; and their earliest mosques were thus erected in the style of the late empire, but of course the dispositions of the buildings were adjusted to suit the requirements of their worship. By degrees, the court usually placed in front of the Christian church became enlarged and surrounded with arcades, while the church was diminished in size and importance, and was represented merely by a deeper arcade. Such are the early mosques of Cairo, erected during the first two centuries of the Hedjrah, between 622 and 900 A.D. It is noticeable that in these buildings the arches are all of the pointed form, which seems to have been of very ancient use in the East. This was afterwards modified into the horseshoe shape which is peculiarly characteristic of Saracenic art. Gradually a new and fanciful ornamentation known as Arabesque (q.v.) was added to the recognised features of Greek and Roman edifices. The exclusion of animal figures, which their abhorrence of the very appearance of idolatry necessitated, confined the Mohammedan artists to the imitation of vegetable productions, varied by geometrical patterns

and inscriptions, of which the letters were woven into forms which suited them for architectural uses. At first Saracenic art partook largely of the

styles of the countries into which the Mohammedan religion was introduced, but gradually a style more or less homogeneous was evolved, of which fine examples are found in Persia, India, Africa, and Spain, and of which the influence continues to the present day. In India, this style finds expression in the magnificent tombs of the Tartar rulers, with their wonderful domes and graceful minarets (see AGRA). The gateways are also features of great size, on which much ornament is usually displayed. In Spain, the Moors erected many important buildings, from the mosque of Cordova, begun by Abdel-Rahman in 786, which resembles those of Cairo in general idea, to the Alhambra at Granada, erected in the 14th century during the decadence of the Moorish rule. Many of these structures, although beautiful and elaborate in design, are unfortunately built with brick and stucco, and have yielded to the influence of time. The style of the Moors, after their expulsion from Spain, long continued to influence that of the Christians, especially in the southern part of that country.

Arabian Language and Literature. Regarding the oldest literary culture of the Arabians, we possess but slight information. As far back as Solomon's time, the queen of Sheba (probably *Arabia Felix*) was noted for her skill

in enigmas. The nomadic tribes, living under the patriarchal rule of their sheikhs, possessed everything that was favourable to the growth of a simple and natural poetry. They had quick and vivid feelings, and a rich, glowing fancy, which, operating upon the perils, the hardships, and strange confederate life they led in those barren sand-deserts, and among naked rocks, could hardly fail to call forth a wild and vigorous minstrelsy. Before the time of Mohammed, the Arabians had celebrated poets who sang the feuds of tribes, and the praises of heroes and fair women. During the great fairs at Mecca and Okâdh, poetic contests were held before the people as at the Grecian games; and the poems to which the prize was awarded were re-written in golden characters, and suspended in or on the Kâaba at Mecca, and are therefore termed *Moallakât*, 'suspended.' They are remarkable for their pathos, soaring conceptions, richness of imagery and phraseology, free and unconstrained spirit, and the glow of their love and hate. Among the famous poets of this early period are Nâbegha and others, whose works were translated and published by De Sacy in his *Chrestomathie Arabe*, and Kaab-ben-Zohair, who lived to celebrate the praises of the prophet Mohammed.

But Arabian literature began a new career with Mohammed, though his Korân contains not one precept favourable to literature or science. During the first eighty years of their conquests, when they had extended their dominion from Egypt to India, and from Lisbon to Samarcand, nothing can be said of their culture and refinement. A fanatical desire of conquest prevailed. Gradually, however, the taste for elegant pleasures arose during the repose that followed conquest, and the conquerors served themselves heirs to the civilisation that was perishing around them. With the Abbaside califs, literature, science, and art arose (750 A.D.); when the califate fell (1258), they entered on their decline. They were generously fostered under the splendid sway, first of Almansor (754-75), and afterwards of the celebrated Haroun Al-Raschid (Harûn Al-Rashid, 786-808). Learned men were invited to their courts from many countries, and remunerated for their labours with princely munificence; the works of the best Greek, Syriac, and old Persian writers were translated into Arabic, and spread abroad in numerous copies. The Calif Al-Mamûn, who reigned from 813 to 833, offered to the Greek emperor five tons of gold and a perpetual treaty of peace, on condition that the philosopher Leo should be allowed for a time to give him instruction. Under the sway of the same Al-Mamûn, excellent schools were founded in Bagdad, Basra, Bokhara, and Kufa; while large libraries were collected at Alexandria, Bagdad, and Cairo. In Spain, the high school of Cordova rivalled the literary fame of Bagdad, and generally, in the 10th century, the Arabs appeared everywhere as the preservers and distributors of knowledge. For this period of Arab glory corresponds exactly to that of Europe's deepest darkness, when Italy had no philosopher but the French pope, Sylvester II. (died 1003), whose learning, obtained from the Arabs of Cordova, earned him the name of necromancer. Pupils from France and other European countries then began to repair to Spain in great numbers, to study mathematics and medicine under the Arabs. There were fourteen academies, with many preparatory and upper schools in Spain, and five very considerable public libraries. When 300 volumes were a great library for a rich monastery, the library of the Calif Hakem II. of Spain (died 977) contained, it is said, more than 600,000 volumes. This state of culture, when compared with that prevalent before Mohammed, shows a rapidity of

progress in knowledge almost as remarkable as the career of Arabian conquest.

The Arabs despised the languages of Greece and Rome, abhorred their poets for their heathenism, and disliked their temperate dignity of style; but in science the Arabs were willing learners, and rendered important services. Arabic words still employed in science—such as algebra, alcohol, azimuth, zenith, nadir, with many names of stars, &c.—remain as indications of their influence on the early intellectual culture of Europe. But geography owes most to them during the middle ages. Conquest, widened political connection, trade and the duty of pilgrimage, impelled them to this study. The old Arab treatises on geography, and works of travels in several countries by Ibn Fodhlân (died 921), the fugitive African calif, Edrisi (circa 1153), Ibn Jobair (died 1217), Abulfêda, prince of Hamath (died 1331), Ibn Batuta (died 1377), Albiruni the historian, and others, are still interesting and valuable.

Of what happened in the world before Islam, the Arabs cared to know nothing but the lives of the patriarchs and prophets, and a little of Persian history; but the history of the world after Islam arose was studiously cultivated. After the dawn of the 10th century, history became a favourite study of the Arabs. The first that attempted a universal survey of the subject were Masûdi (died 957), in his *Golden Meadows*; the Persian Tâbari (died 923), whose annals, of great bulk and value, were in 1887 in course of publication by De Goeje and others in Leyden; and Eutychius, Christian patriarch of Alexandria (died 950). These were followed by Abulfâraj or Bar Hebræus, philosopher and also theologian, 'the phoenix of his age'; and George Elmakîn (flourished in Egypt in the 13th century), both Christians; Abulfêda; Nuairi, who wrote a cyclopædia (circa 1331); Makrizi, who wrote the history of Egypt (died 1441), and others. See Wûstenfeld's *Geschichtschreiber der Araber* (1882), and translations by Quatremère.

Arabian theology and jurisprudence are intimately connected, and both founded on the Korân; but are by no means so simple and uniform as is generally supposed. Speculation first began to prevail during the Omniade dynasty, and the Aristotelian philosophy to be studied by the Arabs. As a consequence, the vague statements of the Korân were soon variously interpreted, and a host of sects gradually arose. Of these, four only are regarded as orthodox, leaving not less than seventy-two heretical, whose discordant tenets are stated in the work of Shahrestani (trans. by Cureton, London, 1842). The four orthodox sects arose in the 8th century, and are: the Hanîfites, who do not reject tradition, but subordinate it to reason; the Shâfîtes, who entirely refuse the aids of reason and philosophy in their treatment of theology; the Kambalites and the Mâlechites, who allow speculation on points where there is no tradition. The collection of traditions known as the *Sunna* gives an account of the sayings and doings of Mohammed, and, though pedantic in its details, is in substance more valuable than the Korân. The interpretation of the Korân constitutes the principal part of education in theological jurisprudence. The most celebrated of the commentators are Zamâkshari, rationalistic, and Baidhawî, orthodox. Consult Tornauw, *Das Moslemische Recht* (1885).

Arabian philosophy, which was of Greek origin, held the same relation to the Korân as the Scholasticism of the middle ages did to the Christian Scriptures—that is, it was regarded as the servant of faith. The chief study of the Arabs was the writings of Aristotle, who became known in Spain, and subsequently in all Western Europe, through

translations from Arabic into Latin; though the Arabs themselves only knew the Greek philosopher in translations made during the time of the Abbassides. Especial attention was paid to logic and metaphysics. The most distinguished of their philosophical writers are: the honoured leader, Alkindi of Basra, who flourished about the beginning of the 9th century; Alfarabi, who wrote a work on First Principles in 954; Avicenna (died 1036), who combined the study of logic and metaphysics with that of medicine, and made considerable progress in chemistry, nosology, and medical botany; Alghazali (died in Bagdad, 1111); Abubekr-ibn-Tofail (died in Seville, 1190); and his pupil, Averroes, greatly esteemed as an expositor of Aristotle. For an account of these men and their systems, see *Sur les Écoles Philosophiques chez les Arabes*, by Schmolders (Paris, 1842); and Rénan's *Averroès et l'Averroïsme* (1850).

Many of these illustrious Arabian philosophers were also physicians. The science of medicine is essentially a creation of the Arabs, to whom the oldest sources of knowledge—that of the Indian physicians—had been early opened. Chemical pharmacy (see ALCHEMY) was created by the Arabs. Pharmacy and *materia medica* naturally led to botany and chemistry. For three centuries—from the 8th to the 11th—a rich scientific culture prevailed. Schools of philosophy and medicine sprang up at Jondisahur, Bagdad, Ispahan, Firuzabad, Bokhara, Kufa, Basra, Alexandria, Cordova, &c. In all departments of medical science a great advance was made, except in anatomy (the Koran forbidding the dissection of human bodies). The most famous writers on medicine are Razi of Bagdad (died 922); Alkindi; Avicenna (980–1037), who wrote the *Canon of Medicine*, for a long time the only handbook on the subject; Abulkasem of Cordova (died 1107); and Averroes (1126–98), who wrote a complete system of medicine.

In mathematics, the Arabs made great advances by the introduction from India of the numerals and mode of notation now in use, of the sine instead of the chord in trigonometry (thanks to Albatani), and of a more extended application of algebra. While alchemists, searching for the elixir of life and the philosopher's stone, were founding chemistry, astrologers were enriching astronomy, which was zealously studied in the famous schools and observatories of Bagdad and Cordova. Alhazan wrote upon optics. The *Almagest* or System of Astronomy by Ptolemy was translated into Arabic as early as 812. In the 10th century, Albatani, the greatest of Arabian astronomers, a Sabeian by religion, and born in Haran (died 929), observed the advance of the line of the apsides in the earth's orbit. Abul-Hassan-Ali wrote on astronomical instruments in the 13th century.

Besides these advances in the solid branches of knowledge, the genius of the Arabs continually flowered into poetry. Numerous poets sprang up in all lands where the children of the desert had carried their irresistible faith. Their verse, however, was not like the rude, simple minstrelsy of a purely patriarchal people; it gradually allied itself to the prevailing culture, and took, especially in the golden epoch of Arabian civilisation, a highly artistic form. None have been more highly esteemed than Motanebbi (killed 965) and Abutemam (died 845), who compiled the old poems that compose the Hamasa. Famous, too, are the satirist Abul-Old (died 1057), the Egyptian Busiri, whose *Bordah* is a eulogy of Mohammed, and two Syrians, El-Rumi (died 896) and the profound Ibn Farid (died 1235; his *Dicān* was published at Beyrout, 1874). Hamadani (died 1007) introduced novels in rhyming prose like that of the Koran, and wrote four hundred of them

under the name of *Maqamat*. Hariri (died 1121) brought this form of literature to perfection. Azzeddin (died 1279) wrote an ingenious allegorical poem, 'The Birds and the Flowers.' Besides these, a singularly wild and fantastic prose literature made its appearance, in which the craving for the wonderful and gorgeous, so characteristic of the restless, adventurous Arabs, was richly gratified. Romances and legendary tales abounded. The most famous of these are: *The Arabian Nights' Entertainments* (q.v.), *The Exploits of Antar* (pub. Bulak, 1869), *The Exploits of the Champions*, and *The Exploits of Bidrs*. The taste for proverbs, fables, and biography was extensively indulged. In fact, with the exception of the drama, condemned by the Prophet, there was no sort of literature that the Arabs did not attempt. The trouvères of Northern France, the troubadours of Provence, the inspirers of Italy, and the romancers of medieval Europe owed much to the Arabs, whose influence on modern literature still endures. The tales of fays, charms, sorceries, and the whole gorgeous machinery of enchantment, passed into the poetry of the West. During the middle ages of European history, several of the most popular and widely-spread books came from or through the Arabs; such as *The Seven Wise Masters*, and *The Fables of Bidpai* (q.v.), though the Arabians themselves borrowed largely from the Persian stories and the Greek fables. See Clouston's *Arabic Poetry for English Readers* (Glasg. 1881).

All this culture of the early ages of Mohammedanism presents a strong contrast to the ignorance which now prevails among the Arabs. The brutal fanaticism of the Turks nipped the blooming promise of the East; sunk in stupid indolence, the peoples await in apathetic resignation their deliverance and return to higher modes of life. Literature furnishes now nothing worthy of notice. Learning spends itself principally in commentaries and scholia, in scholastic discussions on the subject-matter of dogmatics and jurisprudence, and in tedious grammatical disquisitions concerning the old Arabic speech, generally acute and subtle, but always unprofitable and unenlivening. The swift and mobile genius of the East has departed, and pedantic dullness has usurped its place. There are 'Dryasdusts' even in the desert. A few modern writers have attempted, with more or less success, to imitate European forms of thought and sentiment. Of these may be mentioned Michael Sabagh of Syria; the Sheikh Refaa of Cairo; Nasif-Effendi of Beirut, who wrote the critical observations in De Sacy's edition of Hariri (*Epistola Critica*, Leip. 1848); B. Bistani in his cyclopædia (Beirut, 1875).

The Arabic also possesses a Christian and Jewish literature, which, however, is chiefly ecclesiastical. Its principal ornaments are Eutychius, Elmakin, and Abulfaraj. Translations of the Old Testament were made, not from the Hebrew, but from the Septuagint, or from Latin versions. In the middle ages, the Spanish Jews employed Arabic for their learned compositions; and several of the most important works of Moses Maimonides, for example, were originally written in that tongue. Consult on Arabian literature, D'Herbelot's *Bibliothèque Orientale*; Kremer's *Kulturgeschichte des Orients* (1875–7); Zenker's *Bibliotheca Orientalis* (1846–61); and Ibn Ishaq's *Kitab-al-Fihrist*, the oldest Arab cyclopædia of literature, of about 1000 A.D., published by Flügel (2 vols. Leip. 1871–2).

The Arabic language, it has been remarked, is at once both rich and poor. It is necessarily destitute of innumerable words describing those ideas and objects which only civilisation can develop or produce; but, on the other hand, the rich and nimble fancy of the Arabians has multi-

plied, to an almost incredible extent, the synonyms of their desert-tongue, so that in some cases hundreds of expressions are found for the same thing. The Arabic belongs to the so-called Semitic family of languages, among which it is distinguished for its antiquity and soft flexible grace. Through the Korān, the dialect of an Ishmaelitic tribe, the Koreish, became the predominant language of literature and commerce throughout the whole extent of the Arabian dominions. The Himyaritic from Abyssinia, and closely akin to the ancient Ethiopic, is known as yet only by a few inscriptions, &c. Arab poems till 750 consisted mostly of from two to one hundred and twenty lines of one rhyme. Thereafter was developed an exact and complex prosody. Al-Jauhari, who died in 1009 A.D., drew up a dictionary of the pure Arabic speech, which he entitled *Al-Sihah* ('Purity'), and which is held in high estimation to this day. Mohammed-ben-Yakūb-al-Firuzabādi, who died in 1414, was the author of an Arabic Thesaurus, entitled *Al-Kāmds* ('The Ocean'), which is the best lexicon in the language, and has consequently been translated into Persian and Turkish. Jordshani has explained, in alphabetical order, the meaning of the technical terms used in Arabic art and science. His work was published by Flügel (Leip. 1845), under the title of *Definitiones*. Meidāni made a large collection of Arabic 'saws,' apophthegms, &c., which was published by Freytag (Bonn, 1838). Through the conquests of the Arabs in Sicily and Spain, their language became known in Europe; but notwithstanding the numerous traces of its influence in various European tongues, it became forgotten after the expulsion of the Moors from Spain. The first European scholars who earnestly took up the subject were the Dutch, in the 17th century; after them, the Germans, French, and English. The more learned theological students consider it a necessary part of their education. Maltese is an Arabic dialect, akin to the Mozarabic of the Spanish Moors. In Turkish plainly, and even in Malay, the traces of Arabic appear. In Persian every fourth, and in Hindustani every fifth word is Arabic. In recent times the purely negro population of the central and western Sudan have, in receiving Islam, made considerable progress in civilisation and the knowledge of Arabic. The Arabic language is never printed but in the ancient classical form, of which the Korān is regarded as the unapproachable standard. Classical Arabic is spoken in northern Central Arabia, differences increasing with distance. Elsewhere the language has lost, as Hebrew had lost before the oldest books of the Bible were written, the final vowels distinctive of case in nouns, and person in verbs. Egyptian or Syrian Arabic is less pure than the native, but more pure than the Arabic spoken from Tripoli to Morocco. Wright's *Arabic Grammar* (new edition) is one of the best extant; Lane's *Arabic-English Lexicon* is a standard work; and Badger's *English-Arabic Lexicon* (1881) is also excellent. The grammatical and lexicographical works of Caspari, Freytag, Fleischer, and De Sacy, are most important. See SEMITIC LANGUAGES.

Arabic Writing.—Like all Semitic writing, this proceeds from right to left. It is borrowed from the old Syriac, and was probably introduced into Arabia by Christian missionaries about the time of Mohammed. In its oldest form it is called Kufic, from the town of Kufa, on the Euphrates, where the transcription of the Korān was busily carried on. Its characters are rude and coarse, and it has particular symbols for only sixteen of the twenty-eight Arabic consonants. This writing, nevertheless, continued to be employed for 300 years, and for coins and inscriptions even later; but in the 10th

century it was displaced for common purposes by a current handwriting, the *Neskhi*, introduced by Ibn Mokka. This is the character still in use, more or less modified, by all nations that have adopted the Mohammedan religion. In it, the consonants which resemble each other are distinguished by points, and the vowels by strokes over and under the line; but in writing and printing, the vowels are commonly omitted.

The following passage, the translation of John iii. 16 as published by the British and Foreign Bible Society, will show the character (see also ALPHABET, p. 188). It may be thus transliterated: *Liannahu hakatha ahabb Allah el'alam hatta bathal ibnahu elwahul lkai la yahlik kull man yu'min bihi bal takun lahu elhayyat elabadiyat.*

لأنه هكذا أحب الله العالم حتى بذل ابنه
الوحيد لكي لا يهلك كل من يؤمن به بل تكون
له الحياة الأبدية.

Arabian Nights' Entertainments (*Alf Laylah wa Laylah*, 'A Thousand Nights and a Night'), in Christian lands, the best known product of Arabian literature. The name and plan of this work are very ancient. Masūdi in his famous history, *Golden Meadows*, written in 943, mentions the Persian Hezār Afsāne, translated into Arabic with the name *A Thousand Nights and a Night*. Mohammed-ibn-Ishāq, in his work *Al Fihrist*, written in 987, mentions the Persian work as well known to him, and as containing about two hundred tales divided into a thousand nights. He thus relates its origin. A Persian king used to marry a new bride every day, and put her to death next morning. One wife was Shahrazād (Scheherazade), who had understanding and discretion. As they sat together she began a tale, and late at night she broke it off at such an interesting point that the king next morning spared her life, and at night begged her to continue her tale. So she did a thousand nights. Meantime she bore him a child. Presenting the child to him, she told him of the craft she had used; and the king, whose love she had now gained, admired her policy and let her live. Mohammed adds that the book was written for the Princess Homai, daughter of Bahman Artaxerxes, and that it had been translated into Arabic with alterations, some new tales being substituted for old.

The much-befabled Princess Homai is half mythical, like the Babylonian Semiramis, an accredited doer of many things whose author is unknown. Masūdi tells that her mother was a Jewess whom Bahman had married, and who delivered her people from bondage: in short, she was the Esther of Israelitic tradition. But Persian poets and Arabian historians do not make it clear whether the name Shahrazād belonged to the mother or the daughter. Tābari calls Esther the mother of Bahman Artaxerxes (Longimanus); this is implied in the biblical story, as Ahasuerus seems to be Hebrew for Xerxes.

The occasion of the book written for the Princess Homai resembles the story told in the Hebrew Bible about Esther, her mother or grandmother, by some Persian Jew two or three centuries B.C. The likeness is closer between the biblical story and that of Shahrazād as it appears in the Arabian Nights, the surviving representative of the Persian *Thousand and One Nights*. In both, the Persian

king is offended with his queen; from the Persian book we cannot tell why; in the Hebrew, because she has insulted him at a banquet before his princes and lords; in the Arabian, for a fouler reason. In all three, thereafter, the king has a new wife daily. The Persian and the Arabic consign her next morning to death; the Hebrew merely to the seclusion of the harem. All three tell that the king at length honoured as queen the one that gained his lasting love; the Arabic makes her the grand-vizier's daughter; the Hebrew, the vizier's foster-daughter. The Persian ascribes to her her people's deliverance from bondage; the Hebrew, their salvation from massacre; the Arabic originates her hardy resolution to marry the blood-thirsty king in her zeal to save the daughters of her people. In all three the king is charmed at night with recitals from the past. In the Persian story she is aided by the king's housekeeper, in the Arabian by her own sister, in the Hebrew by the king's chamberlain.

A quotation by Makrizi from Ibn Saïd of about 1250, mentions the *Thousand and One Nights* as a romantic work. Meantime the work seems to have, in the course of centuries, had the experience of a celebrated pair of hose which lost their identity by universal patching, and to have been edited into its present form about 1450 in Egypt, and most probably in Cairo. How much of the Princess Homai's book remains in it we cannot tell, nor where to look for this remainder. The Persian origin of some of the tales is evident; equally evident the Indian origin of others, notwithstanding the location in Bagdad, and the presence of the Calif Haroun Al-Raschid. But in a great part of the work both form and matter appear to be Arabian. The foundation of many tales in history or legend or older tales limits their age. The story of the city whose inhabitants are turned into fishes, the Christians into blue, the Magians into red, the Jews into yellow, the Moslems into white, cannot well be older than the year 1301, when the sultan of Egypt, to distinguish true believers from infidels, ordered Christians to wear blue turbans, and Jews yellow, while white turbans were reserved for Moslems alone. The story told by the purveyor of the sultan of Cashgar is taken, and considerably spoiled in the taking, from the Chronicle of Ibn-Al-Jauzi, who died in 1200. It is the story of Qamar, slave of the princess mother of Al Moqtadir, who was calif from 910 to 932. Others are traced by Mr Lane.

The *Thousand and One Nights* has never been patronised or protected by the literary classes of the East. The puritanical spirit of high Mohammedan literature demands an apology from any merely entertaining author for not better employing his time. The *Thousand and One Nights* accordingly bears the penalty of being neither religious nor scientific. Its style is mean; it has been much handed about in fragments among the comparatively uneducated; told by professional story-tellers so as to suit the rough audiences of Eastern towns; and copied from such men's dictation, individual taste or fancy filling many a blank.

Various editions differ considerably in the telling and order of the stories. The best are the not well-printed Bulâq edition, the very similar but well-printed Calcutta edition of 1839, and the Breslau edition. No MS. appears to be older than 1548, the date of that used by Antoine Galland. His French translation, published in Paris, 1704-8, in 12 vols., was long supposed to be the fruit of his own imagination. It much misrepresents his original, and the Eastern life. Rendered into English, it is the most popular form of the *Thousand and One Nights* in Britain. He inserted into it ten tales of unknown origin; but in 1887

Burton found the Arabic text of two of these (including Aladdin) in a Parisian library. In 1840 E. W. Lane, prepared by several years spent in Cairo entirely among Arabs in the Arabian manner, published his scholarly translation, in which he has sacrificed the coarseness of the original and much of its wearisome length. His notes are admirable, and often as delightful as the text. Payne's translation, complete but not very accurate, was published for subscribers in 9 vols. 1882-4. Sir Richard Burton's varied learning and rare mastery of English and Arabic make his translation, printed for subscribers in 10 vols. (at 'Benares,' 1885-87), a vigorous and uncompromisingly accurate representation of the original. Five supplementary volumes were added subsequently. Lady Burton's expurgated edition of her husband's work is in course of publication (1887). See M. J. De Goeje on the whole subject in *De Gids*, September 1886.

Arabian Numerals or CIPHERS—the characters 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Properly, they should be styled Hindu or Indian Numerals, for the Arabs borrowed them, along with the decimal system of notation, from the Hindus, probably in 773 A.D. Gerbert (afterwards Sylvester II.) seems to have learned the use of them from the Moors in Spain about the year 970. Yet their employment was long in making its way, and was not general before the invention of printing. Accounts continued to be kept in Roman numerals up to the 16th century. See NUMERALS, ALPHABET.

Arabian Sea, the *Mare Erythræum* ('Red Sea') of the ancients (though these terms appear to have been applied with considerable vagueness), is that part of the Indian Ocean which lies between India on the east and Arabia on the west. Its most natural and convenient limit on the south is a line drawn from Cape Comorin to Cape Guardafui. Its two great arms are the Red Sea proper and the Persian Gulf.

Arabin is the essential principle of gum-arabic, and is obtained pure by adding alcohol to a solution of gum-arabic in water, when the arabin is precipitated in white flocculi. See GUM.

Ara'bi Pasha, leader of the military and insurrectionary party in Egypt in 1882. See EGYPT.

Aracan. See ARAKAN.

Aracari, a genus of birds closely allied to the Toucans. See TOUCAN.

Aracææ. See ARUM.

Arachis. See GROUND-BEAN.

Arach'nida (Gr. *arachnê*, 'a spider'), a subclass of Tracheate Arthropoda (q.v. under ARTICULATA), including scorpions, spiders, mites, &c., and first separated by Lamarck from the Insecta of Linnæus. The body is usually divided into cephalo-thorax and abdomen, the latter destitute of appendages, the former possessing six pairs, of which the posterior four pairs are walking limbs, thus furnishing a ready means of distinction from insects, which have three pairs only. The two anterior pairs, known as chelicere and pedipalpi, are of various forms, the former usually chelate or sub-chelate; the latter chelate, ambulatory, or antenniform. Respiration is effected by means of tracheal tubes, or by pouches—the so-called respiratory sacs.

Those arachnida with segmented abdomen are termed Arthrogastra, and include five families, of which Scorpio, Thelyphonus, Chelifer, Galeodes, and Phalangium are types. These show a distinct gradation to true spiders or Araneina, which are easily recognised by their unsegmented abdomen, usually furnished with spinning glands, opening by four to six posterior papillæ, and by their sub-

chela te chelicerae and ambulatory pedipalpi. The mites and ticks (*Acarina*) have the unsegmented abdomen continuous with the thorax, and the chelicerae and pedipalpi are modified into a sucking or piercing apparatus. The *Linguatulida* (*Pentastomum*), the *Tardigrada*, and the *Pycnogonida*, have usually been reckoned as highly modified arachnides, somewhat akin to the *Acarina*; the most recent anatomists, however, tend to remove them from the arachnida altogether. On the other hand, it has lately been clearly shown that the Silurian *Eurypterida*, and the ancient, but still persistent *Limulus* (see KING-CRAB), must be reckoned rather as arachnides than as crustaceans, and thus the two great divisions of the *Arthropoda*, the *Tracheata* and the *Branchiata*, are shown to have diverged in paleozoic times. See ACARINA, MITE, SCORPION, SPIDER, and TICK; also Huxley's *Anatomy of Invertebrated Animals*, Bal-four's *Comparative Embryology*, and Cambridge's monograph in *Encyclopædia Britannica* (9th ed.).

Arach'noid Membrane, one of the three coverings of the brain and spinal cord, is situate between the dura-mater and the pia-mater. It is non-vascular, transparent, and remarkably thin. Its outer surface, next the dura-mater, is free, smooth, and glistening; its inner surface is connected to the pia-mater by numerous delicate threads, which traverse the space (sub-arachnoid) between the two membranes. Some anatomists regard the space between arachnoid membrane and dura-mater (sub-dural) as a serous cavity bounded by a serous membrane, of which the arachnoid membrane is its visceral layer, and the inner free shining surface of the dura-mater its parietal layer. The sub-arachnoid space contains a fluid named cerebro-spinal, which in health varies in amount from two drachms to two ounces. See BRAIN, CEREBRO-SPINAL FLUID, PIA-MATER.

Arad, capital of a district in Eastern Hungary, is situated on the right bank of the Maros, an affluent of the Theiss, and has a population (1880) of 35,556, including many Jews. It is an important railway centre, and is 95 miles SE. of Buda-Pesth, and 74 miles E. of Szegedin by rail. It carries on a large trade in corn, spirits, wine, and tobacco, and is one of the greatest cattle-markets in Hungary. During the 17th century it was often captured, and at last destroyed by the Turks. During the revolutionary war of 1849 it was occupied for a time by the Austrians, who capitulated to the Hungarians in July. In August, Arad was surrendered to the Russians by Görgei; many of the prisoners were massacred; and in October, thirteen Hungarian officers were executed here by order of the infamous Haynau.—NEW ARAD, on the other side of the river, has 5000 inhabitants, including many Germans.—The county or province of Arad has an area of 2490 sq. m., with a pop. of (1881) 303,964. It borders on Transylvania, and produces much excellent wine; the inhabitants are chiefly Roumanian in race.

Aræom'eter. See AREOMETER.

Araf, the purgatory of Islam, the place between Paradise and hell. Its position has not been defined with the usual exactness of Mohammed, but it is undoubtedly a place of purification by fire.

Ar'afat, MOUNT, *Orphat* or *Jebel-er-'rahme* ('mountain of mercy'), is a granite hill about 15 miles SE. of Mecca, visited by the faithful, and believed to be the spot where Adam, conducted by the angel Gabriel, met again his wife Eve, after a punitive separation of 200 years, on account of their disobedience in Paradise. It is not above 260 feet high, but its circuit is a mile and a half.

Arago, FRANÇOIS JEAN DOMINIQUE, a celebrated French astronomer and physicist, was born

February 26, 1786, at Estagel near Perpignan, in the department of Pyrénées Orientales. At the early age of seventeen, he entered the Polytechnic School at Paris, and in 1804 became secretary to the Observatory. Two years afterwards he was engaged, with Biot, by the French government, to carry out the measurement of an arc of the meridian, which had been commenced by Delambre and Méchain. Arago and Biot had to extend it from Barcelona to the Balearic Isles. The two savans established themselves on the summit of Mount Galatza, one of the highest of the Eastern Pyrenees, and here they lived for many months. War broke out betwixt France and Spain, and Arago was held to be a spy; his signals, supposed to be meant to guide the French invading army, were interrupted; and with great difficulty he succeeded in reaching Majorca. Having gone to Algiers, he was captured, on his way back to France, by a Spanish cruiser; and it was not till June 1809 that he finally arrived at Marseilles. As a reward for his sufferings in the cause of science, he was elected a member of the Academy of Sciences, though only twenty-three years of age, and was appointed professor of Analytical Geometry in the Polytechnic School.

His laurels were, however, won mainly in the fields of astronomy, magnetism, and optics. In 1812 he commenced his extraordinary course of lectures on astronomy and cognate subjects, which fascinated all Paris. In 1816, along with Gay Lussac, he established the *Annales de Chimie et de Physique*, and confirmed the truth of the undulatory theory of light. In 1818 he published his *Recueil d'Observations Géodésiques, Astronomiques, et Physiques*, and, with Biot, made geodetic observations on the coasts of England and Scotland. In 1820 he made several important discoveries in electro-magnetism—especially the phenomenon of *rotatory magnetism*. He may be said to have proved the relation between the aurora borealis and magnetic variations. He greatly promoted the acceptance of the undulatory theory of light, and made important advances in the doctrine of the polarisation of light. Other minor achievements were made in the department of photometric measurements of the brightness of the stars, the elastic force of steam and other gases. In 1830 he became chief director of the observatory, and received the post of Perpetual Secretary of the Academy. It was while holding the latter office that he wrote his famous *Éloges* of deceased members. He took a prominent part in the July revolution (1830). Elected by Perpignan as member of the Chamber of Deputies, he occupied a position on the extreme left. In the revolution of 1848, he was chosen a member of the provisional government, and in this position he resisted the proposed measures of the Socialist party. Arago opposed Louis Napoleon, and refused to take the oath of allegiance after the *coup d'état* of 1852. He died 3d October 1853, and was honoured with a public funeral. His works were edited by Barral (17 vols. 1854–62), including the *Astronomie Populaire* and the *Notices Biographiques*. See Audiganne's *Arago, son Génie et son Influence* (2d ed. 1869).

JACQUES ÉTIENNE VICTOR ARAGO, brother of the great savant, was born 10th March 1790. In 1817 he accompanied an expedition round the world. Afterwards, we find him first at Bordeaux, and then at Toulouse, writing vaudevilles, besides publishing poems and romances. From 1835 to 1837 he managed the theatre at Rouen. His *Promenade autour du Monde* (1822), and *Souvenir d'un Aveugle* (1838), are well known. In 1849, though blind, he formed a company of speculators, and departed for California, to search for gold.

On his return he published *Une Vie Agitée* (1853). He died in Brazil in January 1855.—ÉTIENNE, another brother of the astronomer, was born 9th February 1802, and made himself well known as a popular author. He held an appointment under the provisional government of 1848, and was afterwards exiled. In 1859 he returned to France. In 1878 he became archivist in the *École des Beaux Arts*.—EMANUEL, son of the astronomer, born 1812, became known as a zealous republican in 1848, and was after 1852 active as a barrister. In 1870 he became a member of the committee of national defence, and afterwards held appointments under the government.

Ar'agon, once a kingdom, now divided into the three provinces of Saragossa, Huesca, and Teruel, in the N.E. of Spain. Greatest length from north to south, 190 miles; breadth, 130. Area, 17,980 sq. m. Pop. (1884) 925,920. It is bounded on the north by the Pyrenees, and borders on Navarre, the Castiles, Valencia, and Catalonia. The Ebro flows through Aragon in a south-easterly direction, receiving numerous tributaries both from the lofty regions of the Pyrenees and from the Sierras in the south. The province is naturally divided into the level country along the Ebro, and the northern mountainous district of Upper Aragon. The central plain is sterile, poorly supplied with water, and intersected by deep ravines. The valleys of Upper Aragon are at once the most beautiful and fertile of all the Pyrenean valleys. The Spanish Pyrenees, which attain a height of over 11,000 feet, are rich in grand scenery, and afford good sport for the angler and sportsman. The slopes of the hills are clothed with forests of oak, beech, and pine. The minerals of the province are copper, lead, iron, salt, alum, saltpetre, coal, and amber. The silk-worm industry has been introduced. Aragon is peopled by a brave, active, enduring, but obstinate race, high-spirited and patriotic, making good soldiers or audacious robbers. It early became a Roman province; and, on the fall of the empire, passed into the hands of the West Goths, but was conquered by the Moors in the beginning of the 8th century. The rulers of Aragon, after it had been recovered from the Moors and united with Catalonia (1137), became powerful; obtained possession of the Balearic Isles in 1213, of Sicily in 1282, of Sardinia in 1297, and of Naples in 1440. By the marriage of Ferdinand of Aragon with Isabella, heiress of Castile, in 1469, the two states of Aragon and Castile were united, and formed the foundation of the great Spanish monarchy. After Ferdinand's death in 1516, the union of the states was made permanent. The constitutional history of Aragon is peculiarly interesting for the stout defence of popular rights maintained by its cortes; even after the union with Castile, the old privileges were maintained. In the war with the French, 1808-9, Saragossa, the capital of Aragon, was remarkable for its heroic defence under Palafox. The chief towns are Saragossa, Calatayud, Huesca, and Teruel.

Arag'ona, a town of Sicily, 6 miles NNE. of Girgenti by rail, with the old castle of the princes of Aragona. Near it are important sulphur-mines. Pop. (1881) 9571.

Aragonite, a mineral essentially consisting of carbonate of lime, and so agreeing in chemical composition with Calcareous Spar (q.v.), but differing from it in the form of its crystals, of which the primary form is a rhombic prism with angles of 116° 18' and 63° 44', the secondary forms being generally prismatic and pyramidal. The effect of heat on them shows another difference, aragonite being reduced to powder by a heat in which calcareous spar will remain unchanged. Aragonite

appears to be the product of a crystallisation taking place at a higher temperature than that in which calcareous spar is produced; and accordingly it is frequent in volcanic districts and in the neighbourhood of hot springs, as at Carlsbad. It is frequently found filling cavities (see AMYGDALOID), and lining cracks, joints, and other natural fissures in such igneous rocks as basalt and its varieties, porphyrite, &c. as in Scotland. It derives its name from the province of Aragon in Spain. It sometimes occurs in stalactitic form. Its crystals are sometimes prisms shortened into tables, sometimes they are lengthened into needles. Twin crystals (*maclés*) are very common. *Satin spar* is a variety of it, in which the crystals are of a fine fibrous silky appearance, and combined together into a compact mass. *Flos ferri* (i.e. flower of iron) is a name given to a coralloidal variety which sometimes occurs in iron mines.

Araguay', a large river of Brazil, rising in the Sierra Sciada, and flowing 1000 miles northward, till, at San Joao, it joins the Tocantins, which again, after a northerly course of 300 miles more, mingles its estuary with that of the Amazon round the Isle of Marajo.

Ar'akan (*Arakan*; also spelt *Aracan* and *Arracan*), long the most northerly division of British Burmah, is a narrow strip of territory on the Bay of Bengal, between Pegu and Chittagong, in Lower Bengal. Its length is about 400 miles, while its breadth varies from 90 miles in the north to about 15. The area is 14,526 sq. m. A range of mountains, nearly parallel with the line of coast, the highest point 7000 feet above the sea-level, separates Arakan from Pegu and Upper Burmah. The soil of the northern portion of Arakan is alluvial; but the country is hilly, difficult of access, and covered with forest. The province is divided into four districts—Akyab, Sandoway, Kyauk-Pyou, and North Arakan, or the Hill Tracts. At its annexation in 1826, the population was only about 100,000; in 1831, it was 173,000; in 1839, it had increased to 248,000; in 1872, 483,363; and at the census of 1881, 587,518. With these results the state of trade fully corresponds. Rice is the chief article of exportation, the others are cotton, tobacco, sugar, hemp, indigo, betel-nuts, and timber, especially teak. The imports consist mainly of British manufactures.

The native princes of Arakan, whose history is traced back to the 8th century, once ruled over a much wider area. The old capital, Arakan, now called Mro-houng ('old town'), is situated 50 miles from the sea, in a very unhealthy district. It was the capital of a kingdom for 350 years, and its massive ruins of forts and walls still point to its former greatness. But its population now is hardly more than 2000 souls. The modern capital of the province is Akyab (q.v.). The Arakanese belong to the Burman stock, and are Buddhists, though there are a few immigrant Mohammedans.

A'ral, LAKE, separated by the plateau of Ust-Urt from the Caspian Sea, is the largest lake in the steppes of Asia. It lies wholly within the limits of Russian Central Asia, embracing an area of about 24,000 sq. m. It is fed by the Sir-Darya (the ancient Jaxartes) on the N.E. side, and the Amu-Darya (or ancient Oxus) on the S.E. It has no outlet, and is generally shallow, its only deep water being on the west coast, where it reaches a depth of 225 feet; but it shoals gradually eastward to a mere marshy swamp. Its level is 117 feet above that of the Caspian, which is 84 feet below the surface of the Black Sea. Like other lakes which are drained only by evaporation, it is brackish. Fish, including sturgeon, carp, and

herring, are abundant. The lake is dotted with multitudes of islands and islets. Owing to the shallowness of its waters, and its frequent exposure to fierce and sudden storms from the N.E., navigation is difficult; and a flotilla of flat-bottomed gunboats, built for this sea by the Russians, and which took part in the operations against Khiva in 1873, alone patrols its surface. The history of the Sea of Aral is very remarkable. Sir Henry Rawlinson and Colonel Yule collected references made to it in Greek, Latin, Arabic, and Persian writers, and established the fact that the area it now occupies has been dry land twice within historical times—the Jaxartes and the Oxus then running south of the Sea of Aral to the Caspian. This was the case during the Greco-Roman period, and again during the 13th and 14th centuries after Christ. The Russian government, which pushed its frontier as far east as the Aral in 1848, has abandoned the idea of the diversion of the Oxus to the Caspian Sea, and has proposed to unite the two lakes by means of the steppe river Chogan, round the northern edge of the Ust-Urt plateau. See the article ASIA; *Proceedings of Royal Geographical Society*; and *The Shores of Lake Aral*, by Major Wood (1876). Also, for the formation of the lake, see Roesler's *Aralseefrage* (Vien. 1873).

Aralia, a genus of plants, the type of the Araliaceæ, which are a sub-order of Umbelliferae less developed in inflorescence, which is often racemose-umbellate, and in fruit, which has usually more than two carpels, and is often succulent—witness the berries of the common ivy. The order contains about 160 known species, natives of tropical, temperate, and cold climates, generally possessing stimulant and aromatic properties. Poisonous qualities are not developed as in the Umbelliferae. The herbage of many species affords good food for cattle, and some are used for human food. The genus *Aralia* contains a considerable number of species—trees, shrubs, and herbaceous plants. *A. nudicaulis* is sometimes substituted in the United States for sarsaparilla; and *A. racemosa*, *A. spinosa*, and *A. hispida*, all natives of North America, produce an aromatic gum resin. *A. spinosa* is a diaphoretic stimulant. The berries, infused in wine or spirits, are employed in America as a cure for rheumatism. It is sometimes called Toothache-tree: it also bears the name of Angelica-tree. It is a native of moist woods in Virginia and Carolina, growing to a height of 10 or 12 feet, with a single stem, spreading head, doubly and trebly pinnate leaves and ovate leaflets, and is very ornamental in a lawn. *A. polaris*, found in the southern island of New Zealand, described by Hooker as a very magnificent plant, is a herbaceous perennial, 4 to 5 feet high, with large orbicular masses of green foliage and waxy flowers, presenting a very striking appearance. *A. edulis*, now called *Dimorphanthus edulis*, is employed in China as a sudorific. Its shoots are very delicate and pleasant when boiled; and the roots, which have an agreeable aromatic flavour, are used by the Japanese as carrots or parsnips are in Europe. Aralias abound in the warm valleys of the Himalaya. The natives collect the leaves of many as fodder for cattle, for which purpose they are of great value in a country where grass for pasture is scarce; but the use of this food gives a peculiar taste to the butter. Chinese rice-paper is cut from cylinders of the pith of an aralia. Ginseng (q.v.), the root of a species of *Panax*, is one of the most important products of the order Araliaceæ. But it is upon their remarkable value as decorative plants that the interest and cultivation of the group increasingly depends. The only representative of this order in the British flora is the Ivy (q.v.).

Aram, EUGENE, was born in 1704 at Ramsgill, in Yorkshire. Though but the son of a poor gardener he contrived to acquire considerable learning, married early, and became a schoolmaster, first in Netherdale, and afterwards at Knaresborough, where he became intimate with one Daniel Clarke, a shoemaker. The sudden disappearance of the latter in 1745, at a time when he happened to be in temporary possession of a quantity of valuable goods, threw suspicion upon Aram, not as Clarke's murderer, but as his confederate in swindling the public. His garden was searched, and in it was found a portion of the missing property. Aram was arrested and tried, but acquitted for want of evidence. He now left his wife at Knaresborough, acted as a schoolmaster at various places in England, acquiring, in spite of his nomadic mode of life, a knowledge of botany, heraldry, Chaldee, Arabic, Welsh, and Irish. He had already amassed considerable materials for a Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic languages. His secret was betrayed by a confederate, who excited suspicion by the loudness of his protestations that a certain skeleton that had been found near Knaresborough was not that of Clarke. The accomplice was at last driven to confess where the murdered man had been buried; the bones were exhumed and identified, and Aram was suddenly dragged from his ushership at Lynn Academy in Norfolk, and thrown into prison on a charge of murder. He was tried at York, 3d August 1759, and sentenced to be hanged within three days. At the trial he conducted his own defence, attacking with great acumen, plausibility, and curious erudition, the doctrine of circumstantial evidence. After his condemnation, he confessed his guilt, wrote a defence of suicide, but failed in an attempt to illustrate his essay. A factitious interest has been attached to Aram's miserable story from Lord Lytton's overpraised romance, *Eugene Aram*, and Hood's powerful ballad, 'The Dream of Eugene Aram.'

Aramaic (from the Hebrew word *Aram*, signifying the 'highland,' in opposition to the lowland of Canaan) includes the whole of the country situated to the N.E. of Palestine. It embraced the countries known to the Greeks by the various names of Syria, Babylonia, and Mesopotamia. The *Aramaic language*, a branch of the Semitic, was common to the whole country, and was divided into two principal dialects—the West Aramaic or Syriac, and the East Aramaic, or, as it is improperly termed, the Chaldee. The former was that spoken almost universally in Palestine in the time of Christ. After the Babylonian captivity, the pure Hebrew, in which the whole of the Old Testament, with the exception of a few chapters in Daniel and Ezra, had been written, gradually gave place to the Aramaic. It was the common tongue of Palestine in the time of Jesus, and his quotations from the Old Testament are from an Aramaic version rather than from the original Hebrew; as, for instance, the beginning of the 22d Psalm, which he repeated on the Cross; while all the Semitic words that occur in the New Testament, as well as in Josephus, are also Aramaic, as *Mammon*, *Raka*, *Eli*, *Eli*, &c.; *Talitha kumi*, *Abba*, &c. The Talmud, especially the Babylonian, has a large admixture of Aramaic elements, while the Targums are entirely composed in this idiom. The Aramaic dialect is, in general, the harshest, poorest, and least elaborate of all the Semitic languages, and has now almost entirely died out and given place to the Arabic and Persian. In respect of development it stands midway between classical Hebrew and modern Arabic, having lost the severe simplicity of the one without gaining the flexible and cosmopolitan variety of the other. See SEMITIC LANGUAGES and TARGUM.

Aran, SOUTH ISLES OF, Ireland. These are three small islands lying NE. and SW. across the entrance to Galway Bay. Total area, 11,287 acres. The principal or west island, Inishmore or Aranmore, is 7 miles long and 2 broad; Inishmaan, or 'Middle Isle,' comes next; and then Inishere to the SE. The islands consist of carboniferous limestone, and rise to the height of from 200 to 354 feet on the west side, ending in cliffs facing the Atlantic. Most of the land is rudely cultivated. Inishmore is still known as *Aran-na-naomh*, or 'Aran of the Saints,' and many pilgrims still visit the old shrines and remains of churches scattered through the islands, as also the little beehive stone huts of the monks of the 6th and 7th centuries. There are several circular cyclopean fortresses of unhewn uncemented stones, of which the largest is Dun-Aengus, on a cliff in Inishmore. Pop. (1881) 3163, of whom two-thirds inhabit Inishmore.

Aranda, PEDRO DE BOLEA, COUNT OF, born in 1718 of a distinguished Aragonese family, at first embraced a military career, but was appointed ambassador to the court of Poland (1759), governor of Valencia (1763), and president of the Council of Castile (1766). Aranda not only soon restored order in the capital, but limited the power of the Inquisition, procured the expulsion of the Jesuits from Spain, and suppressed the banditti of the Sierra Morena. In 1773 he was removed from his high position through the influence of the clergy, and sent as ambassador to France. Recalled in 1792, he had soon to retire to his own estates, where he died in 1799.

Aranea and **Araneidae**. See SPIDER.

Aranjuez (probably the Latin *Ara Jovis*), a town of Spain, on the left bank of the Tagus, 30 miles SSE. of Madrid by rail, in a beautifully wooded valley. The town is regularly built, with broad streets intersecting each other at right angles. The palace was long a favourite spring-resort of the royal family, and was altered and added to by successive sovereigns from Charles V. downwards. The famous gardens were laid out by Philip II.; their most splendid ornament are the great elm-trees brought from England by Philip II., which radiate from a central plot in twelve avenues. At Aranjuez was concluded a treaty between France and Spain in 1772, and it was also the scene of the abdication of Charles IV. in 1808. When the court was here, the pop. used to reach 20,000; now it is only about 8150.

Arany, JÁNOS, next to Petöfi the most distinguished of modern Hungarian poets, was the son of a poor peasant, and was born at Nagy-Szalonta, 2d March 1817. In 1832 he entered the college at Debreczin, but in 1836 joined for a time a company of strolling-players. Settled at Szalonta, he worked as a teacher and as a notary. When the Kisfaludy Society offered a prize for the best humorous poem, his *Lost Constitution* obtained the prize. In 1847 he forwarded to the same society his *Toldi*, a national trilogy, which made the poet a popular favourite. In 1848 appeared his *Conquest of Murány*, which, however, was not so successful. He took a slight part in the revolution, but after the war was allowed to return to his country. He was afterwards professor of Hungarian literature, director of the Kisfaludy Society, editor of a journal, and secretary of the Hungarian Academy (1865-70). Later works are *Katalin*, a continuation of *Toldi*, two volumes of lyrics, *Buda Halála*, and a humorous poem recounting his early adventures (1874). Part of *Buda* has been translated into English. He died 22d October 1882.—His son LÁZSLÓ (born 24th March 1844) is also noted as a poet and translator of Shakespeare.

Arapaima, a genus of tropical fishes, including the largest known fresh-water forms. They are found in the rivers of South America, and are sometimes taken in the Rio Negro, 15 feet in length, and 4 cwt. in weight. They are shot with arrows or harpooned, and are highly esteemed as food; salted, they are conveyed in large quantities to Para. The genus *Arapaima* belongs to the family Osteoglossidae, allied to the Clupeidae or herring, and is remarkable for the mosaic work of strong bony scales with which the body is covered. The head is also protected by bony armature. *Osteoglossum* and *Heterotis* are closely related genera, found in various parts of the tropics.

Ararat (Armenian *Airarat*), a general old name for the district through which the Aras flows, and never the name by which the Mount of Ararat has been known to the people around it. Associated, however, as the mountains of this district are in Genesis, viii. 4, with the landing-place of the ark after the flood, the name has been, naturally enough, appropriated to the highest peak, which in Armenian is called Massis or Massis Ljarn; in Tartar and Turkish, Aghridagh, or curved mountain; and in Persian, Koh-i-Nuh, or Noah's mountain. The Chaldean legend, on the other hand, fixed the spot of Noah's landing in Gordyene, NE. of Nineveh and Mosul. The twin mountains of Ararat form an elliptical mass, 25 miles long from SE. to NW., by half that breadth, rising on the N. and E. out of the alluvial plain of the Aras, 2500 to 2800 feet high. The mass stands quite isolated on all sides but the NW., where a column 7000 feet high connects it with a long ridge of volcanic mountains extending westwards. From confluent bases of common level, 8800 feet high, the two peaks, both of entirely igneous formation, shoot upwards, Great Ararat to 16,969 feet, Little Ararat to 12,840 feet above the sea-level; the two summits 7 miles apart. From their isolation and bareness, the two peaks are very impressive—Little Ararat as an elegant cone of steep, smooth, regular sides; Great Ararat as a huge, broad-shouldered dome, supported by strong buttresses. The limit of perpetual snow rises in Ararat to nearly 14,000 feet. On the NE. side of Great Ararat is a remarkable chasm, 9000 feet deep, surrounded by monstrous precipices. There is a similar, but smaller, chasm on the SW. side. Ararat is singularly bare; the only wood of any extent, on the skirts of Little Ararat, at 7500 feet high, consisting of low birches. Ararat is perfectly dry throughout. Yet the mid-zone, from 5000 to 12,000 feet, is covered with good pasture, over which the Kurds wander in summer with their flocks. Below this mid-zone, Ararat has a steppe vegetation of dwarf prickly shrubs, and is unploughed and uninhabited. The top, at least during summer and autumn, is perfectly clear throughout the night, and till sometime after dawn. From 3 or 4 A.M., however, till sunset, clouds hang around Ararat for 3000 feet from the top. The view from the summit of Ararat, which towers over his neighbours much more than do Mont Blanc or Elburz, is singularly grand: there is the Caucasus, 280 miles away in the north; the dim plain of Erivan at the bottom; the extreme ranges of Taurus in the west; and a wilderness of bare red-brown mountains to the south and south-west. In 1828 the Czar Nicholas annexed the territory around Erivan; and Little Ararat is now the meeting points of the Russian, Turkish, and Persian empires. On the 20th of June 1840, dreadful shocks of earthquake were felt. Great masses of the mountain were thrown into the plain, a ravine was closed, a convent and chapel disappeared, and the village of Arguri, and the gardens which

surrounded it, were buried under rocks, earth, and ice. Tournefort made a partial ascent of the mountain in 1700; since then, ascents have been made in 1829 by Professor Parrot of Dorpat; in 1850 by Colonel Chodzko, and a large party of Russians engaged in the Transcaucasian triangulation; in 1856 by Major Robert Stuart; in 1870 by Dr G. Radde and Dr G. Sievers; and in 1876 by Professor Bryce. See the article 'Reisen im Armenischen Hochland' (*Petermann's Mittheilungen* for 1871); also *Transcaucasia and Ararat*, by Professor Bryce (2d ed. 1878).

Aras (the ancient *Araxes*), the chief river of Armenia, formed by the junction of the Bingol-Su and the Kaleh-Su, flowing E., SE., and NE., and uniting its waters with those of the Kur (ancient *Cyrus*) after a course of about 500 miles. It joins the Kur, which descends from the Caucasus through Georgia, about 75 miles from its mouth. Their united waters turn suddenly to the south, and fall by three mouths into the Gulf of Kizilgatch, in the Caspian Sea.

Aratus OF SICYON, a distinguished Greek statesman, was born about 271 B.C. He liberated Sicyon from its tyrant, Nicocles, in 251, and united it with the Achaian League, of which he was appointed general in 245. Under him the league grew in influence. His great object was to unite the Greek states, and form out of them an independent nation; but this was thwarted by their mutual jealousies and wars. The league ultimately fell under the power of Macedonia. Aratus was a brave general, a skilful tactician, and a disinterested patriot. According to Plutarch, he was poisoned in 213 by command of Philip III. of Macedonia.

Aratus OF SOLI (or Pompeiopolis, in Cilicia), a physician and poet of noble birth, a contemporary of Callimachus and Theocritus, lived mostly during the latter part of his life at the court of Antigonos Gonatas of Macedonia, at whose instance he wrote, about 270 B.C., his astronomical poem, *Phænomena*. This was founded on the astronomical system of Eudoxos of Cnidos, and consisted of 732 verses. He appended to it another poem, *Diosemeia*, giving rules for prognostication of the weather. A pure style and correct versification mark both poems, but they lack originality and elevation. They were translated into Latin by Cicero, Cæsar Germanicus, and Festus Avienus (q.v.). Aratus was a native of the same province as St Paul, who quotes from him in his speech on Mars' Hill: 'For as certain of your own poets have said, We also are his offspring.' The best editions are by Buttmann (1826), Bekker (1828), and Köchly (1851); and there is a translation of the *Phænomena* into English verse by Robert Brown (1885).

Araucania, the country of the Araucos or Araucanian Indians, in the south of Chili. The Chilian province of Arauco, lying between the Andes and the Pacific Ocean, and bounded on the north by Concepcion, on the south by Valdivia, was formed in 1875, with an area of 8100 sq. m., and a pop. (1885) of 93,565. A large part of the territory in Arauco and the more southerly province of Valdivia, is occupied by Indians, who have of late mostly submitted to Chilian authority. The Araucanians are interesting as furnishing the only example of Indian self-government in the presence of the European races. They are a fierce and warlike people, and have a kind of military aristocratic constitution. Formerly the government rested in the hands of four chiefs (*Toquis*), each nominated by one of the four divisions of the people, and one of whom was elected 'great Toqui.' They have no formal laws, but custom and tradition have all the force of these. They do not

now number more than 50,000. Their country is divided from north to south into four parallel regions, with varying soil and climate. These are the coast region, the plain region, the region of the Lower Andes, and the region of the Higher Andes. Araucania has the proud distinction of being the only portion of the New World that has never received the European yoke. From the days of Pizarro and Almagro downwards, it has uniformly vindicated its freedom—its wars of independence having lasted, with intervals of precarious truce, from 1537 to 1773. In 1861 a French adventurer, Tonneins by name, ingratiating himself with the Indians, was elected king of Araucania as Orélie Antoine I. He was soon at war with Chili, and was captured and allowed to go to France. Returning to Araucania, he kept up a struggle with the Chilians in 1869-70, but repaired once more to France in 1871, where he posed for a time as a dispossessed king, and died in 1878. See his *L'Araucanie* (Bord. 1878); Smith's *Araucanians* (New York, 1855); and Medina's *Los Aborígenes de Chile* (Santiago, 1882).

Araucaria, an evergreen genus of Coniferae, consisting of lofty trees, natives of South America and Australasia. *A. imbricata*, sometimes called the CHILI PINE, or more popularly, from the sharp-pointed leaves, the Monkey-puzzle, is a native of

Branch of *Araucaria imbricata*.

the Andes of Chili, forming forests on their western declivities, where it attains a height of 100 to 150 feet. The trunk is quite straight and free from knots, and yields abundant resin. Like many pines, the young trees have branches almost from the ground, but the older ones have tall naked stems with a crown of branches. The timber is heavy, solid, hard, fibrous, yellowish white, and beautifully veined. It is very suitable for masts of ships. The resin, which is white, has a smell like frankincense, and a not unpleasant taste. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food to the Indians. The generic name is derived from that of a tribe, the Araucanians, who especially use it as food, raw, boiled, or roasted. A spirituous liquor is also distilled from it. A single cone sometimes contains between two and three hundred seeds, and one tree may be seen loaded with twenty or thirty of these. This araucaria was introduced into Britain in the end of last century, and is now frequently planted, especially in small villa gardens, but for which its stiffly symmetrical and unvaried form is, however, peculiarly unsuitable. It is the only species which can at all withstand the climate of Britain. It requires a well-drained soil, and is apt to suffer in severe winters. *A. brasiliana*, the Brazil pine, has a

looser and more spreading habit than *A. imbricata*. The seeds are sold as an article of food in Rio Janeiro, and the resin which exudes from the tree is mixed with wax to make candles. *A. excelsa*, the Norfolk Island pine, attains a height of 160 to 220 feet, free from branches to 80 to 100 feet, and with a trunk sometimes 11 feet in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. *A. Cunninghamii*, the Moreton Bay Pine, a native of New South Wales, very much resembles the last. It attains a height of 60 to 130 feet, and a diameter of 4 to 8 feet. The wood is yellowish, and is used for boat-building, house-carpentry, and the common kinds of furniture. The large seeds of *A. Bidwillii* are used for food by the natives at Moreton Bay.

Certain fossil Coniferæ found in carboniferous sandstone have received the names *Arancarites*, *Araucarioxylon*, &c., and are closely allied to the existing forms, which, in fact, represent far more nearly than do any other trees the primitive forms of the palæozoic age. Livingstone found such fossils in abundance on the Zambesi, and great trees of this type are not uncommonly discovered in the carboniferous quarries around Edinburgh.

Araurê, a town of Venezuela, South America, 60 miles ENE. of Truxillo, in a region noted for its fertility in the production of cotton, coffee, cattle, &c. Pop. about 10,000.

Aravalli, a range of mountains in Western India, extending for 300 miles in a north-easterly direction through Rajputana. They consist of a series of ridges and peaks, many of them mere heaps of sand and stone, for the most part bare of cultivation. The highest summit is Abu (q.v.), 5650 feet.

Arbalest. See CROSSBOW.

Arbela, now Erbil or Arbil, a small town of Assyria, east from Mosul, famous as having given name to the battle in which Alexander finally defeated Darius, 331 B.C. The battle was really fought near Gaugamela (the 'camel's house'), to the NW. of Arbela.

Arbitration is the adjudication by private persons appointed to decide a matter or matters in controversy, on a reference made to them for that purpose, either by agreement of the disputants, or by the order, or on the suggestion, of a court of law. The proceeding generally is called a *submission to arbitration*, or *reference*; the parties appointed to decide are termed *arbitrators* or *referees*; and their adjudication is called an *award*. This mode of settling disputes is not only frequently resorted to by litigants themselves, who are anxious to avoid the delay and expense of proceedings in the public tribunals, but the Statute-book bears witness to the approval of it by the legislature at various times. An old act, the 9 and 10 Will. III. chap. 15, attests the benefits of arbitration in strong terms, and it proceeds to authorise and encourage merchants, traders, and others to put an end to their controversies and quarrels by means of arbitration; and an act of 1833 contains still more anxious provisions for rendering references to arbitration effectual. Since that act was passed, the practice and feeling in favour of arbitration has increased, so much so that there are recent statutes which contain provisions rendering arbitration, or private reference in certain cases, compulsory. The Railway Acts of 1845, the Public Health Act of 1848, Common Law Procedure Act of 1854, and Judicature Act, 1873, are modern examples of this legislation. Masters and workmen are specially empowered by an act of 1825, amended in 1872, to refer disputes to arbitration.

The matters that may be determined by an arbi-

trator are all personal disputes and differences which might otherwise be made the subject of controversy in the courts of civil jurisdiction. Thus breaches of contracts generally, breaches of promises of marriage, trespass, assaults, charges of slander, differences respecting partnership transactions or the purchase price of property, and questions relating to tolls or the right to tithes, may all be referred to arbitration. Questions relating to real property may also be referred, such as those relating to the partition of lands of joint tenants or tenants in common, to settlements of disputed boundaries—to differences between landlord and tenant respecting waste—and to the title to land. Pure questions of law may also be referred to the decision of an arbitrator. An arbitrator may have, therefore, to determine the liability of a party on a promissory-note or bill of exchange, or to construe an act of parliament, or to give a judicial opinion on the effect of a will or deed. Actions at law, and suits in equity, may also be settled by arbitration; and this kind of reference may be made at any stage of the proceedings, sometimes even after verdict, and probably by analogy, after decree in equity. Questions relating to the future use and enjoyment of property, and future or anticipated differences between parties, may likewise be referred. Trade disputes between employers and workmen are now frequently referred to arbitrators.

A matter clearly illegal, or contrary to public policy, cannot be made the subject of a valid reference. But where transactions between parties have been brought to a close by a general award, apparently good, the courts have refused to reopen them on a suggestion that some illegal item has been admitted in account. Among the questions that cannot be referred to arbitration are matters arising out of the administration of the criminal law in the case of felonies. Felonies and offences of a public nature cannot be referred, because the public safety and good require them to be punished, and for this purpose they can only be properly tried in one of the ordinary courts of the country.

There are certain matters which are specially referred to arbitration by statute. Besides those we have already alluded to, the following matters are all referable to arbitration: Questions relating to the expenses of prisoners, under the Prisons Acts, 1865 and 1877; to municipal corporations in England and Wales, under the Municipal Corporations Act, 1882; to savings-banks, under the 26 and 27 Vict. chap. 87; to episcopal and caputular estates, under the acts of 1832 and 1854; to the conveyance of mails by railways, under the 1 and 2 Vict. chap. 98; to insolvents and to insolvency, bankruptcy, and execution, under the Bankruptcy Act, 1883; to companies incorporated for carrying on public undertakings, and to the taking of lands for undertakings of a public nature, under the Consolidation Acts of 1845; to the metropolitan sewers, under the Metropolis Management Acts; and to friendly societies.

Under these acts of parliament, the class of cases which may, or which must, be referred to arbitration has been greatly enlarged. The Railway Acts, in particular, have largely contributed to this kind of amicable determination, although the parties in such cases cannot be said to have much discretion in the matter.

But there are certain misdemeanours which may be either settled by agreement or by means of an arbitration, on a principle of very general application stated by Chief-justice Gibbs—that where there is a remedy, by action as well as by indictment, a reference of the matter in controversy is good. And in these cases of misdemeanour, a compromise or settlement under a reference may be

made, even after conviction, but with the sanction of the court.

As to the parties who may make a reference to arbitration, it may be stated generally, that every one capable of making a disposition of his property or release of his rights may make a submission to an award, and in this category may be placed a married woman who has property for her separate use, and there are even cases where a reference between a husband and wife has been held valid; and of course a husband may submit to arbitration differences respecting his wife's personal estate which has not been settled to her separate use.

Respecting the powers of infants or persons under age to submit to arbitration, there are numerous decisions in the courts of law and equity: but they go upon refinements and nice distinctions more suited for the professional lawyer than for the ordinary reader, and we therefore do not think it necessary to give any explanation of them in a popular article such as this professes to be.

Partners and corporations may make references to arbitration on the principles already explained, and according to the relation in which they stand to the matter in dispute.

Those who cannot submit to arbitration are persons in the following position: Persons who cannot contract; married women without any estate settled to their separate use; and along with them, as laid down in old pre-Reformation books, persons professed in religion, and persons under duress. There is an exception to the incapacity of married women to refer to arbitration, where the husband, by exile, banishment, or other cause, is held to be civilly dead, and when he is an alien enemy. To these exceptions it may be added, that in suits respecting the property of charities the Court of Chancery will not permit a reference, however advisable such a course may seem, unless the attorney-general gives his consent.

It has generally been the opinion of the legal profession, and held to be the doctrine of the courts, that a reference by the consent of counsel in a cause is binding on his client; and Lord Chancellor Eldon once said that it was for the counsel to consider whether he was authorised to refer, and if so, he (the chancellor) would act on the consent so given; and the right and privilege of counsel to make a reference has been very strongly laid down in the Scotch courts. But a notable case in the Court of Common Pleas (*Swinfen v. Swinfen*), where a compromise by counsel was successfully resisted by the client, somewhat unsettled the English law on this subject; and now the feeling of the Bar in England is, that it is unwise to refer or compromise a litigation on the independent authority of counsel.

Submission to reference may also be made by executors and administrators, by trustees, by the committee of a lunatic, and by the officer of a public company, who is authorised by a statute to sue and be sued in the name of the company. And there are persons especially empowered to refer by the statutes which we have already enumerated.

Disputes may be referred to arbitration in any manner that expresses the agreement or understanding of the parties to be bound by the decision of the arbitrator; and for this purpose no formal submission, either verbal or written, is necessary; but the arrangement must be such as manifestly to show an intention to have the difference concluded by a private adjudication in the nature of an award. But where the submission is in writing, it must be executed in due form. A testator, however, cannot exclude his will from litigation by a proviso that all differences respecting it shall be referred to arbitration, although it is thought that the parties benefited by the will might themselves

so refer. Generally speaking, it is advantageous to make the arbitration in such a form as that the award may be made a rule of court—that is, may be adopted by a court of law as its judgment on the matter submitted, a proceeding that affords an obvious facility in enforcing the award; and for this purpose it is necessary to make the procedure conformable to the directions of the statutes 9 and 10 Will. III., and 3 and 4 Will. IV., already referred to. Where the submission is merely verbal or constituted by a private bond or deed, it is liable to be capriciously revoked, and the party injured by the revocation has only an equitable claim to compensation.

The arbitrator ought to be a person who stands perfectly indifferent between the disputants; but there are no other particular qualifications for the office. And the choice by parties of the person whom they agree shall decide between them is perfectly free. Some legal writers have even gone so far as to maintain, that not only infants and married women, but even idiots and lunatics, can be arbitrators, on the argument that every person is at liberty to choose whom he likes best for his private judge, and he cannot afterwards object to the deficiencies of those whom he has himself selected. But this, it is clear, is going too far, and the policy of the law would certainly be interposed against such extreme cases. It is better to state the rule to be, that on the condition that the party selected is of ordinary intelligence, the choice of an arbitrator is absolutely unfettered. The only exception to this rule is the case of a party who, by office or position, is the person pointed out for the duty under a reference made by statute. In matters of complicated accounts, mercantile men are generally preferred. In other cases, it is usual to appoint barristers who, being accustomed to judicial investigations, are able to estimate the evidence properly, to confine the examination strictly to the points in question, and, in making the award, to avoid those informalities in respect of which it might afterwards be set aside. Both time and expense are thus saved by fixing on a professional arbitrator. It has, indeed, been wisely remarked, that an arbitrator should endeavour to arrive at his conclusions upon the same rules and principles which would have actuated the court for which he is substituted—a rule of conduct that obviously points to the expediency of a lawyer being the referee. But an arbitrator is not bound by the mere rules of practice which prevail in the ordinary courts of justice, and he has been held justified in allowing interest on both sides of an unliquidated account, although such a determination was against the practice of the Court of Chancery, where the suit, which had been referred, had been commenced.

The proceedings before an arbitrator are regulated according to the peculiar circumstances of the case submitted, but generally it is advisable to conduct them according to the forms observed in courts of law, and they usually are so conducted. Each of the parties furnishes the arbitrator with a statement of his case, and on the day appointed he proceeds to hear them (either in person or by their counsel or attorneys), and to receive the evidence on each side, nearly in the same manner as a judge at an ordinary trial. Having so heard the case, the arbitrator proceeds to make his award, which need not necessarily be in writing, for a verbal award is perfectly valid; but in practice it is usual for the arbitrator to make his award on paper stamped with the proper award stamp, and this he delivers to the successful party. The unsuccessful party gets a copy of the award on unstamped paper. This award in its effect operates as a final and conclusive judgment respecting all the matter

submitted, and it binds the rights of the parties for all time.

An award may be set aside on the ground of corruption and fraud in the arbitrator, and for any material irregularity or illegality appearing on the face of the proceedings. But the tendency of the courts is to favour arbitrations and maintain awards, unless such serious grounds as we have referred to can be substantiated.

Where there are two arbitrators, the submission often provides that in the case of their differing in opinion the matter referred shall be decided by a third person, called an umpire, who is generally appointed under a power to that effect, by the arbitrators themselves. But they cannot make such an appointment unless specially authorised so to do by the terms of the submission. This umpire rehears the case, and for this purpose is invested with the same powers as those possessed by the arbitrators, and bound by the same rules.

In Scotland, an arbitration takes place in virtue of a written submission executed by the parties in favour of the chosen referee, who there is called an arbiter, instead of arbitrator as in England; and his award is called a decree-arbitral. This submission is in the form of a regular deed, and is said to be general or special, according to the nature of the matters submitted by it, the submission specifying all the particulars of the reference, and the name of the referee—the arbiter's powers and duties, which, in the ordinary case, are of the most comprehensive character—the specification of the time within which the award or decree-arbitral is to be made—a clause obliging the parties to perform the award under a specified penalty; and other provisions, which are all carefully specified in the submission. The case then proceeds before the arbiter, generally according to the forms observed in the ordinary Scotch courts; and the arbiter makes his award in a very solemn manner, the decree-arbitral commencing with a recital of the submission and of all the procedure—and after stating that the arbiter has ripely considered the whole matter, and has 'God and a good conscience before his eyes,' it gives the arbiter's judgment, and among other things ordains the submission and decree to be recorded according to the clause of registration in the former, and the extract from the registry so made forms a judgment which may be put in execution by either party against the other. The decree-arbitral, like the submission itself, must be executed and attested in the form of a regular deed. Where there are two arbiters, the submission usually provides, that in the event of their differing in opinion, they shall name an umpire or oversman, as he is called in Scotland, whose judgment is final.

In the United States, arbitration is carried out on substantially the same principles as in England. But the several states differ from one another in details. There are state boards of arbitration in some states. From the nature of the case, there can be no appeal to any public tribunal whatever on the merits of a dispute submitted to arbitration. International arbitration has been of late repeatedly had recourse to in matters of debate between nations. Thus, as between Britain and the United States, the San Juan boundary question, and the Alabama (q.v.) dispute were so arranged. The dispute between Spain and Germany as to the possession of the Caroline Islands was settled in 1885 by the arbitration of the pope. Diplomatic conferences, which often obviate war, belong to a different category. See INTERNATIONAL LAW.

Arbo'ga, an ancient town in Sweden, in the province of Westmanland, on a small river of the same name, by which, with the aid of a canal, the

lakes Hielmar and Mälar are united, 101 miles WNW. of Stockholm by rail. Once an important commercial town, it has now sunk into insignificance. Its town church contains an altar-piece of Rembrandt's. Pop. (1881) 3823.

Arbois, a town in the French department of Jura, 7 miles NE. of Poligny by rail. It was the birthplace of Pichegru. Pop. (1881) 4639.

Arbor Day, in America, a day set apart for the planting of shade trees, shrubs, &c. by school children. Trees for transplanting are given by farmers and other friends of the children; or excursions are made to the nearest wood, and saplings of forest trees brought back. Millions of trees have been planted, and the institution is expected to add to both the beauty and salubrity of the towns especially. The first Friday in May has been selected for this purpose in Canada; in the United States, different days are chosen in the several states.

Arbores'cent (Lat. *arbor*, 'a tree'), a term applied to plants to signify that they possess either altogether, or in some measure, the character of trees. Even the dwarf willows and birches, on the confines of polar or alpine perpetual snow, are described as the arborescent vegetation of these regions.

Arboricul'ture, a term literally signifying the cultivation of trees, is in use generally restricted to the planting and management of timber trees, exclusive of the cultivation of fruit trees, which is a branch of horticulture or gardening.

The ancients practised arboriculture to some extent, but chiefly with the view of beautifying their villas, or of forming public walks in the vicinity of cities. The planting of timber trees for economical purposes, or with a view to profit, is unnecessary whilst natural forests are abundant, and can scarcely be referred, even in Britain, to an earlier period than the beginning of the 16th century, nor did it become general till a much later date. The early forest laws of England, as of other feudal countries, had reference chiefly to game, for the sake of which large tracts were depopulated and converted into *forests* by the first Norman kings. Plantations for timber and fuel were, however, made in England in the 16th century; and the importance of the subject was urged on public attention by authors of that period. In the 17th century, the greatly increased demand for oak, for the building both of ships and of houses, gave a new impulse to arboriculture, which attracted the attention at once of the government and of the great landowners: the publication of Evelyn's *Sylva* also rendered an important service in promoting a taste for it; and the next great work was Loudon's. Nurseries for forest trees were first established in this century. It was not until the beginning of the 18th century that the first extensive plantations were made in Scotland, nor until towards the end of that century that arboriculture became general in that country or in Ireland. How much the landscape has been changed by the introduction of foreign trees, it is not easy to imagine; and how much these changes have promoted and are indicative of improvements in agriculture and increased productiveness of land, is difficult to estimate.

In Britain, arboriculture, or the planting and tending of single trees, has been better understood than *sylviculture*, or the reproduction by seed and training of natural forests. In France and Germany, attention has long been paid to sylviculture by conserving the indigenous woods. Without systematic management of these tracts, many districts of these countries would soon be destitute of fuel, and by means of it an increased supply of

timber is obtained, and extensive domains belonging to the state or to private proprietors are rendered more productive.

The forest trees of Britain, and of temperate climates generally, are conveniently divided into two classes—the one consisting of coniferous trees, or pines and firs (*Nadelholz*—i.e. the 'needlewood' of the Germans), the other including all other kinds (*Laubholz*—i.e. the 'leaf-wood' of the Germans); the latter being sometimes subdivided into *hard-wooded trees*, of which the most important in Britain are oak, ash, elm, beech, birch, hornbeam, sycamore, walnut, and chestnut; and *soft-wooded trees*, as willow, poplar, lime, and horse-chestnut. Of these and other trees, of their particular uses, and of the soils and situations to which they are adapted, notice is taken in separate articles.

Plantations are generally formed in Britain by means of seedlings raised in a nursery; but sometimes also by sowing the seed on the ground intended for the plantation; in which case, a crop of grain is often sown along with the seeds of the trees, as these do not in general vegetate very soon; and the young plants derive advantage from the absence of weeds when the grain-crop is reaped, and from the protection afforded by the stubble. However, only very small trees can be planted with advantage, those which have attained a greater size requiring more attention than is possible in plantations even of moderate extent. The time of planting is in spring or autumn. The most approved mode of planting is in small pits, in which the roots are disposed in a natural manner, and which are then carefully filled up with earth; but it is often sufficient, when the seedling to be planted is very young, to make a slit for it with the spade, or two slits, one at right angles to the other in the form of the letter T. Other methods are adopted, particularly for rocky situations, in which the spade cannot be used. Economy is a consideration of great importance in determining the mode of planting.

The formation of plantations by the sowing of seed is more generally practised on the Continent than in Britain. In this way the vacancies in the natural forests of France and Germany are filled up, and great sandy tracts have been covered with wood on the coasts of Denmark, Prussia, and France. This has been accomplished on a scale of extraordinary magnitude in the dunes of drifting sand, between the rivers Adour and Gironde. The operations begun by M. Bremon tier in 1789 deserve to be mentioned, as perhaps the most important operations in arboriculture that have been performed in the world. Vast forests of pinaster now occupy what was originally loose sand destitute of vegetation. In recent times, the planting of teak, cinchona, sandalwood, eucalyptus, and deodar, by the Forest Department in India, is a work of great utility, and has already been a financial success.

Too little attention has been paid to the adaptation of the kinds of trees that are planted to the soil and climate; and to this cause many failures in arboriculture may be ascribed. Some trees grow well even in exposed situations, and are fit to be employed either to form entire plantations, or to occupy the outer part, and so to shelter other trees, which in general are not planted until the outer zone or belt of the most hardy kinds is somewhat advanced; some succeed only in rich soils; some are incapable of enduring the sea-breeze; others, as the sycamore, the elder, and the pinaster, are comparatively unaffected by it. Some trees suffer from an amount of moisture from which alders or willows would rather derive advantage; but, in general, the thorough drainage of the land intended for a plantation is important to its success.

We must look to the necessity of drainage, especially of marshy soils, as compensating the influence which woods exercise in condensing the moisture of the atmosphere, and in rendering a climate cold and damp. The shelter afforded by plantations judiciously disposed, whether in belts or otherwise, is also of great importance in rendering soils suitable for that improved agriculture in which thorough drainage is of the first necessity, and which is always productive of amelioration of climate. The influence of plantations is therefore beneficial, although vast masses of forest are injurious to climate; and it must be admitted that in some localities the planting of trees has been carried to excess, so that fields often suffer, particularly in autumn, from want of free circulation of air.

Much has been written about the pruning of forest trees, with a view especially to the production of taller and straighter stems; and considerable difference of opinion exists as to the extent to which pruning should be practised. It is, however, generally delayed till the branches to be removed have attained too great a size, and is then rudely performed, to the spoiling of the timber rather than to the improvement of it. The practice of leaving *snags*, instead of cutting branches clean off, has injurious effects. Pines and firs, from their manner of growth, need pruning less than trees of other kinds. When trees have been planted, not for profit but for ornament, this ought to be remembered in pruning, which, however, is often intrusted to persons utterly devoid of taste; and trees which were very beautiful in nature, are so treated with axe and saw that they become unsightly deformities.

In forming plantations, different kinds of trees are generally mixed, although masses of one particular kind are also frequently planted. It is usual, however, to plant along with those which are destined permanently to occupy the ground, trees of other kinds as *nurses*, to be gradually removed as the plantation advances in growth. For this purpose, spruce and larch are generally employed; although Scotch fir and birch are also deemed suitable for certain situations. The removal of some of these nurses affords the first return of profit from the plantation, which is afterwards thinned from time to time. Plantations more frequently suffer from being thinned too little, than from being thinned too much. To the want of proper thinning is to be ascribed the failure of many of those narrow belts of *planting* which are too common in Scotland, and which, having been intended for shelter, serve their purpose but imperfectly, and seem to have suffered from maltreatment. The thinning of a plantation which has been allowed to grow too thick, must, however, be gradually performed, that it may be beneficial and not injurious. After a sudden thinning, a plantation sometimes ceases to thrive, and many trees are laid prostrate by the next storm; for trees accommodate themselves both in their roots and branches to the situations in which they grow.

A considerable number of years must elapse before any pecuniary return is derived from a plantation, yet the planting of unculturable land is often found to be the most remunerative of which they are capable, even without reference to the improvement of adjacent lands to which shelter is afforded. The resinous products of pine-woods are not considered as a source of profit in Britain; but the tar, turpentine, and resin obtained from them in some parts of Europe form articles of commerce.

The wholesale destruction of forests in the United States brought about serious evils; and of late, measures have been taken, both by public autho-

rities and private persons, for cherishing existing trees and woods, and for planting extensively where the ground is bare of timber. In some of the western states especially, where the need of shelter for horses, crops, and cattle has been found in increasing measure, the movement is now carried on on a very large scale, trees being planted by millions annually.

The employment of trees for ornamental purposes belongs not so much to arboriculture as to Landscape Gardening (q.v.). The Transplanting (q.v.) of large trees is only practised for ornamental purposes. Hedgerow trees are planted chiefly for ornament, although sometimes they afford useful shelter; but where this is not the case, they can seldom be reckoned profitable, as they are injurious to crops. Copse (q.v.) or coppice-wood differs much, both in its uses and in the mode of its management, from other plantations.

There is a great school of forestry at Nancy, to which English students used largely to resort; and Germany and most European countries have special forestry schools. The Forestry Exhibition at Edinburgh in 1884 created some popular interest on the subject. In 1887, a committee appointed by the House of Commons recommended the establishment of a Forestry Board and national school in England.

Certificates in forestry are granted by the Highland and Agricultural Society of Scotland, whose *Transactions* contain valuable papers on arboriculture; and at the Indian Engineering College, Cooper's Hill, Staines, a course of two years' training is arranged for forest candidates preparing for the Indian Forest Department. See Brown's *Forester*, Grigor's *Arboriculture* (2d ed. 1881); and for sylviculture, the *Elements of Sylviculture*, by Bagnieris (Eng. trans. 1882).

Arbor Vitæ (*Thuja*), an evergreen genus of coniferous trees and shrubs allied to the cypress. The common Arbor Vitæ (*T. occidentalis*) is a native of North America, especially between lat. 45° and 49°, but has long been well known in Europe. It is a tree of 20 to 50 feet high; the young leafy twigs have a balsamic smell, and both they and the wood were formerly in great repute as a medicine; the oil obtained by distillation from the twigs, which has a pungent and camphor-like taste, has been employed as a vermifuge. The wood of the stem is reddish, soft, and very light, but compact, tough, and durable, bearing exposure to the weather remarkably well. The tree is often planted in Britain as an ornamental tree, but does not attain so great a size as in its native country. It delights in cool, moist situations.—The Chinese Arbor Vitæ (*T. Biotæ orientalis*), a native of China and Japan, which is immediately distinguishable from the former species by its upright branches and larger, almost globose and rough cones, is also a common ornament of pleasure-grounds in Britain and on the Continent; but it does not grow so tall as the preceding, and is more sensible of the cold of severe winters. The balsamic smell is very agreeable. The tree yields a resin having a pleasant odour, to which high medicinal virtues were formerly ascribed; hence the remarkable name, *Arbor Vitæ* ('tree of life'), given to this species, and extended to the genus. In its native country, this species also attains the size of a considerable tree.—There are several other species of *Thuja*, some of which seem well suited to the open air in the climate of Britain, and others require the protection of greenhouses. See CONIFERÆ; ARAUCARIA, CEDAR, CYPRESS, SANDARACH.—When the human cerebellum is cut vertically, a tree-like appearance seen is called *arbor vitæ*.

Arbroath', ABERBROTH'WICK, or ABERBROTH'OCK, a seaport and manufacturing town of Forfar-

shire, at the mouth of the Brothock Burn, 17 miles ENE. of Dundee. Here in 1178 William the Lion founded a Tyronensian abbey in honour of Becket; and here in 1214 he was buried. Cardinal Beaton was the last of its thirty-two mitred abbots. Next to Holyrood, the abbey was the most richly endowed monastery in Scotland. It was destroyed by the Reformers in 1560. The ruins of its cruciform church, which measured 276 by 160 feet, and was mainly Early English in style, are very picturesque, presenting a noble west doorway and a rose-window, 'the round O of Arbroath.' Dr Johnson greatly admired them in 1773. The chief industries of Arbroath are flax-spinning, jute-spinning, the manufacture of sail-cloth and linen fabrics, in which about one-fifth of the population is employed. The new harbour, begun in 1841, admits vessels of 400 tons; the old harbour was converted into a wet-dock (1871-77). The tonnage of vessels entering the port annually ranges between 35,000 and 45,000. The chief exports are grain, potatoes, fish, pork, and paving-slabs; the chief imports are coal, flax, hemp, jute, and hides. Arbroath is a royal burgh, and in conjunction with Montrose, Brechin, Forfar, and Bervie burghs, returns one member to parliament. Arbroath is the 'Fairport' of *The Antiquary*; Auchmithie, 3½ miles to the NE., is its 'Musselcrag'; and the Redhead Crags and Coves form some of the scenes in that novel. The famous Bell-rock (q.v.) is 12 miles SE. Pop. (1831) 13,795; (1861) 17,593; (1881) 21,758. See Miller's *Arbroath and its Abbey* (1860); and Hay's *History of Arbroath* (1876).

Arbroath Flags, the name given to a series of thin-bedded gray sandstones and flagstones which occur in the Lower Old Red Sandstone of Forfarshire. The remains of a number of ganoid fishes have been obtained from the Arbroath flags. The strata have been extensively quarried in Forfarshire for flagstones, which, however, are of a somewhat softer quality than the flagstones obtained from Caithness. They are most commonly employed for inside pavements, &c.

Arbuthnot, or ARBUTHNOTT, JOHN, physician and wit, the friend of Swift and Pope, was born at Arbuthnot, in Kincardineshire, in 1667. He studied medicine at Aberdeen, but took his M.D. degree at St Andrews (1696). He removed soon after to London, and there supported himself by teaching mathematics. In 1697 he published an *Examination of Dr Woodward's Account of the Deluge*, which brought him into notice as a man of no common ability. Accident called him into attendance on Prince George of Denmark; in 1705 he was appointed physician-extraordinary to the queen, and her death in 1714 was a severe blow to his prosperity. In 1715, along with Pope, he assisted Gay in *Three Hours after Marriage*, a farce that, in spite of the trio of wits, proved a complete failure. He pronounced the Harveian oration in 1727, and died 27th February 1735. Arbuthnot was one of the leaders in that circle of wits which adorned the reign of Queen Anne, and was still more nobly distinguished by the rectitude of his morals and the goodness of his heart. He was one of the kindest and truest of friends—'If there were a dozen Arbuthnot's in the world,' wrote Swift to Pope in 1725, 'I would burn my Travels.' Utterly careless of literary fame, he was the chief, if not sole author of that brilliant satire, the *Memoirs of Martinus Scriblerus*, first published in Pope's works (1741); and his too was the celebrated political *jeu d'esprit*, the *History of John Bull* (1712), which has so often been imitated. Among his scientific works, the essays *On Aliments* (1731) and *Concerning the Effects of Air on Human Bodies* (1732) possess

much merit. The latter particularly displays a deep knowledge of physiological laws. See a long article in the *Asclepiad* (1887).

Arbutus, a genus of small trees and shrubs belonging to the order Ericaceæ. *Arbutus unedo*, the Strawberry Tree, is a native of the south of Europe, found also in Asia and America, and in one

Arbutus unedo :
a, fruit; b, section of fruit.

locality in the British Isles, the Lakes of Killarney, where its fine foliage adds much to the charm of the scenery. In Britain, it is often planted as an ornamental evergreen. It grows to the height of 20 to 30 feet, but is rather a great bush than a tree. The bark is rugged; the leaves oblong-lanceolate, smooth, shining, serrate; the flowers nodding; corolla urn-shaped, greenish white; the fruit scarlet, somewhat resembling a strawberry, with a vapid sweetish taste. A wine is made from it in Southern Europe, which, however, is narcotic, as the fruit itself is when eaten freely. The bark and leaves are astringent. *Arbutus Andrachne* is also sometimes cultivated as an ornamental plant in Britain, but is impatient of severe frosts. Its fruit, and that of *Arbutus integrifolia*, are eaten in Greece and the East. But all the species seem to possess narcotic qualities, the fruit of *Arbutus furens*, a small shrub, a native of Chili, so much so as to cause delirium.—*Arbutus aculeata* (Cape Horn) is an elegant evergreen, resembling the myrtle; and the *Arbutus Menziesii*, or madroña tree of Western North America, is a very interesting and beautiful species.

Arc. See JOAN OF ARC.

Arc (Lat. *arcus*, 'a bow') is any part of a curved line. The straight line joining the ends of an arc is its *chord*, which is always less than the arc itself. Arcs of circles are *similar* when they subtend equal angles at the centres of their respective circles; and if similar arcs belong to equal circles, the arcs themselves are *equal*. The length of an arc is readily found if the angle which it subtends at the centre of the circle is known, and also the length of the whole circumference. Let the whole circumference be 100, and the angle of an arc 50°, the length of the arc is $360 : 50 :: 100 : \frac{100 \times 50}{360} = 14$ nearly.

Arca, or ARK-SHELL, a genus of lamellibranchiate molluscs. See LAMELLIBRANCHIATA.

Arcachon, a bathing-place which has grown up since 1854, on the south side of the Bassin d'Arcachon, 34 miles SW. of Bordeaux by rail.

The fine broad sands are admirably adapted for bathing; and the place is sheltered by sand-hills, covered with extensive pine-woods, in which game abounds. Its main street stretches 2½ miles along the shore, with the pine-forest immediately behind. The climate is always temperate, and the rainfall is but 32 inches. Its numerous villas amongst the firs are much frequented in winter by invalids afflicted with lung disease. Scientific oyster-culture is practised here on a large scale. There are 3300 oyster 'parks' in the lagoon, lined with 6000 ova tiles for the collection of oyster spat, and calculated to yield two hundred millions of infant oysters in a single season (see OYSTER). Pop. (1876) 4934; (1881) 7087.

Arcade (Fr.), a row of arches supported by columns, either having an open space of greater or less width behind them, or in contact with masonry. The arcade in Gothic corresponds to the colonnade in classical architecture. The term arcade is sometimes applied to the row of piers, or columns and arches, by which the aisles are divided from the nave of a church, or by which cloisters, or what are erroneously called piazzas in Britain, are inclosed; but it is more generally confined to those series of smaller arches which are employed simply for purposes of ornamentation. Arcades of the latter kind are often found surrounding the square towers of English churches. The term is also applied, but improperly, to a glass-covered street or lane, with a row of shops or stalls on each side.

Arcadia, the central and highest part of the Peloponnesus, was in length about 50 miles, in breadth about 40. According to Pausanias, it derived its name from the eponymous hero Arcas, the son of Callisto. Next to Laconia, Arcadia was the largest country in the Peloponnesus. It was girt round by a ring of mountains, which cut off to a large extent its communication with the rest of the peninsula. Mountains also intersected it in different directions. The western part of what was anciently Arcadia is wild, bleak, and rugged; the eastern is more fertile. The loftiest peak in Arcadia—the loftiest also in the Peloponnesus—is Mount Cyllene, in the north-east (7787 feet). The chief river is the Alpheus (q.v.). The modern province of Arcadia has an area of 2020 sq. m., and a pop. (1879) of 148,905. Originally Arcadia was named Pelasgia, after its first inhabitants, the Pelasgi. Subsequently, it was divided into several small states, which formed a confederation. Of these, the chief were Mantinea, Tegea, Orchomenos, Pheneus, and Psophia. The inhabitants, engaged chiefly in tending cattle and in hunting among the wild highlands, remained long in a state of barbarism. They were passionately fond of music and dancing, and were especially devoted to the worship of Pan and Artemis. Arcadia became both to ancient and modern poets the land of peace, innocence, and patriarchal manners; but the Arcadian shepherds of modern pastoral poetry harmonise but indifferently with the barbarous hill-men of ancient Arcadia.

Arcadius, first emperor of the East alone, was born in Spain, 377 A.D., and was the son of the Emperor Theodosius, after whose death in 395 A.D. the Roman empire was divided into East and West, the West falling to Honorius. Arcadius lived in oriental state and splendour, and his dominion extended from the Adriatic Sea to the river Tigris, and from Scythia to Ethiopia; but the real rulers over this vast empire were, first, the Gaul Rufinus, and afterwards the eunuch Eutropius, who openly assumed the reins of government and the command of the army, while the emperor reposed in luxurious indifference. In 399 Eutropius was for a time supplanted by another usurper, Gainas; and afterwards,

Eudoxia, the wife of the emperor, assumed the supremacy. The great archbishop, Chrysostom, was exiled by Eudoxia in 404, because of his stern denunciation of vice. During the reign of Arcadius, his territories suffered by barbarian incursions, earthquakes, and famine. He died in 408 A.D.

Arcani Disciplina. See DISCIPLINA ARCANI.

Arcanum, THE GREAT. In the middle ages, the Latin word *arcanum* ('secret') was used of any of the most valued preparations of alchemy; but the title was especially applied, as above, to the highest problems of the science, the discovery of such supposed great secrets of nature as the grand elixir. See ALCHEMY.

Arcesila'us, a Greek philosopher, founder of the New Academy, was born at Pitane in Æolia, Asia Minor, 316 B.C. He studied philosophy, first under Theophrastus the Peripatetic, and afterwards under Crantor. He ultimately became the head of the Academic school, or those who held the doctrines of Plato; but he introduced so many innovations that its philosophic character was completely changed in the direction of scepticism. His great rivals were the Stoics. He denied the Stoical doctrine of knowledge, which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the existence of any sufficient criterion of truth, such as the 'irresistible conviction' of the Stoics, and recommended abstinence from all dogmatic judgments. In practice he maintained that we must act on grounds of probability. It is not easy to determine satisfactorily what his theory of morals was. A wit, a poet, and a man of frank and generous disposition, which seems to have captivated his disciples even more than his philosophy, he was yet accused of the grossest profligacy. He died in his 76th year (241 B.C.).

Arch, JOSEPH, was born at Barford, Warwickshire, in 1826, and whilst still a farm-labourer, became a Primitive Methodist preacher. In 1872 he founded the National Agricultural Labourers' Union, and thereby, according to Mr Justin M'Carthy, 'began the emancipation of the rural labourers.' He afterwards visited Canada to inquire into the labour and emigration questions; and for half a year (1885-6) he represented the north-west division of Norfolk. See Heath's *English Peasantry* (1874).

Arch, a concave structure of bricks, stones, or other materials built or turned on a centring over an open space, and so arranged as to support each other by mutual pressure, and to sustain a superincumbent weight. Wilkinson says that the arch was known to and used by the ancient Egyptians; and the Assyrians were acquainted with its principles. The arch was not unknown to the Greeks, though they did not employ it generally in their architectural structures. It is to the Romans that the nations of modern Europe are indebted for the use of the arch. The Romans most probably derived their acquaintance with it from the Etruscans, who, as well as the Pelasgians (q.v.) of Greece, made their arches pointed. The introduction of the arch by the Romans gradually effected a complete revolution in the architectural forms which they had borrowed from the Greeks. The predominance of horizontal lines gave way by degrees, till, in the works of the late empire, such as the palace of Diocletian at Spalatro, the entablature was entirely omitted, and the archivolt sprang from the capital of the columns. The Greek traditions of architrave, frieze, and cornice were thus at last got rid of, and in the Romanesque and Gothic styles the arches sprang freely from the caps of the shafts. A very simple structure, frequently met with in the so-called Saxon early edifices in our own country,

consists of two stones, their lower ends resting on rude piers, their tops leaning against each other, and thus forming two sides of a triangle, which is capable of supporting a moderate superincumbent weight. It is not impossible that out of this rude construction the arch, in its later and more elaborate forms, may have developed itself.

Of the arch itself, the following variations of form may be enumerated: the semicircle (1), the segment (2), the ellipse (3), which were the only forms employed by the Romans, and which alone were known in medieval architecture up to the time at which the pointed arch was introduced. The stilted arch (4) and the horseshoe arch (5) are modifications of these, and in both the centre or point

1. Semicircle.

2. Segment.

3. Ellipse.

4. Stilted Arch.

5. Horseshoe Arch.

from which the arch is described is above the line of the impost; but in the former the mouldings are continued downwards vertically, whilst in the latter they are slightly inclined inwards, or the curve is prolonged till it meets the impost. The horseshoe arch belongs peculiarly to Arabian Architecture (q.v.), not only from its having been adopted along with the faith of the Prophet, but from its continuing to be used exclusively by his followers. The pointed arch, as we have seen, was employed by the Pelasgians, and examples are also found in Egypt and Persia of very early date. It was probably introduced into Western Europe by the Mohammedans, and was universally employed in the vaults of the churches of Provence from the 10th to the 12th century. This arose from its being simpler of construction than the round vault. In the 12th century this form was adopted in Northern France, and was soon developed into the Gothic style (q.v.). The greater or less acuteness of the pointed arch depends on the position of the two centre points from which its curved sides are described. Its various proportions will be better understood from the accompanying diagrams (6, 7, 8, 9) than from any verbal description.

6. Equilateral Arch.

7. Lancet Arch.

8. Drop Arch.

9. Segmental Arch.

Of the foil arches (10, 11, 12, 13, 14), or arches in which the forms of a leaf are imitated, the first three are examples of the trefoil, the fourth of the

cinquefoil, and the fifth of the polyfoil, the last being met with in Arabian and Romanesque buildings. At a later period of Gothic architecture,

10, 11, 12. Trefoil Arches.

with the decorated style, the ogee arch (15) was introduced, and the Tudor or four-centred arch

13. Cinquefoil Arch.

14. Polyfoil Arch.

(16) appeared about the commencement of the Perpendicular style. When first introduced, the

15. Ogee Arch.

16. Tudor Arch.

proportions of this arch were bold and effective; but it was gradually depressed till the principle of the arch was lost, and its very form was again merged first in three, and then in one flat stone or lintel over an opening. With the last form of the Tudor arch we thus reach almost the point of departure in the construction of the arch, and complete our enumeration of its forms.

The sides of an arch are termed *haunches* or *flanks*, and its highest part is called the *crown*.

The wedge-shaped stones, bricks, or other materials of which an arch is constructed, are called *voussoirs* (*a, a, a*); the uppermost one of all (*b*) is called the *keystone*; the lowest, which is placed immediately over the impost, the *springer*, (*c*), or springing-stone; the under or lower side of the voussoirs, the *intrados*; the upper side, the *extrados* or *back*. For the mechanical principle of the arch, and of the con-

ditions of stability, reference must be made to works on mechanical engineering. See also BRIDGE, BUTTRESS.

Arch, TRIUMPHAL, a structure erected by the Romans across roads, or at the entrance of cities, in honour of victorious generals. The earliest triumphal arches were two erected by L. Stertinus (196 B.C.) in the Circus Maximus and the Forum Boarium. Under the emperors, these structures became numerous and magnificent, and were decorated with bas-reliefs and inscriptions. Of nearly forty that were built during that period, at least three remain, those of Titus (*circa* 82 A.D.), Septimius Severus (203 A.D.), and of Constantine (306-337 A.D.). Numerous similar monuments

exist also in other parts of the old Roman empire, as at Rimini, Susa, Verona, Ancona, Orange (in France), Capura (in Spain). Napoleon proposed to adorn Paris with four triumphal arches, and erected in 1806 the Arc de Triomphe du Carrousel, between the Louvre and the Tuileries, after the model of the arch of Septimius Severus. The Arc de Triomphe de l'Étoile, beyond the Champs Elysées, was begun at the same time, but not completed till 1836. Through it the Germans marched on their entry into Paris in 1871. In London there is the Marble Arch, transferred to Hyde Park in 1851 from Buckingham Palace, where

Arch of Titus.

George IV. erected it at a cost of £80,000. It resembles the Arch of Constantine.

Archæan System forms, in Geology (q.v.), the basement division of the stratified series of rocks. The rocks included under archæan system consist principally of crystalline schistose rocks, and attain a thickness of many thousand feet. There is invariably an *unconformity* between them and the strata which happen to rest upon them. It is quite possible that some of the regions of crystalline schists which are described as belonging to the archæan system may really pertain to a later date—because all that can be asserted of such crystalline schists is that they are older than the strata which immediately overlie them. Sometimes these overlying strata are of older, sometimes of younger Palæozoic, or even of Mesozoic and Cainozoic age. Two groups are recognised in the archæan system—the *lower* or 'old gneiss formation,' consisting principally of coarsely crystalline gneiss, along with hornblende-schist, quartzite, and crystalline limestone. The *upper* group, or 'crystalline schist formation,' comprises chiefly mica-schists, chlorite-schists, talc-schists, phyllites, and occasional conglomerates. The archæan system is well developed in many different parts of the globe. It covers considerable areas in the Outer Hebrides and the western parts of Ross and Sutherland, and much more extensive regions in Scandinavia, Finland, and the NW. of Russia. Archæan rocks also form the core or central portion of many mountain-ranges, as the Urals, the Carpathians, the Alps, the Pyrenees, &c. They appear also in many of the hilly tracts of Middle Europe, as in Saxony, Bohemia, and Bavaria. In North America they extend from the region of the great lakes north to the arctic circle, and they also form the nuclei of

many mountain-ranges in the same country. They have been recognised in the coast-ranges of Brazil, in Venezuela, and the Andes; and they likewise occur in India and New Zealand. In Central Europe the lower group passes up conformably into the upper group. But in Canada there is a marked unconformity between the two series—the *lower* (termed Laurentian) attaining a thickness of 30,000 feet, and the *upper* (Huronian), a thickness of 10,000 to 20,000 feet. In one of the crystalline limestones of the Laurentian group, occur the remains of what is believed by Sir W. Dawson and others to have been a massive reef-building Foraminifer (*Eozoön*, q.v.). Other observers deny the organic origin of *Eozoön*, and are of opinion that it is entirely a mineral structure (ophticalcite). By the latter, the archæan system is sometimes spoken of as the *Azoic* (Gr., 'without life') system or formation. Those who think that *Eozoön* is really a fossil, occasionally call the great series of rocks in which it occurs the *Eozoic* formation.

The archæan rocks are often penetrated by mineral veins from which large supplies of various metals have been obtained. Great masses of iron-ore form a marked feature of the archæan system in Canada.

Archæology (Gr. *archaios*, 'ancient,' and *logos*, 'a discourse') is the science which deduces a knowledge of past times from the study of their existing remains. The materials of the science are the relics of the human life of all former ages. Its methods, like those of the natural sciences, are both deductive and inductive. It regards the products of human handicraft which it investigates as manifestations of the ability and purpose of the men who made them. When these products are compared among themselves, the investigation proceeds to the determination of types, and their arrangement in a classified system. Comparison of the classified groups discloses gradations of adaptation and development of character which determine the sequence of the types. These sequences are tested by the associations of characteristic examples in the deposits in which they are found; and the general result is the recovery of such a logical story of the progress of culture and civilisation as the surviving relics of bygone ages are capable of disclosing. But the story thus recovered is not history. It proceeds by simple sequences, and not by a chronological specification of dates and measurement of durations. History deals with events and incidents as manifestations of human motive and action; archæology deals with types and systems as expressions of human culture and civilisation. The archæology of a historic period may be capable of illustrating and supplementing the records of contemporary historians by disclosing a multiplicity of unchronicled details relating to the common life of the people, of which we should have been otherwise left in ignorance. The historic or non-historic character of the time to be investigated has, however, no bearing on the methods of its archæological investigation. These are the same for all times and for all areas. But, as in other sciences whose materials are universally distributed, there is necessarily a limitation of its deductions to the special area investigated. The results of observation show that widely separated areas are characterised by widely different archæological types. As in Zoology or Botany it cannot be predicated of a typical form that it may not vary, or cease to exist in other areas, so neither can it be affirmed of an archæological type that it will necessarily be constant over any hypothetical area. The question which is always to be determined is, What is the area of the occurrence of the type?—

and this is a question of observation, and not of induction. And as archæological types not only differ in different areas, but are known to have differed widely at different times within the same area, it is clear that the science must necessarily imply a series of investigations carried to completely exhaustive results in many different areas of the earth's surface before they can be compared and combined to form a science of archæology in its general or universal sense. But as no single area has yet been exhaustively investigated, the practical scope of archæology, for the present, may be defined to be the prosecution of the investigation to exhaustive results on their own areas by the more cultured nations. The basis of all scientific knowledge of archæology in every national area must be such a general collection of the remains of its human occupation as will be completely representative of all the various manifestations that have characterised the progress of its people towards the existing culture and civilisation. Hence in every country in which culture is not at a low level, a national collection of the monuments and relics of the progress and development of its national culture is now in process of formation. As the scientific knowledge disclosed by these national collections must necessarily increase in precision and value, according to the nearness of the approach of the collection to a thoroughly exhaustive representation of the area from which it is drawn, the science must be progressive in its results, and its conclusions can only be regarded as final when the collection of materials is complete. When the several national collections have reached this stage of representative completeness, a new departure of the science, in the direction, first, of comparative archæology, and secondly, of general archæology, will become possible.

In the meantime, the results of investigations have established, for the greater part of Europe and some parts of Asia, a series of stages of progress of industrial culture, marked by the successive use of stone, bronze, and iron, as materials for the fabrication of cutting tools and weapons. These stages of progress, when applied to a national area like that of Denmark, in which this division of prehistoric culture was first formulated, are spoken of as the Stone Age, the Bronze Age, and the Iron Age of the prehistoric inhabitants of that country. As these terms do not imply absolute divisions of time, and as they cannot be used unless with relation to the condition of a people, it follows that their succession was neither necessarily nor probably synchronous in different areas, and the same has to be inferred of their duration, which cannot be estimated by any known method of science. It has been conjectured that in Denmark the bronze age may have commenced from two to one thousand years B.C., and the iron age at some time close upon the Christian era. It is not at present known what are the definite areas upon the earth's surface, within which the progress of culture has been through these three successive stages. It is known that this succession has not been universal, as many peoples have passed directly from the use of stone to that of iron. An Age of Copper in place of, or in addition to, the age of bronze, has been suggested in some areas of Europe, Asia, and America; and if the observations on which this conclusion rests shall be confirmed by future investigations, the archæological area of the age of copper will be an important element in the development of the science. It is also known that the succession which, in England, France, and some portions of Central and Southern Europe, is distinguished as from the palæolithic to the neolithic division of the stone age, has not been universal; but

it is not known what are the definite boundaries of the area, or areas, within which it occurred; and this also will not be capable of determination until the different national areas have been exhaustively investigated.

Worsaae gives the following approximate chronology of periods for the Scandinavian north: (1) The early Stone Age, at least 3000 B.C. (2) The later Stone Age, about 2000 to 1000 B.C. (3) The early Bronze Age, about 1000 to 500 B.C., when a stone age existed to the north, and an iron age had already come in to the south. (4) The late Bronze Age, about 500 B.C. to the time of Christ's birth, when a pre-Roman age of iron was developed in Central and Western Europe. (5) The early Iron Age, from 1 to 450 A.D., when bronze was still in use in parts of the Scandinavian peninsula. (6) The middle Age of Iron, about 450 to 700 A.D., when foreign Romano-German influence predominated. (7) The later Iron Age, or viking period, about 700 to 1000 A.D., when a stone age still lingered in the extreme north of Finland and Lapland.

The study of archæology in any given area is thus a study of all the remains of man and his works occurring within that area, with the view of determining their relations to each other in time, and ascertaining their typical relations with corresponding remains in other areas. It includes the history of industry and art, and the development of human culture from its lowest to its highest manifestations; and also the history of civilisation, or the progress of aggregate communities, from the first simple principles of combination for mutual helpfulness, to the highest manifestations of social and political organisation.

Applied to the British area, archæology reveals that Scotland, like Denmark, Norway, and Sweden, discloses no evidence of its occupation by man in the palæolithic period of the stone age, when the human species was, in certain other areas of Europe, contemporary with a group of extinct animals; these earliest remains being confined to England south of the Humber. But the whole area of England and Scotland presents traces of the cairn-builders of the closing portion of the stone age, who buried their dead in chambered cairns, and possessed the domestic animals still common in these countries. Their urns, or funereal pottery of fire-baked clay, were wide, shallow, round-bottomed vessels, decorated with rectilinear ornamentation, or pitted with the finger-nail. Their weapons were bows and arrows, tipped with well-made triangular or lozenge-shaped points of chipped flint, and axes of different varieties of polished stone. The bronze age is represented by a different set of burial customs, in cairns that are not chambered, the bodies being deposited singly, in cists of slabs, and accompanied by flat-bottomed urns, tall, and tapering to a narrow base, with rectilinear ornamentation encircling the exterior surface in bands. This system of single burial in cists, in place of aggregate burial in the chambers of a cairn, which distinguishes the bronze age sepulchral deposits from those of the stone age in Britain, prevails not only in the unchambered cairns, but in the barrows or artificial mounds of earth, and common cemeteries, or groups of interments in natural mounds and ridges of gravel and sand, as well as in the monumental cemeteries surrounded by circles of standing stones. The customs of cremation and unburnt burial appear to have existed side by side throughout the bronze age; cremation, however, being the more frequent form in the chambered cairns of the age of stone. The implements and weapons of the bronze age were made of an alloy of copper and tin, in the proportion of about nine parts of copper to one of tin, and were cast in moulds of

stone or hardened clay, and their edges hammered fine and planished with a whetstone. They consist of knives of several varieties of form, daggers, swords, spear-heads, shields, axes of three varieties of shape—flat, flanged, and socketed—chisels, gouges, sickles, &c. The personal ornaments were made of bronze, but frequently also of gold, and consisted chiefly of ring-shaped bracelets, necklets, diadems, and earrings. Throughout the bronze age, flint arrow-heads continued to be used; and polished stone ornaments, such as bracers to protect the wrist from the recoil of the bow-string, and beads and necklaces of jet and amber, were common. The iron age introduces a system of curvilinear ornamentation of peculiar character for the surface decoration of objects of personal use and ornament, which still continue to be made of bronze or gold, though silver is now also common; and all the cutting implements and weapons are made of iron. The burial customs of the iron age are not yet disclosed for Scotland; but in the neighbouring area of the north of England, the custom of burial in barrows, without cists of stones or sepulchral urns, but accompanied by horses and chariots and their harness and furniture, is shown to have prevailed. In the early Christian period, when grave-goods ceased to be buried with the dead, the archæological interest is transferred from the underground phenomena of the burial, to its overground manifestations in monumental symbolism and memorial sculpture. The symbolism appears to have been developed into a system peculiar to the Scottish area; but the art of the memorial sculpture corresponds with that of the illuminated ornamentation of the early Celtic manuscripts of Gospels and Psalters, and with the decorative patterns of such articles of Celtic metal-work, as chalices, crosiers, book-covers, and brooches of the same period. After the 12th century, the Celtic style of decorative art gave way to the European styles, introduced by freer contact with continental influences; but the national style exerted a strong influence upon the monuments of the West Highlands and Islands of Scotland until the Reformation, and lingered in the decoration of brooches of brass and silver, the carving of dirk-handles and powder-horns, and the tooling of leather-coverings for targets, till after the Rebellion.

In former days our knowledge of past times was wholly derived from history and tradition. Their remains were regarded as the work of the gods, or assigned conjecturally to some race or order of historic fame, as the stone circles of Britain were given to the Druids, bronze weapons and implements to the Romans or Phœnicians, and the sculptured monuments of Scotland to the Danes. The professed antiquary of the 18th century, bound by the traditions of scholarly research, did little in the way of original investigation; but he unconsciously laid the foundation of the science by his passion for collecting. When the articles were brought together, classification suggested itself, and general deductions became for the first time possible. Thus flint axes and arrow-heads, stone whorls and variegated beads, ceased to be credited with superstitious attributes as thunderbolts, elf-shot, amulets, and adder-stones, and came to be recognised as materials of science, capable of being utilised for the increase of knowledge. The formation of societies for the promotion of the study was a great step in advance. The Society of Antiquaries of London was incorporated in 1751, and the Scottish Society in 1780. The number of provincial and local societies has increased enormously in recent years, and their publications form an extensive body of archæological literature. The first systematic researches

among the actual remains of antiquity were made by Rev. Bryan Faussett among the Anglo-Saxon tumuli of the Kentish Downs from 1757 to 1773. He was followed by Rev. James Douglas, who published his *Nenia Britannica, or a History of British Tumuli*, in 1793. Sir Richard Colt Hoare issued an account of his explorations of the tumuli of the Wiltshire Downs in 1820. More recently, the investigations of the tumuli of Derbyshire by Bateman, and of the barrows of Yorkshire and the north of England by Greenwell and Rolleston, have supplied much authentic information of the burial customs of primitive times.

An extraordinary impetus was given in another direction by the announcement in 1847 of the discovery by M. Boucher de Perthes, in the valley of the Somme, of certain rude types of implements of flint in river-gravels inclosing remains of extinct animals. Though at first received with incredulity, these discoveries were afterwards amply verified, and the river-drifts of England, from Salisbury Plain in the south to the Yorkshire Ouse in the north, were found to yield the same forms of implements in similar association with remains of such extinct animals as the mammoth and woolly-haired rhinoceros; thus extending the antiquity of man far beyond the period of the tumuli and the surface finds, to which his remains had been hitherto supposed to be confined. Dr Schmerling, in 1833, had published his researches in the caves of Liège, in which he had found flint implements of similar types, also associated with remains of extinct animals; and his discoveries were subsequently confirmed and extended by those of M. Dupont in the caves of Belgium, of Messrs Lartet and Christy in the caves of Dordogne in France, and of Mr Pengelly and Professor Boyd Dawkins in those of England. More recently, similar implements of quartzite have been found by Mr Bruce Foote and others in the laterite beds of Madras, and occasional discoveries of the same nature have been made in Spain, Italy, Greece, and Asia Minor. From the similarity both of the implements and of the associated fauna of the drift and of the caves, they are attributed to the same period, and have been styled *Palæolithic*, or of the older division of the stone age, in contradistinction to the relics of the *Neolithic*, or later division of the stone age. The discovery of the Swiss lake-dwellings in 1854, and their systematic description by Dr Keller, gave another impulse to investigation which extended the area of this phase of primitive life to Italy, Germany, and Austria. Lake-dwellings had been previously known and described by their Celtic name of crannogs in Scotland and Ireland, although their character and contents had been but little investigated. To elucidate the ancient modes of life, the habits and customs of modern savages have been studied, and the results applied to archæology by Lubbock, Tylor, and Burton. Sociology, or the phenomena and methods of the development of civilisation, have been investigated by Herbert Spencer and Sir Arthur Mitchell. The exploration of historic sites, of which Layard was the pioneer at Nineveh, has been recently continued, with very important results, by Schliemann in Asia Minor and Greece, by Flinders Petrie in Egypt, and by Captain Conder in Palestine and Syria.

There are lectureships of archæology at Oxford, Cambridge, and Edinburgh, and English and American schools of archæology have been recently founded at Athens. Nearly all European governments have taken measures for the protection of ancient monuments; and in Denmark, Holland, and France, the government has provided for the purchase of the sites of such monuments from the owners, in order to preserve them as national property. Special pro-

vision has also been made for the ingathering of prehistoric relics to the different museums of national antiquities. The Royal Museum of Old Northern Antiquities at Copenhagen, established in 1816, and classified by Thomsen and Worsaae on the basis of the succession of the three ages now universally adopted, contains a completely representative series of the prehistoric antiquities of Denmark, one of its special features being the remains from the Kjøkkenmøddings of the Baltic coast. The National Museum of France at St Germain, near Paris, has for its special feature the extensive collections from the river-drifts and the Dordogne caves. The national museums of Norway and Sweden, on the other hand, exhibit the remains of the iron age as they are nowhere else represented; while the museums of Zürich and Constance are specially rich in the lake-dwelling remains so characteristic of Switzerland. At Rome, the new Archæological Museum, under the direction of Pigorini, is rapidly filling with the prehistoric remains of Italy; while the Vatican collection is rich in the remains of the Early Christian period. At Naples, the objects disinterred from the buried cities of Herculaneum and Pompeii are gathered into a museum of unrivalled interest. At Athens, the discoveries of Schliemann, and the explorations of the Archæological Society of Greece, have created a national museum of special importance. In Egypt, the museum at Boulak, a suburb of Cairo, contains the results of the explorations of the tombs of the kings of the early dynasties, and an extensive collection of general antiquities from the valley of the Nile. At Washington, the United States National Museum already rivals the largest establishments of the Old World in the extent and variety of its ethnological collections. The British Museum in London, established in 1755, though rich in its general collections, possessed no department of British antiquities till a full century afterwards. The Scottish National Museum, founded by the Society of Antiquaries of Scotland in 1780, and maintained by them till 1856, when it was gifted to the nation and established as a national institution, and the Museum of the Royal Irish Academy at Dublin, both possess fairly representative collections of national antiquities. For American Archæology, see AMERICA.

The following books of reference on the archæology of the special areas, or on the special branches of which they treat, may be usefully consulted: GREAT BRITAIN AND IRELAND—Evans, *Stone Implements, Ornaments, &c. of Great Britain and Ireland*; and *Bronze Implements, &c.*; Davis and Thurnam, *Crania Britannica*, 2 vols.; Boyd Dawkins, *Early Man in Britain*. Amongst the numerous archæological articles in this work are the following:

Armour.	Coffin.	Picts' Houses.
Avebury.	Cromlech.	Pottery.
Barrows.	Dolmen.	Round Towers.
Beehive Construction.	Earth-houses.	Sculptured Stones.
Brochs.	Flint Implements.	Standing Stones.
Bronze Age	Glass.	Stone Age.
Burial.	Iron Age.	Stone Circles.
Cairn.	Kent's Cavern.	Stonehenge.
Caves.	Kitchen Middens.	Teocalli.
Celt.	Lake-dwellings.	Urn.
	Man (Antiquity of).	Vitrified Forts.

Archæopteryx, an extinct bird, the remains of which have been obtained in the well-known Solenhofen lithographic stone—a limestone of Jurassic age—which is quarried at Aichstadt in Bavaria. Only two specimens of the archæopteryx are known—one in the British Museum, and the other at Berlin. The bird appears to have been about the size of a rook. It was at first believed to be a reptile, then a transition form between reptiles and birds, but Professor Owen showed that it was a true bird. The anomalous structure which led the first observers astray was the tail, which, instead of consisting of a few shortened vertebrae united together into a coccygean bone, as in all

Remains of Archæopteryx in Solenhofen Stone.

known birds, recent or fossil, was formed of twenty elongated vertebrae, each of which supported a pair of quill-feathers. The metacarpal bones were not ankylosed, as in all known birds, from which it also differed in having two free claws belonging to the wing. The long lizard-like tail is not so anomalous as it at first sight appears, for in the early embryonic condition of the bird, the vertebrae are distinct and separate, and the anastomosis

which invariably takes place in the subsequent development of the embryo does not occur in the archæopteryx, so that it may be considered to exhibit the temporary embryonic condition of the bird as a permanent structure; and that this is the true position of this singular fossil is further established by the existence of other features which are found only in birds. These are the ornithic structure of the wings and legs, the occurrence of feathers, which are confined to birds, and the existence of a merry-thought (furculum), which is found in no other class of animals. An elevation on the surface of the slab containing the fossil is believed by many to be the cast of the interior of the skull, and it corresponds remarkably in size and form with the cast from the skull of a rook. It is probable that the jaws were furnished with teeth sunk in sockets, like the toothed birds of cretaceous times.

Archangel, the chief city in the Russian government of Archangel, is situated about 40 miles above the junction of the river Dwina with the White Sea. It is the seat of an archbishop, and owes its name to the monastery of St Michael. Archangel is the chief commercial city for the north of Russia and Siberia, and is visited by numerous vessels—especially British—from June to October, the port being clear of ice only during that period. The harbour is about a mile below the town, at the island of Solombaly; and 12 miles below there is a government dockyard and merchants' warehouses. The houses are built chiefly of wood. The finest edifices are the bazaar or mart (1668-84), and the marine hospital. Archangel has an ecclesiastical college, one Protestant and twelve Greek churches, schools for engineering and navigation, a gymnasium, a naval hospital, government bank, &c. The chief articles of traffic are fish, flax, oats, linseed, tar, pitch, rosin, train-oil, skins, furs, timber, wax, iron, tallow, bristles, caviare. The manufactures include cordage, canvas, linen, leather, beer, and sugar. It is connected by river and canal with a great part of European Russia. The town, which is the oldest seaport in the empire, dates its rise from a visit paid by the English seaman, Chancellor, in 1553; an English factory was soon afterwards erected, and a fort was built in 1584. When Peter the Great visited Archangel in 1693-94, the town was in the height of its prosperity, but his later policy after the founding of St Petersburg caused the town to decline. Since receiving the same privileges as the latter town, in 1762, Archangel has increased in prosperity. Pop. (1880) 19,540.—The government of Archangel has an area of 331,505 sq. m., and had in 1883 a population of 318,429. The population, formerly Finnish, is now chiefly Russian. The land lying within the arctic circle is desolate and sterile, and the people support themselves chiefly by the chase. Southward, immense forests constitute the chief wealth of the country. Gold, naphtha, and salt are found in various parts.

Archangel. See ANGEL.

Archangel, a name sometimes applied to *Lamium purpureum* and *L. Galeobdolon*. See DEADNETTLE, but cf. also ANGELICA.

Archbishop (Gr. *arch*-, and *episcopos*, 'over-seer') is the title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province, and also exercises episcopal authority in his own diocese. Occasionally, however, the title has been bestowed upon a prelate of a famous city, without his being made a metropolitan and having suffragans under him. The title arose, in the 3d and 4th centuries, from the provincial synods being held once or twice a year in

the chief town of the province under the presidency of the bishop of the place. Another cause of the origin of the title is said to be the custom of planting new bishoprics as Christianity spread, a slight supremacy being still retained by the original chief pastor over those newly appointed. In the Oriental Church, the archbishops are still called 'metropolitans,' from the circumstance first mentioned. In the African Church, on the other hand, the term used was 'primus.' The great archbishoprics of the early Church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the 6th century, the Archbishop of Rome has claimed exclusively the name of Pope (*papa*), which early fathers—e.g. St Jerome—apply to all bishops, and occasionally even to presbyters. There is an official letter by Justinian, addressed to 'John, Archbishop of Rome and Patriarch;' and several ecclesiastical constitutions are addressed to 'Epiphanius, Archbishop of Constantinople and Patriarch.' The synod of Antioch, in 341, assigned to the archbishop the superintendence over all the bishoprics, and a precedence in rank over all the bishops of the church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the Patriarchs (q.v.) towards the end of the 4th and during the 5th century, and still more to the pope in the 9th. The archbishops still retained jurisdiction, in the first instance, over their suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in, the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the church; the dispensation of indulgences, and the like. The archbishops further enjoyed the honour of having the cross carried before them in their own archiepiscopate, even in presence of the pope himself, and of wearing the *pallium*.

In England there are two archbishops, of whom the one has his seat at Canterbury, the capital of the ancient kingdom of Kent; the other at York, the capital of Northumbria. But though as ruling over a province in place of a single diocese, both have enjoyed the rank of metropolitans from the first, the Archbishop of Canterbury has all along enjoyed, not merely precedence as the successor of Augustine and the senior archbishop, but the possession of a pre-eminent and universal authority over the whole kingdom. This pre-eminence is marked in the titles which they respectively assume—the Archbishop of Canterbury being styled the Primate of all England (*metropolitanus et primas totius Angliæ*), whilst the Archbishop of York is simply called Primate of England (*primas et metropolitanus Angliæ*). It is also indicated by the places which they occupy in processions—the Archbishop of Canterbury, who has precedence of all the nobility (excepting those of the blood royal), not only preceding the Archbishop of York, but the Lord Chancellor being interposed between them. Previous to the creation of an archbishopric in Ireland, the authority of the Archbishop of Canterbury extended to that island. The amount of control which belongs to an archbishop over the bishops of his province is not very accurately defined; but if any bishop introduces irregularities into his diocese, or is guilty of immorality, the archbishop may call him to account, and even deprive him. In 1822 the Archbishop of Armagh, who is primate of all Ireland, deposed the Bishop

of Clogher on the latter ground. Writers, however, who maintain the *jus divinum* of bishops over presbyters, do not claim more than a *jus humanum* for a metropolitan over his suffragans; and assert that, though a bishop may overrule a decision made by a majority of his clergy, an archbishop is bound to give way to a majority of the bishops of his province. To the Archbishop of Canterbury belongs the honour of placing the crown on the sovereign's head at his coronation; and the Archbishop of York claims the like privilege in the case of the queen-consort, whose perpetual chaplain he is. The province of the Archbishop of York, consisting of the six northern counties and Cheshire, includes nine dioceses. The rest of England, with Wales, forms the province of the Archbishop of Canterbury, and includes 24 dioceses. The dioceses of the two archbishops—i.e. the districts in which they exercise ordinary episcopal functions—were remodelled in 1836. The diocese of Canterbury comprises Kent, except the city and deanery of Rochester, and some parishes transferred by this act; a number of parishes in Sussex called 'peculiars;' with small districts in other dioceses, particularly London. The diocese of the Archbishop of York embraces the county of York, except that portion of it now included in the dioceses of Ripon and Manchester, and some other detached districts. The election of an archbishop does not differ from that of a Bishop (q.v.); nor is the form of consecration essentially different, excepting that the oath of obedience to the archbishop is necessarily omitted. He also writes himself 'by Divine Providence;' a bishop being 'by Divine Permission;' and has the title of 'Grace,' and 'Most Reverend Father in God,' whilst a bishop is styled 'Lord,' and 'Right Reverend Father in God.' The archbishop is entitled to present to all ecclesiastical livings in the disposal of diocesan bishops, if not filled up within six months; and every bishop, whether created or translated, was formerly bound to make a legal conveyance to the archbishop of the next avoidance of one such dignity or benefice belonging to his see as the archbishop shall choose.

In England there is but one Roman Catholic archiepiscopal see, that of Westminster; in Scotland there are two, St Andrews and Edinburgh, and Glasgow. In Ireland there are two Protestant and four Roman Catholic archbishops. Of the former, the Archbishop of Armagh is primate of all Ireland; the Archbishop of Dublin being primate of Ireland. They formerly sat alternately in the House of Lords; the three bishops who along with them represented the Church of Ireland being chosen by rotation.

The United States are divided by the Roman Catholic church into twelve ecclesiastical provinces, each under an archbishop, and each including several dioceses. The divisions are known as the provinces of Baltimore, Boston, Chicago, Cincinnati, Milwaukee, New Orleans, New York, Oregon, Philadelphia, St Louis, San Francisco, and Santa Fé. There are no Protestant archbishops.

Archdeacon, an ecclesiastical dignitary whose jurisdiction is immediately subordinate to that of the bishop. The archdeacon originally was simply the chief of the deacons, who were the attendants and assistants of the bishop in church affairs. His duties consisted in attending the bishop at the altar and at ordinations, assisting him in managing the revenues of the church, and directing the deacons in their duties. From being thus mere assistants, archdeacons in the 5th century began to share the bishop's powers, and step by step attained to an authority in many respects distinct from that of the bishop, and claimed a jurisdiction proper to themselves, and the right to appoint their own subordinates. Several synods protested

against the innovation, and in the 13th century their powers were limited by the establishment of episcopal courts. Their dignity and influence is now very much reduced in the Catholic Church. There was formerly one archdeacon for each diocese in England, but the act following the report of the Ecclesiastical Commissioners in 1836, has made two the minimum number, and in some dioceses there are four. No person can be appointed an archdeacon till he has been six years complete in priest's orders. The duty of parochial visitation has long been regarded as belonging specially to this office, and it was by its exercise mainly that the archdeacons attained to the dignity of ordinary instead of delegated jurisdiction. Even in performing this function, however, and in holding general synods or visitations, ordering repairs of churches, and the like, the archdeacon is properly to be regarded as being what the canon law called him, 'the bishop's eye.' The archdeacon is *ex officio* a member of Convocation (q.v.), and in his court hears from the churchwardens any representations of public scandal. The judge of the archdeacon's court, when he does not preside, is called 'the official.' There is an appeal to the Court of the Bishop, or in the case of an archdeacon of an archbishopric, to the Court of Arches. See DEACON, DEAN, PRIEST.

Archduke (Ger. *Erzherzog*). Archduke and archduchess are titles now borne by all the sons and daughters of an emperor of Austria, and by their descendants through the male line. The title of archduke was gradually assumed, since 1359, by the Dukes of Austria, as a mark of precedence over the other dukes of the empire, and was formally conferred on them by the Emperor Frederick III. in 1453, who himself, as duke, was the first recipient of the imperial gift.

Archegoniata. See CRYPTOGRAMMITE PLANTS.

Archegonium. See CRYPTOGRAMMITE PLANTS, FERN, &c.

Archegosaurus, a remarkable fossil saurian reptile. It had four long, slender digits, which obviously supported a longish narrow-pointed paddle,

Archegosaurus: a, section of a tooth; b, scales.

adapted for swimming. Externally, the body was protected by a covering of oblong quadrangular scales, which are preserved in some specimens.

Several species have been described. Goldfuss considered them to be a transition state between the fish-like batrachia and the lizards and crocodiles. Professor Owen has subsequently described this fossil; he makes it a remarkable connecting link between the reptile and the fish, and on these grounds: It is related to the salamandroid-ganoid fishes by the conformity of pattern in the plates of the external cranial skeleton, and by the persistence of the *chorda dorsalis*, as in the sturgeon, while it is allied to the reptiles by the persistence of the *chorda dorsalis* and the branchial arches, and by the absence of the occipital condyle or condyles as in Lepidosiren, and by the presence of labyrinthine teeth as in Labyrinthodon, which, however, also ally it to the ganoid Lepidosteus.

There is thus in the archegosaurus a blending together of the characteristics of reptile and fish in one animal. It occupies a position between, and equally related to, the salamandroid-ganoid fishes on the one hand and the labyrinthodont reptiles on the other, while the latter conduct us through the Lepidosiren to the perennibranchiate batrachia.

Archelaus, (1) one of the Heraclidae, the mythical founder of the royal house of Macedonia.—(2) A philosopher of the Ionic school, born at Athens, or, according to others, at Miletus. He was a scholar of Anaxagoras, and flourished about 450 B.C. He was the first to maintain the spherical form of the earth, which he inferred from his observation that the sun does not rise and set simultaneously at all parts of the earth, as must be the case were it a flat surface.—(3) King of Macedonia, a natural son of Perdiccas II., obtained the throne by murdering the rightful heir in 413 B.C. His reign was far better than its commencement, as he introduced several salutary measures, and was a generous patron of art and literature. His palace was splendidly adorned with paintings by Zeuxis, and Euripides was among his guests. He is believed to have been murdered by his favourite, Craterus, in 399.—(4) A distinguished general under Mithridates the Great, sent to Greece with a fleet and a large army to oppose the Romans in 87 B.C. He was defeated by Sulla at Chæronea, and a second time, with immense loss, at Orchomenos, in Boeotia, in 86. Unjustly suspected of treason, Archelaus went over to the Romans at the outbreak of the second war in 81.—(5) The son of the preceding, married Berenice, daughter of King Ptolemy Auletes, in 56 B.C., and ruled over Egypt for the short space of six months during the banishment of Ptolemy.—(6) Ethnarch of Judæa, son of Herod the Great, succeeded his father in 1 A.D., and maintained his position against an insurrection raised by the Pharisees. His heirship to the throne being disputed by his brother Antipas, Archelaus went to Rome, where his authority was confirmed by Augustus, who made him Ethnarch of Judæa, Samaria, and Idumæa, while his brothers, Antipas and Philip, were made tetrarchs over the other half of the dominions of Herod. After a reign of nine years, he was deposed by Augustus, on account of his cruel tyranny, and banished to Vienne, in Gaul, where he died. His territories were added to the Roman province of Syria.

Archenholz, JOHANN WILHELM VON, born at Dan-

zig in 1745, served in the army, passed ten years in England (1769-79), and died near Hamburg in 1812. His *Geschichte des Siebenjährigen Krieges* (1793) reached an eleventh edition in 1879. He also wrote *England und Italien* (1785); *Annalen der Britischen Geschichte* (20 vols. 1789-98); biographies of Queen Elizabeth and Gustavus Vasa, &c.

Archer Fish, a name given to certain small East Indian fishes of the Acanthopterygious family of Squamipennes or Chaetodontidae, which have acquired the unique habit of catching insects by spouting water from their mouths. The drops of water are surely aimed, and enveloping the desired insect, cause it to fall into the water, where it is instantly seized as prey. *Toxotes jaculator*, one of these species, is a fish about 6 or 7 inches in length, a native of Java and other parts of the Indian Archipelago, and is that to which the name archer fish has been more strictly appropriated. It can

project a drop of water to the height of 4 or 5 feet. *Chelmon rostratus*, also a Javanese fish, possesses the same power, and the Chinese in Java keep it in

Archer Fish (*Toxotes jaculator*).

jars for their amusement, causing it to practise its art by placing insects within its range.

Archery is the art of shooting with the bow and arrow. The use of these weapons was probably known to man at a very early period of his history, and triangular flint arrow-heads, chipped into the requisite shape, are found in all parts of the world, showing that they must have been known and largely used at a period anterior to the discovery of the working of metals. The bow is mentioned in Scripture as having been used in patriarchal times, and we know that all the leading nations of antiquity were acquainted with it. Assyrian sculpture and Egyptian hieroglyphics testify to its use among these peoples, and the Thracians, Cretans, Parthians, and Numidians were held in high estimation as archers. Homer frequently mentions bows; that of Pandarus was made of a goat's horns 'joined and shaped' with artful toil, and tipped with gold. The poet alludes to it as being used, not only as a weapon of war, but in the sports of the arena, and describes a contest at what would now be called 'shooting at a popinjay' or bird fastened to the top of a mast. The Romans, too, did not disdain the use of the bow in warfare, though it probably did not form part of the arms of the regular legions, but was confined to the auxiliary troops. Procopius mentions that in Justinian's African campaign, the cavalry were clad in coats of mail, and were armed with swords and bows and arrows. The emperors themselves occasionally displayed their skill with the bow, and we are told that Gratian, Commodus, and Domitian were all accomplished archers. Asia, however, and not Europe, must be considered the home of the bow, and almost all the oriental nations have excelled in its use. The practice of archery is still a favourite sport among the Tartars, Chinese, and Persians; while the Scythians gave their name to a peculiar shape of bow like a crescent moon, which was at one time extremely popular in the East. But no one country or continent can lay claim to the bow as exclusively its own: wherever man is found, he is almost certain to have taken with him his bows and arrows. They are used within the frigid regions of the north, as well as under the burning tropical sun. The Hottentots, Bushmen, South Sea Islanders, and the Indians of South America, and a few still in North America, are expert in the use of the bow. As a part of military warfare, however, archery was never brought to greater perfection than it was in

England in the time of Edward III. That monarch devoted much attention to the encouragement of the art among his people, and the consequence was that English bowmen were the foremost in the world; and their prowess was amply proved by the large share they contributed to the successes of Cressy, Poitiers, Agincourt, and other battles. The English archers were all armed with the long-bow, while the French principally depended on the arbalest or crossbow, a powerful, but clumsy and unwieldy weapon. Archers continued to form a part of the English army long after the introduction of gunpowder; in 1572 Queen Elizabeth promised to place at the disposal of Charles X. six thousand men, of whom the half were archers. Archery decayed as firearms came into use. Charles I. endeavoured to revivify the art; and at the breaking out of the civil war, an attempt was made to raise a regiment of archers for the service of the king. Highlanders armed with bows, arrows, and quivers, were in the Covenanters' army at Duns Law in 1639. Cossacks similarly armed entered Paris in 1814.

In Scotland, archery never took such deep root as in the sister country, notwithstanding frequent statutory enactments regarding it. Doubtless owing to legislative encouragement, archery was, however, practised with some success throughout the country; but the people did not seem to take to it as they did in England, and Scottish archers never distinguished themselves on a field of battle.

Bows have assumed various forms in different countries, and have been made of several substances. The bows used in England were at first what are called *self bows*—i.e. made of one piece of wood, generally yew, throughout. Yew, however, being often difficult to procure, *backed bows* were introduced formed of two pieces of wood glued and pressed firmly together; and at the present time bowyers largely make *three-wood bows*, a method which is found to give additional pliancy and strength to the weapon. The weight of bows varies according to the requirements of the archer. A lady's bow may be bent with a pull not exceeding 28 or 30 lb., while a man may use one of double that strength. On an average, however, it will be found that a bow of about 42 lb. is most suited to ranges up to a hundred yards, while for greater distances one of between 50 and 60 lb. may be employed.

The manner of shooting with the bow has varied in different periods and peoples. In ancient times, it seems to be certain that the bow was pulled towards the breast, but it was latterly discovered that by drawing it towards the chin or right ear, much greater force was obtained. Of the different modes of quitting the arrow, an elaborate monograph has been written by an American author, Mr Morse. What he designates severally as the 'primary,' 'secondary,' and 'tertiary' release, have all the same inherent fault—viz. that the arrow is held between the finger and thumb while being quitted. This form of release is still practised by some of the North American Indian tribes. The 'Mediterranean loose,' as practised for ages by nations north and south of that sea, is the best practical mode of releasing the arrow. In it the bow-string is drawn back with one, two, or three fingers, or with one and two only, the balls of the fingers clinging to the string, the terminal joints slightly flexed, the arrow kept in its place between the first and second fingers; the thumb straight, taking no part in the release. This method of quitting is found to be practised in regions as far apart as Siberia and the Andaman Islands. Assyrian sculptures show both the primary and the Mediterranean release, but it is probable that the latter was introduced only after the 9th century B.C. It

is supposed, however, to have been known to the Egyptians long before that date.

There is no doubt that early training and constant practice conduce to a wonderful degree of accuracy in the art of shooting with the bow, but the record of many feats of the kind must be taken with a considerable amount of caution; the amount of exaggeration contained in many such narratives has probably given rise to the proverbial phrase, 'drawing the longbow.' As a general rule, it may be held that at a greater distance than a hundred yards, great accuracy of aim is not attained, though marks may occasionally be hit at double that distance. Longer and lighter arrows are used for shooting at the greater distances; for butt shooting they are shorter, heavier, and blunter in the point. It was the boast of the English archers of the olden time that every man pulled a 'cloth-yard shaft.' Such an arrow, however, would be too heavy for very long distance shooting. One of the longest recorded shots in modern days was made with a very light arrow of about 25 inches length, by the secretary to the Turkish embassy in London, in 1794. He shot against the wind 415 yards, and back again with the wind 463 yards. This, of course, was a mere trial of distance shooting, and did not profess to be aimed at any particular mark.

The old English arrow was made of ash, weighed from 20 to 24 pennyweights, and was tipped with steel and feathered with goose feathers. South Sea Islanders show great ingenuity in tipping and barbing their arrows with fish bones and teeth. In South America the arrow-heads are steeped in a strong vegetable poison called ourari or woorali, the basis of which is the juice of *Strychnos toxifera*, and which has fatal results in a surprisingly short time. The Bushman employs serpent poison and euphorbia juice. Putrid flesh is said to be used in some South Sea Islands, the poisonous effect of which is more frequently painful than fatal.

The ordinary mode of practising archery as a pastime, with most of the clubs in England, is shooting at targets placed at distances varying from 50 to 100 yards apart. The targets are 4 feet in diameter, and have a gold spot in the centre surrounded by rings coloured red, blue, black, and white with a border of green. Each of these rings possesses a different value, every hit in the gold being counted nine, in the red seven, in the blue five, in the black three, and in the white one. Whoever gets most value in hits wins the match. Another method of shooting is practised by some clubs, especially by the Royal Company of Archers in Scotland; in this, the targets are placed 180, or even 200 yards apart, and are only 3 feet across, or even less. The arrows used are lighter and longer than in ordinary target shooting, and every arrow hitting the target on whatever part, or 'making a clout,' as it is termed, scores two. Should no arrow hit, the nearest within four bows' lengths counts one.

There are a large number of clubs and societies formed for the practice of archery throughout Great Britain. Of these, the oldest is, curiously enough, a Scottish society—the Royal Company of Archers—who constitute the sovereign's Body-guard for Scotland. Their records extend back to 1676, and there are traces of an earlier existence. Almost every notable Scottish family has been at some time or other represented in its ranks. Its affairs are directed by a council, but there are a large body of field-officers; the captain-general—who is always a nobleman of high rank—being Gold Stick for Scotland, the corresponding Gold Stick in England being held by the colonel of the Life Guards. In terms of a charter granted the Royal Company in 1703 by Queen Anne, they perform a service of presenting three barbed arrows to

the sovereign when residing at Holyrood. Queen Victoria had this *reddendo* presented three times. There are many ancient prizes competed for in the Royal Company, including one of the value of £20 annually presented by the Queen.

The oldest existing society of archers in England, if we except the Honourable Artillery Company of London (which was originally a body of archers incorporated by Henry VIII.), is the Royal Toxophilite Society, founded by Sir Ashton Lever in 1780. The Woodmen of Arden is another old society, having been founded five years later. There are about a hundred archery clubs throughout the kingdom. See Ford's *Theory and Practice of Archery* (new ed. by Butt, 1887). Ascham's *Toxophilus* (1545) is a monument of English, and a sound treatise on archery in his day.

Archies, COURT OF, a court belonging to the Archbishop of Canterbury, anciently held in the church of St Mary-le-Bow (*S. Maria de Arcubus*) in London. The presiding judge is called the Dean of Archies. His office has long been united with that of the archbishop's principal official; and the Public Worship Regulation Act of 1874 provided that the same judge should also become the principal official of the Chancery Court of York. See ECCLESIASTICAL COURTS.

Archil, or ORCHIL (Fr. *orseille*; Span. *archilla*; Ital. *orcello*), is a colouring substance obtained from various species of lichens. The archil is not originally present in the lichens, but is developed during a process of putrefaction and fermentation. The lichens, collected from rocks near the sea, are cleaned, ground into a paste with water, placed in tanks, and ammoniacal liquids—such as purified gas liquor or stale urine—added; when, by the combined influence of the ammonia, air, water, and the constituents of the lichens, a violet-coloured matter is generated, which appears for a time to dissolve in the water, but finally falls to the bottom of the vat in the condition of a moist powder or paste. The latter is then mixed with some substance like chalk or stucco, to give it consistence. Archil is soluble in water and in alcohol, to either of which it imparts a violet colour with a good deal of a crimson hue. It contains orcein, which can be obtained as an amorphous red powder, and to which it owes its tinctorial power. It is much employed in the dyeing of silks; but though a brilliant lilac hue is imparted to the fabric, the colour is not a permanent one, being easily acted upon by the rays of the sun. Hence the cloth is first dyed lilac by another colouring matter, and is then passed through an archil dye, which imparts its brilliant hue. Archil is seldom employed to dye cottons, but it is often used, along with indigo, in the dyeing of woollen cloth. Cudbear (q.v.) and Litmus (q.v.) are analogous to archil, and are obtained from the same lichens. The lichens which yield the best archil in largest quantity are *Rocella tinctoria* and *fuciformis*. The former is called the *Archil* plant; it grows very sparingly on the south coast of England, but is obtained in large amount from the Canaries and Cape de Verd Islands, and from the Levant. It is of a substance between cartilaginous and leathery, roundish, pretty erect, branching in a dichotomous manner, of a grayish-brown colour, with powdery warts (*soredia*)—the *apothecia* (see LICHENS), orbicular, flat, horny, almost black. That from the Canary Isles is generally regarded as the best. It seldom exceeds the thickness of a pin, and is about an inch and a half in length. *R. fuciformis* now yields perhaps more of the Archil or Orchella weed of commerce than *R. tinctoria*. It differs from *R. tinctoria* chiefly in being not rounded, but flat, and in having the *apothecia* very distinctly

bordered. It grows in similar situations, and is also a native of Britain, but is abundant only in warmer climates, as on the coasts of Africa, Madagascar, &c.

Archilochus OF PAROS flourished about 714-676 B.C., and is regarded as the first of the Greek lyric poets, although the origin of the elegy is claimed for Callinus. Glimpses of his life, especially of the calamities which befell him, were frequently given in his writings. His father's name was Telesicles, his mother was a slave called Enipo. At an early age, becoming entangled in political contests, he abandoned his native place, and led a colony of the citizens to Thasos. While here, as he informs us in some extant verses, he lost his shield in a battle against the Thracians. Subsequently he was banished from Sparta, to which he had gone, either for his personal cowardice or because of the licentiousness of his verses. Having returned to Paros, he took part in the war which broke out betwixt it and Naxos, in the course of which he lost his life. The Delphian oracle pronounced a curse upon his slayer. He was distinguished for the rich variety and vigour of his lyrics. But the most noted characteristic was his satirical bitterness, inasmuch that 'Archilochian bitterness' and 'Parian verse' became proverbial. He scourged his enemies in the most merciless fashion. It is said that Lycambes, who had promised his daughter Neobule in marriage to Archilochus, having failed to fulfil the promise, was so severely satirised by the poet, that to escape ridicule both father and daughter hanged themselves. Among the ancients, Archilochus was ranked with Homer, Pindar, and Sophocles. Even Plato calls him 'the very wise.' Horace, who largely imitated him in his metres, says that 'rage armed Archilochus with his own iambus'—thus emphasising the fact that to Archilochus we owe the application of iambic verse to satire. One of the forms he often used was called after him *Archilochian verse*. He also used trochaic verse, and many of his poems were hymns, elegies, and epodes. The best editions of his fragments are those of Schneidewin and Bergk.

Archimandrite (Gr. *archi*-, 'chief,' and *mandra*, 'a fold' or 'a convent'), the title of the highest order of superiors of convents in the Greek Church. See ABBOT.

Archimedes, the most celebrated of ancient mathematicians, was born at Syracuse about 287 B.C. He is said to have been a kinsman of King Hiero, though he seems to have held no public office, but to have devoted himself entirely to science. In regard to mathematics, we cannot estimate fully the merits of Archimedes without an exacter knowledge of the state of the science as he found it; we know, however, that he enriched it with discoveries of the highest importance, on which modern mathematicians have founded their methods of measuring curved surfaces and solids. Euclid considers only a few curved figures in relation one to another, but without comparing them with rectilinear surfaces and solids. The theorems necessary to this transition are laid down by Archimedes in his treatises 'on the Sphere and Cylinder,' 'on Spheroids and Conoids,' and 'on the Measurement of the Circle.' His demonstration that the area of a segment of a parabola is two-thirds of the inclosing parallelogram, is the first real example of the *Quadrature* (q.v.) of a curvilinear space. In his treatise on spirals, he rises to yet higher investigations, which, however, are not very easily understood, even by masters of the subject.

Archimedes is the only one of the ancients that contributed anything of real value to the theory of

mechanics and to hydrostatics. He first established the truth that a body plunged in a fluid loses as much of its weight as is equal to the weight of an equal volume of the fluid. It was by this law that he determined how much alloy the goldsmith, whom Hiero had commissioned to make a crown of pure gold, had fraudulently mixed with the metal. The solution of the problem suggested itself to him as he was entering the bath, and he is reported to have been so overjoyed as to run home naked, exclaiming: '*Eureka! Eureka!*' (I have found it! I have found it!) His boast, that if he had a fulcrum or stand-point, he could move the world, betrays the enthusiasm with which the extraordinary effects of his newly invented machines inspired him. Among the numerous inventions ascribed to him is that of the endless screw, and the Archimedes Screw (q.v.). During the siege of Syracuse by the Romans, he exerted all his ingenuity in the defence of the city. Polybius, Livy, and Plutarch speak with astonishment of the machines with which he opposed the attacks of the enemy. The improbable story of his having set fire to the ships by means of mirrors, rests on later narratives. When the Romans took the city by surprise (212 B.C.), Archimedes, according to the tradition, was sitting in the public square lost in thought, with all sorts of geometrical figures before him drawn in the sand. As a Roman soldier rushed upon him, he called out to him not to spoil the circle! But the rude warrior cut him down. According to his own direction, a cylinder inclosing a sphere was engraved upon his tombstone, in commemoration of his discovery of the relation between these solids—a discovery on which he set particular value. When Cicero was in Sicily as quaestor (75 B.C.), he found the tomb hid among briars. His extant works, written in Doric Greek, were edited by Torelli (Oxf. 1792), and Heiberg, with a Latin translation (3 vols. Leip. 1880-81).

Archimedes, THE PRINCIPLE OF, is one of the most important in the science of Hydrostatics, and is so called because the discovery of it is generally ascribed to the Syracusan philosopher. It may be thus stated: A body when immersed in a fluid weighs less than it does in vacuo by the weight of the fluid it displaces; or, A fluid sustains as much of the weight of a body immersed in it as is equal to the weight of the fluid displaced by it (see HYDROSTATICS). It is proved experimentally in the following way: A delicate balance is so arranged that two brass cylinders, A and B, may be suspended from one of the scale-pans, the one

under the other. The lower cylinder, B, is solid, or closed all round, and fits accurately into the upper cylinder, A, which is hollow. When the two cylinders are placed under the one scale, pan-weights are placed upon the other until perfect equilibrium is obtained. The cylinder B is now immersed in water, and in consequence, the equilibrium is destroyed; but it may be completely restored by filling the hollow cylinder, A, with

water. The amount of weight which B has lost by being placed in the water, is thus found to be exactly the same as the weight of a quantity of water equal to its own bulk, or which is the same thing, to the quantity of water displaced by it. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves, they swim on the surface, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own bulk, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same weight as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the water displaced by them weighs precisely the same as they do. The pretty scientific toy called the Cartesian Diver is intended to illustrate this. Although the principle of Archimedes is generally established with reference to water, its application extends equally to bodies immersed in air or any other fluid.

Archimedes' Screw (called also the *spiral pump*), a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Fig. 1 represents it in its simplest form. This consists

Fig. 1.

of a flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. In the position represented in the figure, the lowest bend, *a*, of the tube will be filled with water, and if now the handle be made to turn, as seen in the diagram, in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water inclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend, *b*. The first bend, *a*, has meanwhile received a second charge, which, after a second revolution, flows into the second bend, *b*, and takes the place of the first charge, which has now moved into the third bend, *c*. When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution, the lowest bend will be charged, and the highest discharged. It will be seen from the figure that there is room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines, the cylinder itself is

hollowed out into a double or triple-threaded screw, and inclosed in a water-tight case, which turns round with it, the space between the threads supplying the place of such tubes as are seen in fig. 1. Fig. 2 represents a double-threaded Archimedes screw of this description, with the case removed in front. It is sometimes found

Fig. 2.

convenient to fix the exterior envelope, and to make the screw work within it, the outer edge of the latter being as close as possible to the former without actual contact. This modification of the Archimedes screw receives the name of water-screw, and frequently of Dutch screw, from its being extensively used in Holland for draining low grounds.

Archipel'ago, an Italian form, dating from the 13th century, of the Gr. *Archipelagos*, 'the chief sea,' and the term applied originally to that part of the Mediterranean which separates Greece from Asia (the *Ægean Sea* of the ancients); but now extended to any sea, like it, thickly interspersed with islands, or rather to the group of islands themselves. All archipelagoes fall naturally into two groups, the oceanic and the continental. The latter either lie close to the mainland, or are so dotted about the sea as to join, like stepping-stones, two continents. Such are the Chiloe, Patagonian, Arctic, and other groups. The oceanic archipelagoes stand alone, and include the East and West India groups, the Marquesas, and the Sandwich and Friendly Islands. These, as well as Nova Zembla, Spitzbergen, Franz-Josef Land, and any others loosely called archipelagoes, will receive separate notice in their places. The islands in the Greek Archipelago consist principally of two groups, called Cyclades and Sporades; the first from their *encircling* the sacred island of Delos, the second from their being *scattered* in a wavy line. The former lie to the east of Southern Greece, while the latter skirt the west of Asia Minor. The numerous islands which stud this sea range in size from the merest barren rocks to Crete, with an area of 3326 sq. m. Most are of volcanic origin, with high bluffs rising abruptly from the sea. Many are very fertile, producing wheat, silk, cotton, wine, honey, figs, oranges, raisins, and other fruits. The people of the Sporades are employed in fishing for sponge and coral. The climate is healthy, the men are hardy, and the women noted for their beauty, of a pure Greek type. Of the Cyclades, all belonging to Greece, the principal are: Syra, Delos, Tenos, Andros, Cythnos, Thera, Naxos, Melos, and Paros. The chief islands of the Sporades are: Carpathos, Rhodes, Cos, Patmos, Icaria, Samos, Chios, Lesbos, Lemnos, Imbros, Samothrace, and Psyra. These all belong to Turkey, and constitute a separate vilayet of the empire, except Samos, which is autonomous, and tributary only; but the following, off Eubœa (Negropont), and many smaller islands, belong to Greece: Scyros, Icos, Scopelos, and

Sciathos. Of both groups, the more considerable islands will be noticed, under the alphabetical arrangement, in their respective places.

Architecture is the art of building or constructing. In this country, architecture is usually divided into Civil, Military, and Naval. In the present article we shall confine ourselves to the first, the two others being treated of, the former under the head of FORTIFICATION, the latter under that of SHIPBUILDING.

The construction of bridges, and especially stone bridges, piers, quays, &c., is just as much a department of architecture as of civil engineering, though in modern times the principle of division of labour has been introduced, and this department has been assigned to the engineer.

Civil Architecture has a scientific or constructive side, and an æsthetic or artistic side. The first relates to the strength, the safety, the convenience, and the comfort of a building, as well as to the nature of the materials used in its construction. The second relates not only to the forms and proportions of its principal features, but to its decorative character, produced by such details as columns, mouldings, tracery, carving, applied sculpture, and inlaying, which in all good architecture are founded on the constructive elements.

The constructive part of architecture, including masonry, carpentry, ironwork, and minor matters, is dealt with under BUILDING. Rude stone monuments are such as consist of separate stones or remains of very rude construction. Dolmens, cromlechs, stone circles, and the Scottish brochs are examples of these, and are treated under their several heads. Every nation which has risen above the condition of the savage has adopted some special mode of building suitable to its wants, its climate, and its customs. This is invariably accompanied with a certain style of decoration, arising from the peculiar genius and surroundings of each people. Such styles are usually very persistent in each race, and are handed down traditionally from age to age, and carried from one country to another. Thus the ancient monuments of a country generally serve as a sure index of the people who inhabited it at the time of their erection, just as the names of places preserve the language of their early occupants. Through commercial and other intercourse, the artistic traditions of one country came to be adopted in others, and received different developments in each, as nations rose and fell in the progress of civilisation.

The later and more refined architecture of a country is generally based on some primitive, simple idea. Thus, in the early and rude times of nearly all nations, it has been the practice to erect a large single stone, or to heap up a pile of stones, as a monument to commemorate some great event. In Egypt and elsewhere we see this primitive idea preserved and developed in the great pyramids and obelisks of a later and more cultivated age. Under the Romans, a similar tradition is exemplified in the sumptuous mausoleums and commemorative pillars of the empire.

In the construction and decoration of buildings, the same principles hold. However elaborate and diversified the edifices of different times and countries may be, all their styles may be traced back to the two chief building materials of wood and stone. Every principle of architecture may be shown to be founded on the forms naturally adopted for construction in one or other of these materials. Wooden construction manifests itself in upright pillars with beams laid across them, hence called the *trabeate* system, while genuine stone building is distinguished by the employment of the arch with its necessary abutments. Most of the nations of antiquity, notably Egypt and Greece,

although acquainted with the use of the arch, preferred not to employ it in their monuments, but to adhere to the earlier and simpler *trabeate* type of the pillar and beam; and the details of their architecture, although executed in stone, contain evidences of their wooden origin in the traditional wooden features of triglyphs, metopes, &c.

The arch was well known to the Egyptians and Assyrians, and was used by them in tunnels and drains, but it was never adopted as a leading feature in architecture till about the time of the Roman empire. Having once permitted this emblem of true stone architecture to take a prominent place in their edifices, it soon showed its power by completely revolutionising the whole system. The external architecture, which the Romans had borrowed from the Greeks, was gradually converted into an internal architecture resulting from the development of arch-construction. From this principle, first adopted by the Romans, the whole of the subsequent architecture of Byzantium and the middle ages was evolved.

We thus see that the essential principles common to all architecture were handed down from one country and from one state of civilisation to another. In the same way, the decorative features developed in one age and country had great influence on succeeding nations. Egyptian art influenced Assyrian both in general forms and details, and both lent their aid to the Greeks, although in the simple and refined art of the latter there is some difficulty in recognising the more elaborate forms and decorations of their prototypes. The influence of Greek art on Roman is very apparent in every feature, while that of the latter on Byzantine and Gothic architecture, although more subtle, is none the less powerful.

This article treats very briefly of the history of the various styles of architecture, of which more details are given under their separate headings.

Egyptian.—The history of architecture may be said to begin with the construction of the Egyptian Pyramids, 3000 years or more before the birth of Christ, but it is long after this—namely, 2570 B.C.—ere we find in Egypt a form of structure which contains the germ of a style practised at a later age in Greece. One or more of the tombs at Beni-Hassan are of the latter date, and have pillars which have so much in common with the style of those of the earliest Grecian temples, that they have been said to belong to a pre-Doric order. No doubt the great temples at Thebes, Karnac, and other places, built at a still later time than these tombs, more or less determined the general forms of buildings of a similar nature subsequently erected in Assyria.

Assyrian.—Assyria comes next to Egypt for the age and importance of its buildings. The remains of some of these, which are chiefly palaces, are of great splendour. Among the oldest hitherto excavated is the North-west Palace at Nimroud, built about 884 B.C. Their peculiar style of architecture is familiar to those who have read Mr Layard's work on his discoveries at Nineveh.

Persian.—Persia possesses in the remarkable ruins of palaces at Persepolis and Susa, built in the 5th and 6th centuries B.C., remains which bear a close resemblance to those of Assyria. The constructional parts of these Persian buildings being chiefly of marble, where those of the Assyrians were of wood, have been much better preserved. French explorers have discovered at Susa, a portion of an ancient palace built of bricks faced with enamelled colours. Fergusson pointed out that the Greeks got their first idea of the Ionic capital from buildings in Assyria and Persia. Indeed, he considered that the earliest form of the Corinthian capital could likewise be traced to these sources.

Indian.—Examples of almost every kind of construction, both in wood and stone, are to be found in the various styles of this wonderful country. Until recent years, it was believed that the cave-temples of India were of a very early date, but it has now been ascertained that none of these go further back than the 6th or 7th century of our era. All other ancient monuments in India, with the exception of the topes or pillars erected by the powerful ruler Asoka, are of still more recent date.

Greek.—Ancient Greek architecture is almost wholly represented by temples and theatres, the remains of which are found not only in Greece itself, but in Southern Italy, Asia Minor, and certain districts in North Africa. Some of these, as their ruins show—notably the temple of Diana at Ephesus—were originally of great size; and their architecture, even in its minutest details, is of a very refined character. The Grecian style embraces three orders, called the Doric, the Ionic, and the Corinthian. The most marked, though not the only distinguishing feature in these, is the capital of the column. The architecture of ancient Greece flourished from 650 to 324 B.C.

Roman.—The Romans borrowed their early architecture from that of Greece and Etruria, but about Roman buildings erected much before the Christian era very little is known. In Egypt, Assyria, Greece, and Etruria, architecture was chiefly confined to tombs, temples, palaces, or theatres. The Romans, however, applied it to many other purposes, such as basilicas, baths, bridges, aqueducts, triumphal arches, and domestic buildings. The circular and pointed arch, though known to earlier nations, seems to have been first used as a conspicuous feature by the Etruscans, whose buildings were chiefly tombs and city-walls and gates. From them the Romans borrowed the round arch, and put it to both a constructive and an ornamental use in almost all their buildings. They soon advanced a step further, and applied it as a vault in rectangular and circular edifices. By the Romans, the Grecian orders were modified in their proportions and details, and two others were added—namely, the Tuscan (a variety of the Roman Doric) and the Composite. In many of their buildings, such as the Colosseum, built 80 A.D. (see AMPHITHEATRE), the orders are piled over each other, dividing the great height of the external wall into several tiers or stories. Besides the Colosseum, the Pantheon, the Theatre of Marcellus, and the remains of temples, baths with their great vaulted halls, triumphal arches, and other monuments, still survive as examples of ancient architecture in Rome itself, built between the time of Augustus in the last century B.C., and that of Constantine in the 4th century A.D. At Pompeii, there are interesting examples of the domestic architecture of the 1st century of our era. Many important ancient Roman remains are likewise found not only in Italy, but in other countries subject to the empire in Europe, Asia, and Africa.

Byzantine.—With the establishment of Byzantium as the capital of the empire, the Roman style of architecture was naturally much practised there, and in particular the development of the dome became from the first a chief object with the eastern architects. Christians were first allowed to erect places of worship in the reign of Constantine the Great. The old basilicas, or courts of justice, were then turned into churches, for which they were well suited. Professor Baldwin Brown, of Edinburgh, has attempted to prove that the humbler *schola*, or hall of meeting, such as was used by the early Christians, as well as by heathen clubs and associations, rather than the basilica, was the original form of the Christian church. The name Byzantine is, strictly speaking, only

applicable to the Christian architecture of Eastern Europe and Asia Minor, erected from the reign of Justinian to the 11th century; but the style continued in use, in a less pure form, till the Mohammedans subdued the Christian countries of the East. One of the finest buildings in this style is the church of St Sophia at Constantinople, founded by Constantine, but rebuilt by Justinian in 547 A.D. The cathedral of San Vitale at Ravenna, also erected in the 6th century, and St Mark's at Venice, built by architects from Constantinople in the 10th century, are two of the most perfect and interesting Byzantine churches in Italy.

Romanesque is the general term applied to all the various round-arched styles which arose in Western Europe, after the irruptions of the barbarians had ceased. It was founded partly on the Roman remains existing in different countries, and also, to a large extent, on the influence of the still flourishing Byzantine art on the awakening communities of the West.—*Teutonic Romanesque* may be regarded as synonymous with Rhenish architecture. The cathedrals of Spire, Mayence, and Worms are examples.—*Lombard Architecture*, the form of Romanesque practised in Lombardy. Examples of it are to be seen in St Ambrogio at Milan, St Abondio at Como, and the cathedrals of Parma and Piacenza. The Romanesque styles of Lombardy and countries north of the Alps, including the Norman of France and England, prevailed during the 11th and 12th centuries.

Saxon or Pre-Norman.—The Norman style would link on more naturally than this with the Teutonic Romanesque. But the Saxon is prior in point of date, and is the earliest of our native styles. It is simple, and has, as a rule, coarsely dressed masonry. The 'long and short work' of the corners and other parts are very probably imitations of woodwork. In whole or in part, the churches of Bradford (Wilts), Earl's Barton, Worth, Monkwearmouth, and other places in England; and perhaps that of St Regulus at St Andrews, in Scotland, are pre-Norman. But there are some curious problems still to solve about these buildings erected prior to the Norman Conquest.

Norman.—This style is also sometimes called Romanesque. No kind of architecture is better known in England and Scotland than the Norman, owing to the abundance of examples which remain. It is characterised by round-headed openings, by flat buttresses like pilasters, by 'cubical' masonry, and by the richness and quaintness of the carving, especially on many of the doorways and chancel arches of even the smaller churches. In the cathedrals and large churches the pillars dividing the aisles from the nave are very massive. Among the many examples in England may be mentioned the cathedrals of Durham, Canterbury, Peterborough, and parts of Lincoln and Winchester. In Scotland, Kirkwall Cathedral is the most complete example on a large scale; but the abbeys of Dunfermline, Kelso, and Jedburgh are also fine, though fragmentary. The small churches of Dalmeny and Leuchars have rich carving.

Under the general term *Gothic Architecture* (q.v.) some writers include the Norman style. More usually, however, the name Gothic is understood to mean the pointed styles of architecture, which succeeded the Romanesque and Norman.

Early English or First Pointed Style.—As soon as the transition from the Norman to first pointed architecture was complete, the latter was characterised by its narrow pointed or 'lancet' windows, without any, or with only very simple, tracery. Further distinguishing features are high gables and roofs, and simple pinnacles and spires. Buttresses are deep instead of shallow, as in the Norman,

and shafts slender, whether they are simple or clustered. The capital is bell-shaped, either with plain mouldings or with bold and graceful foliage, and the Abacus (q.v.) in this country is round instead of square. The mouldings consist of projecting rounds and deep retiring hollows, which give strong light and shade. In England, Salisbury Cathedral is wholly in this style, so also are the nave and transepts of Westminster Abbey. Scotland has good examples of it in the choir of Glasgow, and in most of what remains of Elgin Cathedral. This style lasted from towards the end of the 12th to near the end of the 13th century.

Transition.—At the former date a change is observable in the window-tracery, the foliage, &c., indicating that the style is gradually altering or undergoing a transition to the

Decorated, Second Pointed, or Middle Pointed Style.—Windows are now divided into a number of lights by comparatively thin mullions, and their upper portions filled with beautiful tracery, which at first was of geometrical forms, such as combinations of circles, trefoils, and quatrefoils. But in the later period of the style, the tracery becomes wavy and flowing, and of almost endless variety. Ordinary buttresses are more enriched than in the earlier style, and flying-buttresses, though not for the first time used, are now common. A continuation of the arch-mouldings, instead of shafts with caps, at length characterises the jambs of the doorways. All the smaller ornaments and foliage are rich, free, and graceful. This is generally considered the most perfect and beautiful style of Gothic architecture. As examples of it, may be mentioned the choir of Lincoln and the nave of York Cathedral; and in Scotland portions of Melrose Abbey. The style continued from about 1274 to 1377. It then gradually stiffened into what is called the

Perpendicular, Third Pointed, or Late Pointed Style.—This is easily distinguished from the previous style by the tracery of the windows, which is characterised by an upright and square tendency. Perpendicular lines prevail in the windows as well as in the ornamental paneling. The doorways have square heads over pointed arches. Gables and roofs are at a low angle. Clerestory windows are more frequently square-headed than arched. It is only in this style that we find the depressed four-centred or Tudor arch, although arches with two centres are also used. Rich fan-tracery (q.v.) appears in the vaulting, and ornamental open timber roofs are frequent (see ROOF). The perpendicular style is not represented in continental Gothic buildings. Westminster Hall, London, is an early example of this style. Henry VII.'s Chapel, Westminster Abbey, has beautiful fan-tracery. Somersetshire is peculiarly rich in churches of this period. In Scotland, the great east window of Melrose Abbey is a good example. The style prevailed from the end of the 14th to the middle of the 16th century. The later portion of this period is sometimes called the *Tudor* style. The elaborately ornamented *Flamboyant* (q.v.) style was the latest style of Gothic in France (15th and 16th centuries). The Municipal Architecture (q.v.) of the middle ages was largely Gothic in type.

Under the head GOTHIC ARCHITECTURE will be found some account of buildings belonging to the different periods of pointed architecture on the Continent.

Roman or classic architecture may be said to have never entirely died out in Rome, and when, in the 15th century, the revival of classic literature and taste took place, the ancient classic style of architecture naturally revived along with them. This is called the *Italian Renaissance*. Buildings,

many of which are famous, erected at Rome, Florence, Venice, and other places in Italy, from the beginning of the 15th to the end of the 17th century, and some would say even later, are included under the general term Italian architecture. The name Renaissance is likewise given to it, but this term is also applied to architectural works erected in other parts of Europe after the decay of Gothic architecture in the 16th century; and in a wide sense it includes all edifices built in a classical (but not when of a purely Greek) style from that time to our own. It comprises so many diversities that it is hardly possible to define it with any kind of precision. Renaissance as applied to architecture means a revival of classical features and details as distinguished from those which characterise the Gothic. St Peter's at Rome; the Pitti Palace at Florence; various palaces on the grand canal at Venice; the Louvre and Tuilleries at Paris; the Banqueting House in Whitehall, and St Paul's Cathedral, London, are all examples of Renaissance.

Elizabethan Architecture (q.v.), and the corresponding style on the Continent, is a variety of Renaissance, in which Gothic and Italian features are somewhat mixed. Holland House, near London, as well as Hatfield House, Burleigh House, and Hardwick Hall, in other parts of England, are well-known buildings in this style; so also is Heriot's Hospital at Edinburgh.

Arabian, Saracenic, or Moorish.—This singular and beautiful style of architecture appears to have first taken a definite character in the 9th century, and was probably based on Persian, together with some of the elements of Roman and Byzantine art. The style is noted for its elegant domes, often with remarkable external decoration; for its graceful minarets or towers, lessening in diameter stage by stage as they rise; for the frequent use of the pointed arch, and of the horseshoe arch; and in some cases for the peculiarly slender columns which support the walls above them. The flat or surface decorations are peculiarly striking and effective. These consist of diaper-work, often richly perforated; and of scroll-work of great variety, often of fairy-like lightness. The stalactitic-looking pendentives, filling up such places as the corners of ceilings, have a remarkably fine effect. Several mosques and other buildings at Cairo, a peculiar class of houses in Algiers, and the Moorish palace of the Alhambra, as well as the mosque of Cordova, in Spain, furnish striking illustrations of this kind of architecture.

Modern Architecture.—This title is generally applied to the architecture which has been used by European nations since the time of the Renaissance. The Renaissance, as we have seen, was a revival of Roman architecture, the study of which naturally led to an acquaintance with its prototype, the architecture of Greece. The examination of Grecian buildings, and the revival of their style, was much encouraged in the 18th century. In the beginning of the 19th century, the habit of imitating ancient styles had been established, and began to be applied to Gothic architecture also, which speedily came to be generally adopted, especially for ecclesiastical edifices. This has been particularly the case in Great Britain, and amongst the Anglo-Saxon race wherever found—in America, India, and Australia, as well as at home. All modern architecture is imitative, and it is doubtful whether a really new style is possible. At present Gothic is generally adopted for churches, and Renaissance for domestic buildings. The Houses of Parliament at Westminster are one great example of an attempt to apply Gothic to a secular building, and the Law Courts recently erected in London are another. In France, the birthplace

of Gothic, it is little practised, the French having adopted a special modification of the Renaissance, which is known as the 'French style.' Most of the great modern towns, such as Paris, Lyons, and Marseilles, have been largely rebuilt in this style. In Germany and Italy the purer classic examples have been more frequently followed; but in recent years there has been a strong tendency both in Germany and this country to follow the style of the Renaissance as practised in each country during the 16th and 17th centuries. The architecture of America follows very much the same course as that of Europe. See Fergusson's *Handbook of Architecture*; Ruskin's *Seven Lamps of Architecture*; the works of Pugin, Viollet le Duc, Parker, Freeman; and works on special departments of architecture noted under the several articles therein.

The domestic architecture of each style will, when practicable, be treated under the different headings. Each of the principal styles of architecture, briefly characterised above, receives separate treatment at its own alphabetical place in this work. Amongst numerous other articles on architectural subjects are:

Aisle.	Column.	Gargoyles.
Alhambra.	Cornice.	Lancet-window.
Apse.	Crochets.	Mullion.
Aqueduct.	Cusp.	Pillar.
Arch.	Cyclopean.	Piscina.
Architrave.	Diaper.	Porch.
Baptistery.	Domestic Architecture.	Quatrefoil.
Basilica.	Door.	Restoration.
Buttress.	Ellora.	Round Towers.
Canopy.	Entablature.	Spire.
Castle.	Fan-tracery.	Tooth-ornament.
Church.	Finial.	Tracery.
Cinquefoil.	Flamboyant.	Window.
Cloister.		

Architrave (Gr. *archi-*, 'chief;' Lat. *trabs*, 'beam'), the lowest part of the Entablature (q.v.), or that which rests immediately upon the columns. See COLUMN.

Archives. See RECORDS.

Archivolt, the ornamental band or moulding which runs round the lower part of the voussoirs of an arch.

Archon, the highest magistrate in Athens. The government was originally monarchical; but on the death of Codrus (q.v.), the Athenians, according to the traditionary account, resolved that no one should succeed him with the title of king (*basileus*), and therefore appointed his son Medon with the title of *archon* (ruler). The office was at first for life, and confined to the family of Medon; but in 752 B.C. the time of office was limited to ten years; and in 714 the exclusive claims of Medon's family to the office were abrogated, and it was thrown open to all persons of noble birth, afterwards by Aristides to all citizens without distinction of rank (477 B.C.). In 683 the office had been made annual, and the number of archons had been extended to nine. The first archon was styled *Eponymos*, and from him the year was named; to the second, styled *Basileus*, belonged the care of religious affairs; the third was *Polemarchos*, or commander-in-chief; and the remaining six, having to conduct all criminal trials, were styled *Thesmothetæ*, or lawgivers.

Archpriest. Archpriest was the title given to the superiors who were appointed by the pope to govern the secular priests sent into England from the foreign seminaries during the period 1598-1621. On the death of Cardinal Allen, in 1594, the missionary priests were left without a head. Dissensions had already sprung up between the secular clergy and the Jesuits. The need of some superior was evident. Some wished for the ordinary government of bishops. The Jesuits desired to keep the control of affairs in their own hands.

Through the influence of Father Parsons, Clement VIII. commissioned Cardinal Cajetan, called the Protector of England, to appoint George Blackwell archpriest, with jurisdiction over the secular clergy of both England and Scotland (March 1598). The archpriest was to have twelve assistants, but among other instructions given to him was an order that in all matters of importance he should consult the superior of the Jesuits in England, at that time Father Garnet. It is said that Parsons's object in thus placing the direction of British Catholics in the hands of one man subservient to the Jesuits, was the better to further the political projects of his own or the Spanish party in view of the succession to the crown. The leading secular clergy protested against the novel appointment as irregular in its institution, made upon false and fraudulent information, and oppressive in its action. They finally (November 1600) drew up a formal appeal, signed by thirty-three priests, and, secretly aided by the queen and council, sent four of their number to represent their cause at Rome. Some of the grievances complained of were at length redressed, and the archpriest's abuse of power and the influence of the Jesuits controlled, but the form of government was retained. Blackwell was deprived in 1608 for taking, and persuading others to take, the oath of allegiance, which had been condemned by Urban V. He died in a London prison five years afterwards.

George Birket or Birkhead, who was appointed in Blackwell's place in 1608, died in 1614. The third and last archpriest was Dr William Harrison, who ruled the clergy in this capacity till his death in 1621. Harrison had himself urged upon Rome the appointment of bishops, while the Jesuits in their turn now sought the aid of the government in opposing it. In 1623 William Bishop, the chief antagonist of Blackwell, and a leader of the appellants, was made titular Bishop of Chalcedon, and vicar-apostolic of England and Scotland.

Archytas OF TARENTUM, one of the most illustrious men of antiquity, flourished about 400 B.C., and was accordingly a contemporary of Plato. His public career was glorious. He was seven times elected general of his city, and was victorious in every campaign. His civil administration was equally fortunate; and he was no less distinguished as a mathematician and philosopher. His virtues were as conspicuous as his talents; he was unselfish, moderate, and humane; and although one of the greatest geometers, he did not disdain to make toys for his children. He solved the problem of the doubling of the cubes, and secured almost the reputation of a magician by his numerous mechanical contrivances, the most wonderful of which was the flying pigeon. A Pythagorean in philosophy, he is supposed to have exerted an influence on Plato, and some affirm that Aristotle was indebted to him for the idea of his categories. Only unimportant fragments of his writings remain. They relate to metaphysics, ethics, logic, and physics. Horace says he was drowned in the Adriatic.

Arcis-sur-Aube, a town of 3000 inhabitants in the French department of Aube, on the navigable Aube, 22 miles N. of Troyes by rail. It was the birthplace of Danton, and near it a battle was fought, March 20-21, 1814, between Napoleon and the allied forces under Prince Schwarzenberg, ending in a French retreat.

Arcole, a village on the left bank of the Adige, in Northern Italy, 15 miles ESE. of Verona, famous for the victory gained by Napoleon over the Austrians, 15th to 17th November 1796.

Arcos de la Frontera, a town on the right bank of the Guadalete, in the Spanish province

of Cadiz, 20 miles ENE. of Xeres. It has a romantic situation, on a rocky hill, and was called *de la Frontera*, from its having stood on the frontiers of the old Moorish kingdom of Granada. Almost impregnable by nature, it was furthermore embattled with walls and towers, part of which still remain. It manufactures leather, hats, and articles made of esparto grass; and produces wine, oil, and fruit. Pop. (1878) 16,280.

Arcot (*Aru-Kadu*, 'six deserts'), a city of British India, in the presidency of Madras, the capital of the district of North Arcot. It is situated on the right bank of the Palar, 5 miles from Arcot railway station, and 65 WSW. of Madras. Besides the military cantonment, which can accommodate three regiments of cavalry, Arcot contains some mosques in a tolerable state of repair, and the ruins of the Nawab's palace. In 1751 Clive, with 300 Sepoys and 200 Europeans, marched against Arcot, which was garrisoned by 1100 men; and after having taken it, had in his turn to withstand a siege of fifty days. Arcot was afterwards captured by the French, but retaken by Colonel Coote in 1760. It was taken and held for a time by Hyder Ali, but passed into the hands of the British in 1801. Pop. (1871) 10,988; (1881) 12,000.

The districts of NORTH and SOUTH ARCOT form a portion of the presidency of Madras. They are dependent on tanks in the dry season, and have suffered severely from famines. Area of North Arcot, 7139 sq. m.; pop. (1881) 1,817,561; area of South Arcot, 4873 sq. m.; pop. (1881) 1,815,151.

Arctic means, properly, lying near the constellation of the Bear (Gr. *arctos*) or Ursa Major (q.v.), and hence, northern. The Arctic Circle is a circle drawn round the North Pole, at a distance from it equal to the obliquity of the ecliptic, or $23\frac{1}{2}^{\circ}$. The corresponding circle round the South Pole is the Antarctic Circle. Within each of these circles there is a period of the year when the sun does not set, and another when he is never seen, this latter period being longer the nearer to the pole. The word is also used figuratively to express extreme cold.

Arctic Animals. The region north of the cultivation of cereals is peopled by a limited and homogeneous fauna. Mammals are represented almost exclusively by ruminants, carnivores, and rodents, such as the Arctic fox, polar bear, glutton, ermine, sable, walrus, tail-less hare, lemming, reindeer, and musk-ox. Birds are represented especially by the snow-partridges, snowy owl, Iceland falcon, eider-duck, auks, divers, and guillemots. No reptiles can live in the cold of the arctic regions; but fishes, especially Salmonidae, are well represented. Insects and molluscs are fairly numerous. Not a few of the birds and mammals inhabiting these snowy regions exhibit adaptive characters of white colour, thick coats, accumulations of fat, and the like. See GEOGRAPHICAL DISTRIBUTION; Pennant's *Arctic Zoology*; and Heilprin's *Distribution of Animals* (Internat. Sc. Series, 1887).

Arctic Ocean. The Arctic Ocean lies to the north of Europe, Asia, and North America, and surrounds the North Pole; it is usually defined as the water area within the Arctic Circle. The influence of the Gulf Stream, however, carries a relatively mild climate a long way within the Arctic Circle off the coasts of Norway; and, on the other hand, the Arctic currents along the east coast of Greenland, and through Davis Strait, bring down Arctic conditions a long distance into the Atlantic. Physiographically, the Norwegian Sea and Greenland Sea, situated between Norway and Greenland, belong to the same basin as the Arctic Ocean, it being cut off from the Atlantic by the

ridges stretching between Greenland, Iceland, the Farø Islands, and the north of Scotland, which have an average depth over them of 240 fathoms. If the Arctic Ocean be regarded as lying wholly within the Arctic Circle, then it is almost land-locked between that circle and the parallel of 70° N. It communicates with the Pacific by Behring Strait, and with the Atlantic through Davis Strait and the wide sea between Norway and Greenland. The area of the ocean is about 5,500,000 sq. m., and into it there drain about 8,600,000 sq. m. of land. The rainfall on this land is estimated at 2100 cubic miles per annum. The coasts of Europe and Asia are low, and have several deep indentations, the principal being the White Sea and Gulf of Obi. The shores of North America are skirted by a most irregular assemblage of islands, forming numerous gulfs, bays, and channels. The principal islands of the Arctic Ocean are Greenland, Spitzbergen, Franz-Josef Land, Nova Zembla, New Siberia, Wrangel Island, Prince Patrick Island, Melville Island, Banks Land, Ellesmere Land, Grinnell Land, &c. The principal rivers from Asia are the Lena, Yenesei, and Obi; from Europe, the Onega, Dwina, and Petchora; from America, the Mackenzie. The Arctic highlands are covered with an enormous depth of snow and ice. In some places this results in the formation of great glaciers, one of the most remarkable of which is the Humboldt Glacier, in 79° N. lat., on the west coast of Greenland. There are, however, no large, flat-topped tabular icebergs, like those of the southern hemisphere, within the Arctic Ocean; and this of itself is good evidence that there is no expanse of land towards the North Pole. The whole ocean is covered by immense ice-fields from 5 to 50 feet in thickness. During winter these are bound together by the severe frost, but these continuous masses break up during the summer months into floes and floe-bergs. Sometimes vast spaces of water and long lanes are formed between the floes and ice-fields, and these have, doubtless, given rise to the notions regarding an open Polar Sea which at one time prevailed. When these great floating ice-fields come together, the margins where they collide are piled up on each other, and thus is produced the well-known hummocky ice-floes. When this hummocky ice is jammed against a shallow shore, and becomes fixed for long periods of time, the appearances are produced to which Nares gave the name of 'Palæocrystic Sea.' In the more open parts of the ocean the ice is, however, always in motion. Immense quantities of field and hummocky ice pass down each year between Spitzbergen and Greenland, and Greenland and Iceland, these waters being almost always blocked. Frozen in this ice, whole pine-trees are not uncommonly found; these have most probably been carried right across the pole, after having been carried into the Arctic Ocean by the rivers of the Old and New World. Large fresh-water ponds and lakes are formed on the ice-fields during summer by the rain and melting snow. When these are frozen again, a 'black ice' is formed, which contrasts strongly with the 'white ice' formed from salt water. The whalers supply themselves with water by picking up the 'black ice.' Parry found, as he travelled over the ice north of Spitzbergen, that it was moving in a body to the south. He reached a latitude of $82^{\circ} 45'$, Markham reached $83^{\circ} 20'$, and Lockwood (of Greely's expedition, 1882) $83^{\circ} 24'$, the most northerly point yet attained. In 1850 M'Clure entered Behring Strait, and brought his crew home by Davis Strait, thus discovering the *North-west Passage*. In 1878 and 1879 Nordenskiöld sailed from the Atlantic to the Pacific along the northern shores of Europe and Asia, thus discovering the *North-east Passage*.

Throughout the whole of the Arctic basin, ice-cold water is found from surface to bottom, except off the Norwegian shores, where it is met with at depths varying from 400 to 600 fathoms beneath the surface. This cold Arctic water penetrates the Farøe Channel at the bottom, as far as the north of Scotland, where it is stopped by the Wyville-Thomson Ridge running between the Farøe banks and the north of Scotland; on the north of this ridge there is, at a depth of 400 and 500 fathoms, a temperature of 30° F.; while on the south side, at the same depths, the temperature is 45° F. The width of this ridge is about 10 miles, and on it there is a depth of 250 fathoms. The warm Gulf Stream water flows over this ridge and on to the coasts of Norway, rendering its northern shores and those of Lapland relatively mild and habitable, the July temperature off the North Cape being 47° F. Musk-oxen, reindeer, foxes, hares, and wolves are met with on Arctic land. Polar bears roam widely over the ice-fields. Whales, walruses, narwhals, and seals abound. Guillemots, little auks, gulls, and other sea-birds are found in vast numbers near Spitzbergen and other islands. Eider-ducks nest on the low lands, and their down is collected as an article of commerce. There are valuable seal, whale, walrus, and shark fisheries; and cod, mackerel, herring, and lobsters are also captured. There is a great amount of invertebrate life at the surface of the sea, and diatoms are also abundant. The Norwegian expeditions show that life exists at great depths, but it is by no means so abundant as in the Antarctic. The ocean appears to be shallow to the north of Europe and Asia, the depth 500 miles to the north of the Lena being only 38 fathoms; and Markham found only 72 fathoms at his most northerly point off the American coast. Between Spitzbergen and Lapland the depths are from 100 to 200 fathoms; but between Spitzbergen and the north of Greenland there is a deep opening into the frozen sea, where the depth is 2500 fathoms. Between Norway and Iceland and Greenland the depths are sometimes over 2000 fathoms, and generally over 1000 fathoms in the central parts. The depths in Behring Strait are less than 100 fathoms. The deposits in the Arctic Ocean are blue muds, composed almost wholly of land debris. In the south-east portions of the Norwegian Sea, some of the deposits approach in character to a globigerina ooze. South-westerly winds prevail along the coasts of Norway, and as far as Franz-Josef Land; to the westward of this line, north-easterly winds prevail. In winter, winds blow from Northern Asia to the Arctic Ocean; in summer, from the ocean to the land. The direction of the winds over the Arctic Ocean at different seasons is controlled by the positions of the barometric maxima and minima in the north parts of Asia and the North Atlantic. Fogs and mists are of most frequent occurrence during the six months of day and summer. In winter the temperature of the air is sometimes as low as - 47° F., and in summer is usually a little above the freezing-point. There is a large export trade in fossil ivory from the New Siberia (Liakhoff) Islands. This consists of the tusks of the mammoth, whose remains are abundant in Northern Russia. For an account of Arctic expeditions, see POLAR EXPLORATION.

Arctium. See BURDOCK.

Arctomys. See MARMOT.

Ar'cus Sen'lis (Lat., 'the bow of old age'), a narrow white or yellowish band close to, but within the margin of the cornea (see EYE), caused by fatty degeneration of its tissue. It usually begins during middle life, first at the upper, then at the lower part of the cornea; before old age is reached, these two arcs have generally united at

the sides to form a ring. It is frequently associated with Atheroma (see ARTERIES, *Diseases of*), but it is of no other practical importance.

Ard, or **AIRD,** a Celtic root, meaning 'height' (cf. Lat. *arduus*, 'high'), which appears in many geographical names, especially in Ireland and Scotland.

Ardahan, a village of about 300 houses in the portion of Turkish Armenia ceded in 1878 to Russia, 35 miles NW. of Kars. Its position gives it strategic importance. Its fortress was dismantled by the Russians in the war of 1854-56; in 1878 the Berlin Congress sanctioned the cession to Russia of Ardahan, which had been captured early in the war. On account of the severity of the climate, the houses of Ardahan are mainly constructed underground.

Ardalan, a province in the west of Persia, embracing the basin of the Shirwan Rdd. It is generally mountainous, but the valleys are very fertile, and if well watered, yield cereals and fruits in abundance. Area, 6000 sq. m.; estimated pop. 150,000. Capital, Kermanshah (q.v.).

Ardea. See HERON.

Ardebil, a town of Persia, in the province of Azerbaijan, 110 miles E. of Tabriz, and some 5000 feet above the sea. Pop. about 10,000.

Ardèche, a department in the south of France, takes its name from a tributary of the Rhone, and includes part of ancient Languedoc. It is almost wholly mountainous. In the NW. of the department, the Cevennes culminate in the volcanic Mont-Mezène, 5752 feet in height. Numerous extinct volcanic peaks, deep craters, grottos, rock-labyrinths, and basaltic columns, give an extraordinarily picturesque appearance to the scenery. The upland, where winter reigns for six or eight months, is devoted to pasturage; but the valley of the Rhone produces wine, olives, chestnuts, figs, and almonds. Only a fourth of the area is cultivated. Iron, coal, antimony, lead, marble, and gypsum are wrought. There are manufactures of silk, paper, leather, cloth, and straw. Area, 2136 sq. m.; pop. (1886) 375,472. The capital is Privas.

Ardee, a town in the west of County Louth, Ireland, on the river Dee, 12 miles inland. The ancient castle, built about the year 1200, is now used as the town-house; there is a handsome convent here. Pop. 3000.

Ardennes, an extensive hill-country and forest, occupying the SE. corner of Belgium, between the Moselle and the Meuse, but extending also into France and Rhenish Prussia. It consists of a broken mass of hills, for the most part of no great elevation, which gradually slope towards the plains of Flanders. The average height of the hills is less than 1600 feet; but in the east, they attain an elevation of about 2100 feet. Large tracts of this region consist not of hills, but of gently undulating plateaus, in some districts densely covered with oak and beech forests, but for the most part heathy, marshy, and barren. The channel of the Meuse is in some places bound in by rugged and precipitous cliffs more than 600 feet high. The principal rocks of the Ardennes are clay-slate, graywacke, quartz rock, and various metamorphic rocks; besides which occur in various places extensive outcrops of crystalline limestone. The wealth of the region is its wood and its minerals. Enormous supplies of coal are found in the north, a very important element in Belgium's industrial wealth; iron, lead, antimony, copper, and manganese are also found. Multitudes of cattle and sheep are reared. The *Arduenna Silva* of the Romans extended over a still wider area. See Montagnac, *Les Ardennes* (2 vols. Par. 1875);

Lindley, *Walks in the Ardennes* (1887).—Shakespeare's Forest of Arden is a district in Warwickshire, extending from the Avon to near Birmingham.

Ardennes, a frontier department of France, bordering on Belgium. It is named from the forest of Ardennes, and formed a part of the old province of Champagne. Length from north to south, 63 miles; area, 2020 sq. m. The NE. belongs to the basin of the Meuse; the SW. is watered by the Aisne; these rivers being united by a canal. About two-fifths of the whole surface is hilly, and covered with forests and wide tracts of pasturage. In the north, marble is obtained; but the prevailing rock is limestone. South of this, and stretching across the department from east to west, are great layers of slate. Only the valleys are fertile, and produce corn. The vine is cultivated in the SW. Cattle and sheep are reared. Slate, marble, iron, clay, copper, and coal are found. Iron-working is largely carried on; but the chief industry is cloth-making, especially in Sedan. There are also manufactures of clay-pipes, glass, paper, sugar, and beer. The capital is Mézières, but the most important place is the great fortified city of Sedan. Pop. of department (1886), 332,759.

Arditi, LUIGI, musician and composer, born 22d July 1822, in Piedmont, studied music at the Conservatoire of Milan. Famous first as a violinist, then as a conductor, he came to London in 1857, and from that year till 1878 was musical director at Her Majesty's Theatre. He has conducted Italian opera and concerts in places as remote from one another as New York and Constantinople; has published the operas *I Briganti* (1841) and *La Spia* (1856); and is known as author of much popular music—songs, violin duets, and waltzes such as *Il Bacio*.

Ardnamur'chan Point, a rugged headland of Argyllshire, the most westerly point of the mainland of Britain. A castle-like lighthouse was built here in 1849.

Ar'doch, a place in Perthshire, 12 miles NNE. of Stirling, celebrated for a Roman camp, the most entire in Britain. The intrenched works form a rectangle 500 by 430 feet, the four sides facing the cardinal points. The north and east sides are protected by five deep ditches and six ramparts, these works being 270 feet broad on the north side, and 180 feet on the east. A deep morass exists on the SE., and the perpendicular banks of Knaik Water, rising 50 feet high, protect the camp on the west. The prætorium, or general's quarters, now called Chapel Hill, rises above the level of the camp, but is not exactly in the centre, and is nearly a square of 60 feet each side. Three of the four gates usual in Roman camps are still seen. A subterranean passage is said to have formerly extended from the prætorium under the bed of the Knaik. Not far north of this station, on the way to Crieff, may be traced three temporary Roman camps of different sizes. Portions of the ramparts of these camps still exist.

Ardoye, a town of Belgium, in the province of West Flanders, 17 miles S. of Bruges. It has extensive cloth-weaving works. Pop. (1882) 6082.

Ardros'san, a seaport and watering-place in Ayrshire, 1 mile WNW. of Saltcoats, and 32 miles SW. of Glasgow by rail. It owes its rise to Hugh, Earl of Eglinton, who began the formation of the present town and harbour in 1806, and who planned magnificent works, and spent vast sums in striving to make this the port of Glasgow. Suspended in 1815, these works were resumed in 1833, and now the harbour, which is sheltered by an islet, is one

of the safest and most accessible on the west coast of Scotland. A new dock was begun in 1887. The chief exports are coal and pig-iron; the chief imports, timber, grain, limestone, and iron-ore. On a hill above the town stands a fragment of Ardrossan Castle, said to have been surprised by Wallace, who slew its English garrison, and threw the dead bodies into a dungeon called 'Wallace's Larder.' Pop. (1881) 4036.

Are (Lat. *area*), the unit of the French land-measure, is a square, the side of which is 10 metres (or 32·809 feet) long (see METRE), and which therefore contains 100 square metres = 119·6 English square yards. The next denomination in the ascending scale is the *decare*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares, = 2·47 English statute or imperial acres.

Area (Lat.) is a term in mathematics meaning *quantity of surface*. The calculation of areas, or mensuration of surfaces, is one of the objects of geometry. The measuring unit is a square inch, a square foot, &c. according to the unit of length. As a figure is thus measured by finding an equivalent for its surface in *squares*, the process is sometimes called the *quadrature* of the figure. See QUADRATURE, MENSURATION, SURVEYING.

Are'ca, a genus of palm, containing several species, having pinnate leaves and double spathes. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *A. catechu*, the Penang Palm, or Betel-nut Palm, is a native of the East Indies, whose nut yields a sort of Catechu (q.v.). This Areca-nut, or Betel-nut, is very much used in many parts of the East, the chewing of it with quicklime and the leaf of the betel-pepper being one of the most prevalent habits of the people (see BETEL). The nut is about the size of a hen's egg; the fibrous husk about half an inch thick. It is austere and astringent. It is doubtful if it possesses a narcotic power, or if this is to be ascribed entirely to the leaf which is used along with it. Areca-nuts form a considerable article of trade in the East, and are to some extent imported as a source of tooth-powder. The timber of the palm which produces them, and its leaf-stalks and spathes, are also used for domestic purposes. The tree is often 40 or 50 feet high, and in general less than a foot in diameter. The leaves are few, but very large, their leaflets more than a yard long. In Malabar, an inebriating lozenge is prepared from the sap.—*A. oleracea*, the Cabbage Palm of the West Indies, is a very tall tree, 100 to 200 feet, whose huge terminal leaf-bud is sweet and nutritious, and is sometimes used for the table as cabbage, but when it is cut off, the tree is destroyed. The stem of this tree, notwithstanding its great height, is remarkably slender.—*A. sapida*, the New Zealand Palm, is remarkable as extending southward beyond the geographical limits of any other of its order, as far indeed as 38° 22' S. lat. It is a small palm, only from 6 to 10 feet high, with leaves 4 to 6 feet long. The young inflorescence is eaten.

Arecibo, a town on the north coast of the Spanish West Indian island of Porto Rico, 45 miles W. of San Juan. Pop. 10,000.

Are'na, a part of an amphitheatre where the combats of gladiators and wild beasts took place. It was so called because it was usually strewn with sand (Lat. *arena*).

Arena'ceous Rocks. All rocks composed entirely, or to a large extent, of grains of quartz are included under this title. Beds of loose sand occur extensively in the more recent deposits. The grains, either of quartz or flint, are generally

water-worn and rounded; in some cases, however, they are more or less angular, or rounded and angular grains occur commingled. In older deposits, the grains of sand are bound together by siliceous, calcareous, argillaceous, or ferruginous cements. It is seldom that a rock is composed of quartzose materials alone; grains or particles of other mineral substances are frequently mingled with the grains of quartz. Silvery flakes of mica are seldom absent; and they often occur in layers parallel to the planes of stratification, causing the rock to split into thin slabs, and exposing a glittering surface. These are called *micaceous sandstones*. When grains of felspar occur, it is a *felspathic sandstone*. Often large quantities of calcareous matter, either as cement or as distinct grains, occur; and these are called *calcareous sandstones*. In like manner we have *siliceous* and *ferruginous sandstones*, when silica and oxide of iron are conspicuously present as cementing or binding materials. Clay and carbonaceous matter, when plentifully diffused through the rock, give rise to *argillaceous*, *carbonaceous*, and *bituminous sandstones*. *Greensand*, or *glauconitic sandstone*, is a rock containing abundant grains of the dirty greenish mineral called glauconite. *Arkose* is a sandstone composed of disintegrated granite; *volcanic sandstone*, *trappean sandstone*, &c. being composed of disintegrated igneous rocks. The presence of lime can always be detected by the effervescence which takes place on the application of hydrochloric or other acid. A sandstone of homogeneous composition, which may be worked freely in any direction, is called *freestone* or *liver-rock*. *Flagstone* is a sandstone which is capable of being split into thin beds or flags along the planes of deposition. When the sandstone is coarse-grained, it is usually called *grit*. If it contain, more or less abundantly, grains large enough to be called pebbles, the sandstone is said to be *conglomeratic*; and if the pebbles or stones be angular, the rock is described as a *brecciform sandstone*. Coarse-grained *grits* and *pebbly* or *conglomeratic sandstones* pass into *conglomerate* or *puddingstone*, which consists of a mass of various sized water-worn stones. *Brecciform sandstones* frequently pass into *breccia*, which is an aggregate of angular and subangular fragments. *Graywacke* is an argillaceous sandstone, more or less altered and sometimes semicrystalline, met with among Palæozoic formations.

Arenaria. See SANDWORT.

Arenberg (*Aremberg*), from 1644 till 1820 a small sovereign duchy of Germany, lying between Jülich and Cologne; now part of the district of Coblenz, Rhenish Prussia.

Ar'endal, a coast-town in the south-east of Norway, situated near the mouth of the Nidelf in the bay of Christiania. It is built partly on piles, partly on rock, and has been called 'Little Venice,' on account both of its picturesque appearance and of the canals which intersect it. The bay, which is protected by the island of Tromø, forms an excellent harbour, and favours the commerce of the town, which includes large exports of iron and timber. Pop. 4107.

Arends, LEOPOLD, founder of a widely popular system of stenography, was born near Wilna in Russia, December 1, 1817. Educated at Dorpat, in 1844 he settled in Berlin, where he died 22d December 1882. He wrote dramas, as well as books on popular natural history and ancient Hebrew music, but his name is best known through his 'rational stenography,' first published fully in 1860 in his *Vollständige Leitfaden*. His is the youngest of the three great rival systems in Germany—the others being those of Gabelsberger and Stolze—but

it is perhaps the most widely used, and it has been introduced into the Spanish, French, Hungarian, and Swedish languages. See WENDTLAND, *Leopold Arends und seine Schule* (Leip. 1883).

Arenicola. See SANDWORM.

Areometer, an instrument for determining specific gravity, called also the Hydrometer (q.v.).

Areop'agus, a small hill in Athens, and a famous court, so named from its meeting on the hill. See ATHENS.

Arequi'pa, a term applied primarily to a mountain in the west Cordillera of the Peruvian Andes, as also to a city at its foot, and to the southern department of Peru, which contains them both. The mountain, also called Misti, is volcanic, of the form of a truncated cone; it sometimes smokes, and has a height of 18,500 feet. Its neighbourhood is subject to earthquakes. The city, in a rich valley, 7700 feet above the sea, is the third largest in Peru, being inferior only to Lima and Callao, and contains about 35,000 inhabitants. It carries on a considerable trade both with the interior and by sea; especially since the opening of the remarkable railway from the port of Mollendo across the mountains to the Titicaca Sea, which passes Arequipa. This neighbourhood is fruitful and well cultivated. The department is bounded N. by Lima, and W. by the Pacific. It has an area of 27,744 sq. m., and a pop. (1876) of 160,282. Like nearly the whole of the maritime region of Peru, the soil is generally arid and sterile.

A'rés, the Greek god of war, or more particularly of its horror and tumult, was the son of Zeus and Hera, and one of the favourites of Aphrodite. He is represented in Greek poetry as a most sanguinary divinity, delighting in war for its own sake, and in the destruction of men. Before him into battle goes his sister *Eris* ('Strife'); along with him are his sons and companions, *Deimos* ('Horror') and *Phobos* ('Fear'). He does not always adhere to the same side, like the great *Athena*, but inspires now the one, now the other. Nor is he always victorious. Diomed, by the help of *Athena*, wounds him, and in his fall, says Homer, 'he roared like nine or ten thousand warriors together.' Such a representation would have been deemed blasphemous by the ancient Roman mind, imbued as it was with a solemn Hebrew-like reverence for its gods. The worship of Ares was never very general in Greece; it is believed to have been imported from Thrace. There, and in Scythia, were its great seats, and there Ares was believed to have his chief home. He had, however, temples or shrines at Athens, Sparta, Olympia, and other places. On statues and reliefs he is represented as young and of great muscular power, either naked or clothed with the chlamys. The Romans identified their national war-god Mars with the Greek Ares. See MARS.

Areteus, a Greek physician of Cappadocia, who flourished about 100 A.D. He is considered to rank next to Hippocrates in the skill with which he treated diseases; was eclectic in his method; and in the diagnosis of disease is superior to most of the ancient physicians. The first four books of his great work, preserved nearly complete, treat of the causes and symptoms of diseases; the other four, of the cure of the same. There is an edition by Adams (1856), and an English translation (1837).

Arethu'sa. See ALPHEUS.

Aretin'ian Syllables are the syllables *ut, re, mi, fa, sol, la*, used by Guido of Arezzo for the names of the notes in his musical scale. See GUIDO, SOLFEGGIO.

Aretino, PIETRO, an Italian poet of the 16th century, was the natural son of a nobleman named Luigi Bacci, and was born at Arezzo, in Tuscany, in 1492. Banished from his native town, he went to Perugia, where he wrought as a bookbinder, and afterwards wandered through Italy in the service of various noblemen. At Rome, he distinguished himself by his wit, impudence, and talents, and secured even the papal patronage, which, however, he subsequently lost by writing his sixteen shameless *Sonetti Lussuriosi*. He now went to the Medicean court, where John de' Medici grew fond of him, and even procured him an opportunity of ingratiating himself with Francis I. at Milan in 1524. A few years later, he settled at Venice, where he also acquired powerful friends. The Bishop of Vicenza not only soothed the irritation of the pope against Aretino, but also recommended him to the Emperor Charles V. The latter, as well as his chivalrous rival, Francis, and other great persons, pensioned the fortunate wit, besides enriching him with splendid presents. It is said that while laughing heartily at a roll adventure of one of his sisters, he fell from a stool, and was killed on the spot (1557). His poetical works include five witty comedies and a tragedy of some merit. His satire procured for him the name of 'the Scourge of Princes;' but it seems clear that he was equally well fitted to be their sycophant. Although the very impersonation of licentiousness, he had nevertheless the impudence to publish some books of a devotional kind, with the view of obtaining the favour of the pope. Aretino's letters, and those written to him by various eminent men, contain much interesting information regarding his life and times. Nothing in the history of Italian literature is more extraordinary than that this coarse, dissolute, and comparatively ignorant man should have been praised, courted, and almost worshipped as he was. See the *Lives* of him by Charles (Par. 1873), Sinigaglia (Naples, 1882), and Samosch (Berl. 1881).

Arezzo (anc. *Arretium*), the chief city of an Italian province, is situated in a fertile valley near the confluence of the Chiana with the Arno, 38 miles ESE. of Florence. Arezzo was one of the twelve cities of the ancient Etruscans, and was famous for its pottery. It was devastated by Sulla during the Social war; was sacked by the Goths; and during the contest of the Guelphs and Ghibellines, fought stoutly for the latter, but ultimately became subject to Florence. The Piazza Grande, built by Vasari, is remarkable; the church Santa Maria della Pieve is founded on the site of a heathen temple. The Gothic cathedral (begun 1277) has a splendid high altar in marble by Giovanni Pisano; and the several churches contain fine specimens of the Tuscan school of painting. The city produces silk, and manufactures cloth, combs, and pottery; and it has a museum, library, and academy of sciences. Perhaps no city of its size has produced a greater number of celebrated men, among whom may be mentioned Petrarch; the poet Aretino; Guido of Arezzo, inventor of the musical scale; Cesalpino, the botanist; Pope Julius III.; and Vasari, author of *Lives of the Painters*. Pop. (1881) 11,816.

Argala. See ADJUTANT.

Argali (*Ovis argali*; also *Ovis ammon*), the great wild sheep of Siberia and Central Asia. It is found from Kamchatka to the Himalaya Mountains, where, however, it is only seen in the more elevated regions. 'We came suddenly,' says Dr Hooker in his *Himalayan Journal*, 'upon a flock of gigantic wild sheep, feeding on scanty tufts of dried sedge and grass; there were twenty-five of these enormous animals, of whose dimensions the term

sheep gives no idea; they are very long-legged, stand as high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when detached and bleaching on the barren mountains of Tibet.' The horns of the male, which he uses for fighting, are nearly 4 feet long, and 14 inches in circumference at the base, where they are triangular. The general colour is dark gray, paler beneath, with a whitish disk around the tail. The wool is concealed by hair. The tail is a mere stump, an inch or so long. They are very keen-sighted, quick of hearing, and

Argali Sheep.

with a delicate sense of smell; they keep persistently to one place, and are little disturbed by the natives. They have great powers of leaping, even from heights of 20 or 30 feet. A similar but smaller form is also found on the Himalaya Mountains. The White-breasted Argali (*Ovis poli*) is another closely allied form inhabiting Northern Tibet. The Rocky Mountain sheep, or Big-horn (*Ovis montana*), which is sometimes called the American Argali, has very similar characters. See SHEEP; and for details as to Argali, Prejevalsky's *Mongolia* (1876).

Argan (*Argania sideroxyylon*, *Sideroxyylon spinosum* of Linnaeus), a low spiny evergreen tree of the natural order Sapotaceae, a native of Southern Morocco, bearing an ovate drupe about the size of a plum, dotted with white, and with white milky juice. The Moors extract an oil from the fruit, which they use with their food.

Argand, AIMÉ, physician and chemist, was born at Geneva in 1755. He was the inventor of the well-known *Argand lamp*. In the ordinary oil-lamp, combustion was not complete. Argand's improvement was that he made the wick in the form of a ring. The flame thus became a hollow cylinder with a current of air ascending through the inside, so that the burning surface was doubled. It would appear, however, that the lamp did not satisfy the expectations of Argand, till his younger brother accidentally discovered the effect of a glass cylinder, as a chimney over the flame, by which the flame was steadied, a draught created, and the greatest possible amount of light yielded. Argand was soon involved in a dispute with Langé, a Parisian, regarding the originality of his invention, but ultimately he

Argand Gas-burner.

consented to share the honour; and a French patent was obtained by Langé and Argand jointly. The French Revolution destroyed their privilege, and Argand lived for a time in England; he died in 1803. The same principle is employed in the Argand gas-burner. Gas is admitted by means of a side tube (A in the fig.) into the space between two concentric cylinders. This space is closed at the bottom, but the gas escapes at the top through a series of small openings. The air has free access to the outside of the flame, and also to the inside, since the internal cylinder is open above and below.

Argaum', a village in Berar, India, between Ellichpur and Aurungabad. Near it, on 28th November 1803, about two months after the battle of Assaye, Wellesley gained another victory over the Mahrattas.

Argel, or ARGHEL (*Solenostemma argel*), a plant of the order Asclepiadaceæ, a native of Arabia and of the north of Africa, deserving of notice only because of the frequent use of its leaves for the adulteration of senna. They are lanceolate and leathery, and may readily be distinguished from genuine senna leaves by their texture, their being downy, their greater heaviness, the comparative absence of veins, and the symmetry of their sides, the sides of the true senna-leaves being unequal. They are acrid, and are said to cause sickness and griping, but seem to possess little or no purgative properties.

Argelander, FRIEDRICH WILHELM AUGUST, an eminent astronomer, was born in 1799, at Memel. He studied at Königsberg, and was drawn to astronomy by the lectures of Bessel. In 1820 he was appointed assistant to Bessel in the Königsberg Observatory, and in 1823 chief of the observatory of Abo, in Finland. Here he commenced a series of observations on the fixed stars which have a perceptible 'proper motion'; observations continued in a new observatory at Helsingfors, where he published a catalogue of not less than 560 stars having 'proper motions.' After removing finally to the university of Bonn in 1837, he published his *Uranometria Nova* (1843), containing celestial charts of the fixed stars seen in our hemisphere with the naked eye; also (1846) his *Astronomical Observations*, containing the results of an examination of the northern heavens from 45° to 80° declination. His *Atlas of the Northern Heavens* will combine with these works to perpetuate his memory. Argelander was long engaged in a series of observations on the changes of light in variable stars, and he also demonstrated the theory that there is a progressive motion of the solar system in space. He died 17th February 1875.

Arge'moné, a genus of American plants of the natural order Papaveraceæ; from the *A. mexicana*, sometimes called Mexican Poppy. A useful oil is obtained from it, and the seeds are narcotic.

Argensola, LUPERCIO and BARTOLOMEO DE, poets, styled the 'Spanish Horaces,' were born in Aragon; the former in 1564, the latter in 1565. They held in succession the post of historiographer royal of Aragon; and both spent some years at the court of the viceroy of Naples. The elder brother died in 1613, the younger in 1631. Their collected poems, first published in 1634, consist of epistles, odes, sonnets, and satires, and are imitative of the style of the Latin poets. They also published historical works.

Argent, the French word for silver, is always used in English heraldry to signify that metal. In engraving shields, it is left white.

Argenta, a town of Central Italy, 21 miles SE. of Ferrara by rail. Pop. 3000.

Argentan, a Norman town in the French department of Orne, on the river Orne, 42 miles SSE. of Caen by rail. It has an ancient castle, now the *palais de justice*, and two Gothic churches. It has manufactures of linen, lace, and gloves. Pop. (1881) 5663.

Argenteuil, a town in the French department of Seine-et-Oise, on the Seine, 6 miles NW. of Paris. Its priory, now in ruins, was founded in 656, and was by Charlemagne turned into a nunnery, of which the famous Heloise became abbess. Wine and vinegar are made here, and gypsum is quarried in the neighbourhood. Pop. (1881) 10,167.

Argentæus Codex. See ULFILAS.

Argentine (*Argentina*), a genus of small bony fishes of the family Salmonide. One species (*A. Yarelii*) is rarely found on the British and Northern European shores, some are North American, and two or three occur in the Mediterranean. They are chiefly remarkable for the silvery lustre of their sides, and the abundance of *nacre* (used in making artificial pearls) with which the fibrous walls of their air-bladder are externally loaded. They are sometimes fished for the sake of this substance, and are commonly taken in nets along with anchovies or sardines.

Argentine Republic, sometimes simply called ARGENTINA, is a federal republic of South America, taking its name from the river La Plata ('River of Silver,' a misnomer). It has an area of 1,125,086 sq. m., including the unsettled territories on the north and the south, but the organised and settled provinces occupy less than one-half this area. The whole country is more than ten times larger than Great Britain and Ireland taken together. The republic is made up of fourteen provinces and a number of territories as follows: (1) The coast provinces of Buenos Ayres, Santa Fé, Entre-Rios, and Corrientes; (2) the Andean provinces of La Rioja, Catamarca, San Juan, and Mendoza; (3) the central provinces of Cordoba, San Luis, Santiago del Estero, and Tucuman; (4) the northern provinces of Salta and Jujuy; (5) the territory of the Pampa; (6) the territories of Neuquen, Rio Negro, Chubut, Santa Cruz, and Tierra del Fuego in the south (these together comprising the greater part of what is known as Patagonia); and (7) the northern territories of Misiones, Formosa, and Chaco. On the west, the Andes divide this republic from Chili; Bolivia bounds the country on the north, while Paraguay, Brazil, Uruguay, and the Atlantic Ocean form the eastern limit. The great island-group of Fuegia, on the south, belongs partly to this republic and partly to Chili.

The physical features of the country are easily described; except for the sub-Andean foot-hills, and a few other local and unimportant hilly or mountainous tracts, nearly all the country consists of vast plains or pampas. The northern plain region (the Chaco) is in part densely wooded; but most of the Pampas country is open, presenting wide ranges of treeless pasture, varied by patches of huge thistles and other coarse plants. In the Patagonian region there are extensive districts completely covered with stones and shingle, interspersed with clumps of thorny brushwood, and having in the hollows many strongly saline ponds or lakes.

The native animals include the guanaco, the fox, the skunk, the chinchilla, the nutria, the biscacha, and various species of ant-eater, armadillo, deer, and peccaries. Thousands of wild cattle and horses, descendants of stock of Spanish importation,

inhabit the remoter districts; but the systematic pasturage of live-stock (the main industry of the country) is reducing the range of the wild cattle. Bird-life is singularly rich and varied. The rhea nandu, or American ostrich, is one of the most remarkable species. Humming-birds, parrots, and flamingos are among the conspicuous birds.

The climate in the extreme north is very hot, for it lies north of the tropic of Capricorn. The more remote southern territories have an extremely bleak, windy, and disagreeable climate, but are not really so cold as might be expected from their relatively high latitude. But the country in general enjoys an equable, temperate, and healthful climate. The littoral region is subject to high winds, called *pamperos*, which often extend far out to sea. The people of the country are mostly Spanish in their language and descent, but there are many Italians, French, and other European immigrants. The *Gauchos*, or herdsmen of the plains, are a hardy and spirited, but ignorant race, often of partial Indian descent. Some of the Indians of the remote districts have become skilled in the rearing of flocks and herds. Agriculture has of late been rapidly extended. Wheat, maize, flax, and linseed are exported; but the chief staples of export are skins, hides, hair, bones, bone-ashes, horns, phosphorus, ostrich-feathers, wool, tallow, dried and salt beef, beef-extract, fresh meat (frozen), and live animals. The recent great extension of the railway lines has done much to develop the country. The greater part of the republic is well watered and highly fertile, but there are extensive regions of waste land. The various fruits of European culture all find the conditions for growth in this country. The imported vine and the apple-tree in some places have so spread that they form great thickets, and afford much food even to the wild tribes of the southern territories. Sugar-culture thrives in the NW. and north. Wines, spirits, and dried fruits are extensively produced; a valuable product of the north is *mate*, or Paraguay tea.

The mineral resources of the country are comparatively undeveloped. In the sub-Andean regions, chiefly to the NW., some gold, copper, lead (said to be valuable), and silver are obtained. Salt, iron, alum, lime, marble, cement, and coal, are among the minerals of the country. Rich deposits of gold are reported to occur in Patagonia.

The principal seaport is Buenos Ayres, the capital and largest city. Situated on the great La Plata estuary, its commerce has been hindered by the shoalness of its water-approaches; but extensive engineering works have in part overcome the difficulties of navigation. The Patagonian coast has many large bays, but is very dangerous, and is also deficient in good harbour facilities. The rivers Paraná and Uruguay, with their large tributaries, are important channels of trade. The principal articles of manufacture are cattle-products, sugar, spirits, flour, furniture, &c. The manufacturing industries are receiving much attention. The population of Buenos Ayres in 1886 was 398,498. Among the other large towns are Cordoba (50,000), Rosario (45,000), La Plata (26,000), Mendoza, Tucuman (26,000), Corrientes, Santa Fé, Gualaguay, Gualaguaychu, Paraná, Salta, San Juan, San Nicolas, and Santiago. Rosario de Santa Fé, Corrientes, and Paraná are important river-ports, and the first-named has a very large trade. Ensenada (adjoining the town of La Plata) and Bahia Blanca are seaports of rising importance. The nearly completed Trans-Andean railway will probably divert much of the direct trade of Chili to Argentine ports. At present there is very little trade and not much overland communication with Chili, owing to the difficulty of crossing the high

intervening mountain-ridges. The commerce of the country is very largely with Great Britain and France. France purchases over one-fourth of all the Argentine exports, and Britain takes about half as much of the exports as France. But of the Argentine imports, nearly 40 per cent. is received from Great Britain. The United States have only a very limited direct commerce with the Argentine republic.

The Roman Catholic is the established religion, but others are tolerated. Education is provided for by law, and many schools are sustained at public cost; among them being normal, mining, agricultural, and training schools. There are universities at Buenos Ayres and Cordoba, and connected with the latter is the national astronomical observatory.

The population of the country in 1869 was 1,736,922; in 1882 it was officially estimated at 2,942,000 (less than 3 to the square mile), of whom 1,907,000 were Argentines, and no fewer than 339,000 of Italian birth, 161,000 Spanish (very many of whom are Basques), 153,000 French, 51,000 English, and 54,000 German and Swiss. The large number of Italians is a conspicuous feature of the population. Much of the increase is due to immigration, nearly 400,000 immigrants having entered the country in the five years, 1881-86; of whom 70 per cent. were Italians, 10 per cent. Spaniards, and 8 per cent. French.

The government is closely modelled upon that of the United States. In the executive, legislative, and judicial departments alike, is this resemblance very conspicuous. The total debt of the republic amounts to more than £42,500,000; and loans have also been negotiated by several of the provinces separately. The budget for 1887 showed an estimated income of £9,700,000, and an expenditure of £9,475,000; but for some years past the annual expenditure has exceeded the annual revenue. The army and navy are recruited by voluntary enlistment. In 1886 the army strength was 8720, including a large proportion of officers; and the national guard was returned at 347,653. The navy included 3 ironclads, 6 gunboats, 8 torpedo-boats, all of good classes, and over 20 other steamers, mostly of a small size.

In 1886 the length of railway lines open for traffic was 3350 miles (extending from Buenos Ayres to Mendoza, with a projected extension across the Andes to meet the Chilean railways, and to Tucuman), and 815 miles more were in course of construction. Above 15,000 miles of telegraph-wires stretched through the country, and over them about 600,000 messages passed within the year. There are about 600 post-offices, and the service in 1886 carried over 20,000,000 letters, and 15,000,000 newspapers.

The river La Plata was visited by the Spaniards in 1516, and the country was colonised in 1535, when Buenos Ayres was founded. For many years the country was regarded as a part of Peru. The progress of the colony was not more hindered by the bloody wars which prevailed with the natives for a hundred years, than by unwise legislation at Madrid. In 1776 Buenos Ayres became the capital of a new viceroyalty. In 1806 that capital was occupied by a British force under General Beresford, but the town was soon besieged and compelled to surrender. In 1808 the British forces under Whitelock assailed the town, but after very severe loss, were themselves compelled to capitulate. In 1810 the colonists founded a local provisional government. A sanguinary war for independence followed, which did not cease till 1824. Spain acknowledged the independence of the country in 1842. The first half-century of Argentine autonomy was much disturbed by revolutions. The Brazilian-Argentine war against

Paraguay (1865-70) was interrupted and followed by renewed revolts at home. But latterly the great material progress of the country has been accompanied by an equally remarkable movement in favour of stability of government and the repression of factions. The policy of the government towards agricultural immigrants is highly liberal. An interesting colonial experiment has resulted in the establishment of the town and territory of Chubut, in Patagonia, peopled mainly by Welsh settlers. No other South American country has made such widespread and rapid improvement as this. See Mulhall, *Handbook of the River Plate* (1884); M. F. Paz Soldan, *Geografía Argentina* (1885); Lady F. Dixie, *Across Patagonia* (1880); G. Bove, *Patagonia Terra del Fuoco* (1883); and the recent British and American *Consular Reports*, some of which are full of important and interesting information.

Arges, a genus of small bony fishes belonging to the family Siluridae. They are found in mountain-lakes among the volcanoes of the Andes, which lie in some cases 10,000 feet above the level of the sea. During volcanic eruptions these fishes are cast in such extraordinary numbers over the soil that they sometimes cause disease among the inhabitants. According to Humboldt's account (1805), they are ejected along with torrents of hot muddy water from the craters and sides of the volcanoes, at an elevation of 16,000 feet above the sea. The form which he described he called *Pimelodes cyclopum*, but the two or three species now known are referred to the genus *Arges*. The local name is *Preñadilla*. *Brontes* and *Astroblepus* are closely allied genera. Humboldt's account of their ejection has been accepted, but renewed observations as to the exact habitat of the fishes are desirable.

Argile Plastique, a series of beds near the base of the Eocene system in France. They consist of extensive deposits of sand, with occasional beds of plastic clays, used for pottery. Marls occur, inclosing, in some places, the fluviatile shells that are met with in the same position in the London basin, and in others, large numbers of a species of oyster. Beds of impure lignite (*Lignites du Soissonais*) also occur.—The argile plastique is the equivalent in the Paris basin of the Woolwich and Reading series of the English geologists. See EOCENE.

Argillaceous Rocks. All rocks composed entirely or to some extent of clay are included under this title. Pure clay is known as *kaolin* or *porcelain clay*. It is a hydrated silicate of alumina. Decomposed felspar, from which the silicates of potash, soda, &c. have been washed out, supplies the material which forms kaolin. *Common clay*, however, contains many impurities; the chief are sand, in variable proportions, and oxide of iron, which gives its colour to the mass. Any matter that contains sufficient alumina (more than 10 per cent.) to enable it to retain its shape when moulded and pressed, is called clay. Plastic clays occur abundantly in the superficial deposits and in the Tertiary strata. The older clays become more or less indurated; many, however, are plastic. The carboniferous strata yield *fireclays*, which are much used for the manufacture of brick for ovens, furnaces, &c. When indurated argillaceous rocks are regularly laminated, and split into thin layers in the direction of the laminae, they are called *shale*. In *clay-slate*, the clay has become highly indurated and metamorphosed, so as to split into plates that are altogether independent of the original lamination, and frequently cross it at right angles.

Argol is a crude variety of cream of tartar which forms a crust in the interior of wine-vats

and wine-bottles. Originally, it exists in the juice of the grape, and is soluble therein; but during the fermentation of the juice, and as it passes into wine, much alcohol is developed, which remaining in the fermenting liquor, causes the precipitation of the argol; the latter being very sparingly soluble in an alcoholic liquid. Some wines, when they are bottled, are not fully ripe, and more alcohol being thereafter developed, a further precipitation of argol takes place as a crust in the bottles, and hence the meaning of the term *crusted port*. Argol is generally of a reddish tinge, obtained from the colour of the grapes, but sometimes is of a grayish-white colour, when it has been deposited during the fermentation of the juice of colourless grapes. The red or white argol is denominated in commerce *crude tartar*, and its principal uses are in the preparation of Cream of Tartar and Tartaric Acid (q.v.). The constituents of argol are bitartrate of potash (cream of tartar), tartrate of lime, with colouring and extractive matters.

Argölis, the north-eastern peninsula of the Morea of Greece, lying between the Bays of Nauplia and Ägina. Together with Corinth, it forms one of the thirteen provinces of the kingdom of Greece, with an area of 1442 sq. m., and a pop. (1879) of 136,081. Its capital is Nauplia. The plain of Argos, famous in ancient times for its breed of horses, is naturally fertile, but is now made pestilential by morasses. It is the most extensive in the whole peninsula, being 12 miles in length and 5 in breadth. Here was the Lernean marsh of antiquity. It is surrounded by an eastern continuation of the range of mountains on the north of the Peloponnesus, which also girds the river and shattered-looking coast. The highest summits attain an elevation of between 5000 and 6000 feet.

The modern town of Argos is built on the site of the ancient city, 7 miles from Nauplia. It has still remains of its cyclopean walls, as well as of a grand rock-hewn amphitheatre. Cotton, vines, and rice are grown. Pop. (1879) 9861.

By Argos, Homer frequently means the whole Peloponnesus, the most important part of Greece; hence the Greeks collectively are often styled *Argives*. The same name, however, he applies to Agamemnon's own kingdom of Argos, of which Mycenæ was the capital, and to the city of Argos itself. Herodotus applied the name Argolis to the district of Argos; and later under the Romans, Argos meant only the town, Argolis the district; but the latter name included a much wider territory than the Argos of Greek independence, which meant merely the country lying round the Argolic Gulf.

The ancient capital, Argos, was situated about 3 miles from the sea, and was considered the oldest city in Greece. Supposed to have been built by Inachus, or by his grandson Argus, it was a famous city during the mythical ages; and when it may be said to appear first in history, about 750 B.C., we find it, under its ruler Phidon, the chief state of Peloponnesus. Latterly, Sparta robbed it of its supremacy and influence. It sided with Athens in the Peloponnesian war, joined the Achaean League in 243 B.C., and became part of the Roman province of Achaia in 146. The city was specially noted for its worship of Hera. It has one of the most famous of the ancient schools of statuary, and its natives were renowned for their love of music; but few poets, and no orators or philosophers, were born amongst them.

Argonaut. See NAUTILUS.

Argonauts, heroes of Greek Mythology (so named from their ship *Argo*), who undertook a long voyage into unknown seas, under the command of Jason. The story is alluded to in the

Odyssey, and is related by Hesiod, and, among later writers, with great fullness by Apollonius Rhodius and Apollodorus, but the discrepancies are numerous and irreconcilable. The common story is as follows: In Iolcus, in Thessaly, reigned Pelias, who had unjustly taken the crown from his half-brother Æson. In order to get rid of Jason the son of Æson, the usurper commissioned him to fetch from the country of Æetes (Colchis) the golden fleece of the ram which had carried Phrixus in safety through the air. The ram had been the gift of Hermes; and Phrixus, after reaching Colchis safely, sacrificed it to Zeus, and gave the fleece to Æetes, who hung it up in the grove of Ares, on an oak-tree guarded by a sleepless dragon. Jason therefore caused Argus, the son of Phrixus, to build a ship of fifty oars; and for this adventure gathered together the bravest heroes from all parts of Greece, fifty in number, with whom he sailed. Their first landing-place was Lemnos, which they found inhabited entirely by women who had slain all their husbands. They were kindly received, and admitted to the closest intimacy. Next they sailed along the coast of Thrace, up the Hellespont to the Doliones, and were hospitably received by King Cyzicus, who was afterwards accidentally killed by Jason. After landing at Mysia, where they left Hercules and Polyphemus—who had wandered too far inland in pursuit of the lost Hylas—they came to the country of the Bebryces, whose king, Amycus, was killed by Pollux in a boxing-match. They next sailed along the coast of Thrace to Salmydessus, where the blind seer, Phineus, was tormented by the Harpies. Zetes and Calais, the two winged sons of Boreas, having delivered him from them, the aged prophet forewarned them of the dangers of the voyage and the precautions they should adopt, and especially warned them against the dangerous passage between the terrific rocks, the Symplegades, which alternately opened and shut so quickly that even a bird could scarcely pass safely through. When the *Argo* arrived at this place of danger, Euphemus let loose a dove in order to judge from its fortune what they themselves might expect. The bird escaped with the loss of its tail. The mariners resolved to risk the passage, and after rowing with all their might, while the powerful arms of Athena held the rocks asunder for a moment, got safely through, their ship only losing some of the ornaments of its stern.

Halting a while on the coast of the Mariandyni, where the seer Idmon and the helmsman Tiphys died, they sailed along the coast till they arrived at the mouth of the river Phasis, in Colchis. Here King Æetes promised to give up the golden fleece to Jason, on condition that the latter should yoke to a plough two fire-breathing bulls with brazen hoofs, and should sow the dragon's teeth not already sown by Cadmus in Thebes. Jason, by the help of the famous sorceress Medea, daughter of Æetes, who had fallen passionately in love with the bold navigator, fulfilled these conditions; and was also assisted by Medea in still more wonderful exploits. He obtained from her, under promise of marriage, a charm against fire and steel, and was enabled to destroy all the warriors who sprang up from the land sown with the dragon's teeth. While Jason was engaged in this task, Æetes formed a plan to burn the ship *Argo*, and put the crew to death; but Jason, informed of the scheme by Medea, anticipated it, hastened into the grove, stupefied the dragon-sentinel by an opiate-charm prepared by Medea, seized the golden fleece, and, embarking in the *Argo* with his mistress and her brother Abeyrtus, sailed away from Colchis by night. Æetes followed, but before he overtook them, Medea slew her brother Abeyrtus, and cut him into several pieces, which she threw overboard, one

at a time. While King Æetes stayed to gather up the fragments, he gave Jason time to escape from the pursuit. The Argonauts now reached the mouth of the river Eridanus, but were driven on the Abeyrtian Islands by a storm sent from Zeus, who was angry on account of the murder of Abeyrtus. Meanwhile the mast of the *Argo*—which had been cut from the sacred grove of Dodona—delivered an oracle to the effect that Zeus could not be appeased unless they sailed towards Ausonia, and were purified through the expiatory agency of Circe. This was accomplished; and next the mariners passed by the Sirens, from whose charms they were preserved by Orpheus, who sang to them, but could not hinder one of their number, Butes, from swimming off to the sea-maidens; then through Scylla and Charybdis, by the help of Thetis, and at length landed on the island of Coreyra, where Alcinous ruled. On leaving this place, they encountered a storm at night, but were saved by Apollo, who in flashes of lightning revealed to them the haven of Anaphe, where they raised an altar to their preserver. At Crete, their landing was opposed by the brazen giant Talus, who was slain by the artifices of Medea. They subsequently touched at Ægina, and sailing between Eubœa and Locris, arrived safely at Iolcus. Jason dedicated the good ship *Argo* to Poseidon, at the Isthmus of Corinth.

Such is the epic and localised Greek form of a story more widely diffused than perhaps any other. It is an arrangement with local and quasi-historical features of a number of incidents common not only in European but in savage folk-lore. Grote dates the poetic elaboration of the story between 600 and 500 B.C. The situation from which the story starts is a familiar commonplace in folk-tales: a child in danger at home of being eaten, sacrificed, cheated of his birthright, or at least oppressed by a cruel stepmother, escapes by means of a gifted animal. Further common features are the attempt to evade prophecy, the arrival of the true heir, the endeavour to get rid of him by sending him on an impossible adventure, on which he starts accompanied by friends endowed with miraculous powers. The hero comes to the house of a powerful and malevolent being, becomes the lover of his daughter, and performs by her aid the impossible tasks imposed. The pair fly, throwing behind them in their flight various objects to detain the pursuer, often a comb which grows into a forest, or the like. How closely Jason's corresponds to the common story is at once obvious. He is the typical adventurer; his Argonauts are endowed with the usual supernatural powers of seeing, hearing, flying; the powerful and malevolent being is King Æetes; the daughter who falls in love with the adventurer, Medea. Mr Lang has collected variants of the story from Samoyed, Epirot, Kaffir, Malagasy, Algonquin, Gaelic, Norse, Russian, Italian, Japanese, and Samoan sources. This is not the place to discuss the question whether the same romantic series of incidents were invented through mere accidental coincidence by such widely different races, or whether the story, once known, drifted all round the world. But the fact of the universality of the story makes it unnecessary to discuss the rationalising of Greek geographers and historians like Strabo and Arrian. It is as idle to linger over the explanations of Sir George Cox and his school, discredited as these are by their own differences. Jason may be 'the violet-tinted morning from which the sun is born,' 'the far-darting ray of the sun' himself, or 'the spring with its soft suns and fertile rains'; while Medea may represent the dawn, the moon, or a lightning goddess, as the reader pleases. See Grote's *History of Greece*, vol. i.; 'A Far-travelled Tale' in Lang's *Custom and Myth* (1884); and Lang's Introduction

to Mrs Hunt's translation of Grimm's *Household Tales* (1884).

Argos. See ARGOLIS.

Argos'toll, a seaport of the Ionian Islands, the capital of Cephalonia, is the seat of a Greek bishop, and has a good harbour, with quays a mile in length. It was almost destroyed by an earthquake in 1867. Near it are the 'sea-mills of Argostoli,' two holes in the rocky coast, into which the sea pours with a force sufficient to drive two mills, and disappears, to return, most likely, through brackish springs. Pop. 7871.

Argot. See SLANG.

Arguelles, AUGUSTIN, born in Asturias in 1776. On the outbreak of the War of Independence (1808), he attached himself to the patriotic party, and as representative of his native province in the cortes, gained a high reputation for eloquence (1812-14). On the restoration of Ferdinand VII., Arguelles was arrested, and suffered ten years' barbarous captivity, till the revolution of 1820 restored him to freedom. For a few months he was Minister of the Interior, but on the fall of the constitution (1823) he fled to England, where he remained till the amnesty of 1832. On his return to Spain, being nominated to the cortes, he was repeatedly made president and vice-president of the Chamber of Deputies, and always showed himself a moderate but unwavering reformer. He died at Madrid, March 23, 1844.

Argument (Lat. *argumentum*), in Logic, means properly the ground or premiss on which a conclusion is rested; popularly, it is applied to a series of arguments, or to a controversy. Logicians have given distinctive names to various kinds of arguments. The *argumentum ad hominem* is no real proof, but only an appeal to the known prepossessions or admissions of the persons addressed. The *argumentum ad veritatem*, again, has no regard to anything save objective truth. The *argumentum e consensu gentium*, is an appeal to the common belief of mankind. A good example of this is the well-known proof of the truth of Catholic doctrine: *Quod semper, quod ubique, quod ab omnibus*. The *argumentum a baculo*, the use of the cudgel, is concise in its style, and has settled many controversies.

Argus, the son of Zeus and Niobe, third king of Argos, which took from him its name.—ARGUS, son of Agenor, or of Inachus, surnamed Panoptes ('all-seeing'), had one hundred eyes, some of which were always awake. Hence Hera appointed him to watch over the cow into which Io had been transformed. Hermes being commissioned by Zeus to carry off the cow, slew Argus by stoning him; or, as Ovid says, first charmed him to sleep by playing on the flute, and then cut off his head. Hera put his hundred eyes in the tail of the peacock, her favourite bird.—ARGUS, the builder of the ship *Argo* (see ARGONAUTS).

Argus, a genus of gallinaceous birds, remarkable for magnificence of plumage. The only known species is *Argus giganteus*, formerly called *Phasianus Argus*, and still very generally the argus pheasant. The bill is nearly as long as the head; the sides of the head and of the neck are almost destitute of feathers; the tail consists of twelve feathers, of which the two middle ones in the male are very much elongated, and the secondary feathers of the wings are much longer than the primary. The name argus has allusion to the many beautiful eye-like markings which adorn the plumage of the male, and particularly the secondary wing-feathers. The primary feathers are also exquisitely marked. The ornaments are hidden except when the male shows himself off to

his mate. 'He then erects his tail, and expands his wing-feathers into a great, almost upright circular fan or shield, which is carried in front of the body. The neck and head are held on one side,

Argus Pheasant (from Darwin).

so that they are concealed by the fan; but the bird, in order to see the female before whom he is displaying himself, sometimes pushes his head between two of the long wing-feathers, and then presents a grotesque appearance.' The marvellous decoration, according to Darwin, serves solely as a sexual charm, and the development of the ball-and-socket or eye-like markings, which he has shown to be connected by a perfect series of gradations with the simple spots, affords beautiful illustration of variation associated with *Sexual Selection* (q.v.). The decorative development seems really to have gone too far, for the size of the secondary wing-feathers is said almost to deprive the male bird of the power of flight. The female is of comparatively tame plumage, not only wanting the eye-like markings, but also the great length of the secondaries and of the middle tail-feathers. The size of the bird, when divested of its plumage, is not much greater than that of a common barn-door fowl; but the total length of the male, including tail-feathers, is over 5 feet, and the secondaries alone may be almost 3 feet long. The argus is a native of Sumatra and other eastern islands, of the peninsula of Malacca, Siam, &c. It is said to be found even in the northern parts of China. It is impatient of confinement, and has very seldom been brought alive to Europe. See Darwin, *Descent of Man*.

Argyll, ARCHIBALD CAMPBELL, MARQUIS OF, was the descendant of Sir Colin Campbell of Lochow or Loch Awe, who was knighted in 1286, and who through his prowess bequeathed to the chiefs of his line the Gaelic title of Mac Cailean Mhor or Mac Callum More ('great Colin's son'). Sir Duncan Campbell of Lochow was raised to the peerage as Lord Campbell in 1445; and Colin, his son, was created Earl of Argyll in 1457. The second earl fell at Flodden (1513); the fourth, who died in 1558, was the first of the Scottish nobility to embrace the Reformation principles; and the fifth (1530-73) figured prominently in Mary's reign, first as a Lord of the Congregation, and next as an adherent of the queen. ARCHIBALD was born in 1598, and in 1619, his father having turned Catholic and quitted Scotland, became the sole potentate of all the broad lands of his line.

He succeeded as eighth earl in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to the king and of faith in the principles against which the king made war. In the General Assembly at Glasgow (1638), he openly took the side of the Covenanters, and next year he joined Leslie's encampment on Duns Law. In 1640 he marched with 4000 men through Badenoch, Athole, Mar, and Angus, enforcing subjection to the Scottish Parliament. Charles, on his visit to Scotland in 1641, found it expedient to show peculiar favour to Argyll, and raised him to the dignity of marquis. In 1644 he dispersed the royalist forces under Huntly; but he was less successful in withstanding the genius of Montrose, who in 1645 annihilated his army at Inverlochy. His estates had suffered so much from Montrose's ravages, that in 1647 £40,000 of the public money was voted for the support of himself and his clansmen. He was strongly opposed to the execution of the king; and in 1651 he crowned Charles II. at Scone, having previously made overtures to marry him to one of his own daughters. After the defeat of Worcester, he defended himself for nearly a twelvemonth, in his castle of Inveraray, against Cromwell's troops; but in 1652 he gave in his submission to the Protector. On the Restoration, he repaired to Whitehall, encouraged by a letter from his son; but he was at once arrested, and committed to the Tower. Thence taken by sea to Leith, he was brought before the Scottish Parliament on fourteen charges of compliance with the usurpation. He defended himself with spirit, but in vain; and on 27th May 1661 he was beheaded with the 'maiden' at the cross of Edinburgh—having displayed throughout his trial, and on the scaffold, the dignity of a true nobleman, and the meekness of a Christian. Hostile views have been taken of his character, not the most favourable being Scott's in the *Legend of Montrose*; and one point is certain—he was a coward in the field.—His son, ARCHIBALD, 9th Earl of Argyll, exhibited great bravery on the disastrous day of Dunbar, where he commanded a regiment on the royalist side. After Worcester, he continued, like his father, in arms, and made himself so obnoxious to Cromwell, that he was specially excepted from the act of grace in 1654. Acting under Charles's orders, he submitted next year to the Protectorate; but from 1657 to 1660 he was a prisoner. On the Restoration, he was received into high favour (as a balance to the execution of his father), and unfortunately for his own fame, participated in some of the iniquitous acts of the Scottish legislature. Thus, in 1681 he voted in council against Donald Cargill, and signed a letter upholding the divine right in its extremest form; yet, the same year, would only sign the new test with a reservation, which led to his trial for 'leasing-making,' and his condemnation to death. The devotion of his step-daughter enabled him to escape from Edinburgh Castle in the disguise of a page; and after remaining some time in concealment, he fled to Holland. Landing in Argyllshire, in May 1685, with an armed force, to co-operate in Monmouth's rebellion, he was, after a series of misfortunes, taken prisoner, and beheaded at Edinburgh, on his former sentence, 30th June 1685.—His son, ARCHIBALD, an active promoter of the Revolution, was created Duke of Argyll in 1701, two years before his death.—His son, JOHN, 2d Duke of Argyll, was born in 1678. Destined, says Pope, 'to shake alike the senate and the field,' he as royal commissioner in 1705 had a principal share in bringing about the Act of Union; whilst as a soldier, from 1694 he distinguished himself under Marlborough

at Ramillies, Oudenarde, and Malplaquet. Previous to the change of ministry in 1710, Argyll had been a keen Whig. He now veered with the wind of the court, and became a declaimer against Marlborough. For reward he was appointed by the Tories generalissimo of the British army in Spain; but considering himself to have been unhandsomely treated by the ministry, he shortly after returned, and finding his influence greatly diminished, again turned Whig. His tortuous career up to the '15 seriously detracts from his meritorious services during that critical period, which in 1718 gained him the English title of Duke of Greenwich. His restless vanity and ambition, however, constantly prompted him to political intrigues. In 1721 he again played into the hands of the Tories, for the purpose of securing the entire patronage of Scotland. In 1737 he rose into immense popularity in his own country, by his spirited defence before parliament of the city of Edinburgh in regard to the Porteous mob. He died 3d September 1743. He was a man of lax principles and selfish character, but possessed of considerable shrewdness and talent, and noted for a kindness and courtesy in private life, which procured him the title of 'the Good Duke of Argyll,' and which are commemorated in Scott's *Heart of Midlothian*.—GEORGE JOHN DOUGLAS CAMPBELL, 8th Duke of Argyll, was born in 1823, and succeeded his father in 1847. At the age of nineteen, he wrote *A Letter to the Peers from a Peer's Son*, on the struggle which ended in the disruption of the Scottish Church; and seven years later appeared his *Presbytery Examined*, a historical vindication of the Presbyterian system. He was Lord Privy Seal (1853-55; 1859-66) and Postmaster-general (1855-58) under Lord Palmerston. Under Mr Gladstone he was Secretary of State for India (1868-74), and Lord Privy Seal (1880-81). He resigned the last office, disapproving of the Irish Land Bill. His works include, besides numerous papers on zoology, geology, &c., *The Reign of Law* (1866); *Primer of Man* (1869); *A History of the Antiquities of Iona* (1870); *The Eastern Question* (1879); *The Unity of Nature* (1884); and *Scotland as it Was and as it Is* (1887).—His eldest son, JOHN DOUGLAS SUTHERLAND CAMPBELL, Marquis of Lorne, born in 1845, in 1871 married the Princess Louise, and from 1878 to 1883 was Governor-general of Canada. He is author of *A Trip to the Tropics* (1867); *Guido and Lita* (1875), &c.

Argyllshire, or ARGYLESIRE, a county in the west of Scotland, cut up into many peninsulas by arms of the sea, and including numerous islands. Its greatest length is 115 miles; greatest breadth, 55; and its extent of coast-line was ascertained by the Admiralty survey to be as much as 2289 miles, owing to the indentation of the coast by numerous sea-lochs. Next to Inverness, it is the largest county in Scotland, its area being 3213 sq. m., of which 623 belong to the islands. No part is more than 12 miles from the sea or from large inland lochs. The chief islands are Mull, Islay, Jura, Tyree, Coll, Lismore, and Colonsay, with Iona and Staffa. The general aspect of Argyllshire is wild and picturesque, the northern part being everywhere mountainous, and presenting some of the grandest scenery in Scotland, as Glencoe. The highest peaks are Bidean nam Bian (3766 feet) and Ben Cruachan (3689). The chief sea-lochs are Lochs Moidart, Sunart, Linnhe (branching off into Lochs Leven and Eil), Fyne, and Long. The streams are short and rapid, the principal being the Orchy, running through Glenorchy into Loch Awe, and the Awe connecting that lake with Loch Etive. The fresh-water lochs are Loch Awe and Loch Lydoch, the latter on the Perthshire border. The

rocks of Argyllshire are mica-slate, which predominates on the mainland; trap in Mull and Lorne; quartz rock in Islay and Jura; granite around Lochs Fyne and Etive; patches of lias and oolite in many of the isles; and a little old red sandstone west of Loch Fyne and in South Kintyre. Lead has been mined at Strontian (where the mineral Strontianite was discovered), at Tyndrum, and in Islay and Coll. A copper mine exists in Islay. The Easdale and Ballachulish quarries supply the best roofing-slates in Scotland. Coal occurs near Campbeltown; fine marble in Tyree, &c.; excellent granite near Inveraray; and limestone in most parts of the county. The fertile parts of Argyllshire lie along the arms of the sea and the streams. The soil is mostly a light, sandy, and gravelly loam along the coast and the sides of rivers, and gravelly, with a till bottom, on the hillsides. Whereas the total percentage of cultivated area in England is 79.3, and in all Scotland 23.5, in Argyllshire it is only 5.7. Sheep and cattle rearing is the chief occupation of the farmer, more sheep (in some years upwards of a million) being reared in Argyllshire than in any other Scotch county. Argyllshire abounds in deer and game. Loch Fyne is famed for its herrings. Loch Awe abounds in salmon and trout. In many parts of Argyllshire the peasantry are still very poor, notwithstanding that steamers now connect every portion of the coast with Glasgow, and that a railway to Oban was opened in 1880. A bill for a railway to connect the Clyde Valley with Ardrishaig and Crinan was passed in 1887. The kelp industry, introduced into Tyree in 1746, had become all but extinct in 1863, when it was partially revived. The manufactures are unimportant, the chief being whisky, in Campbeltown and Islay, and coarse woollens for home use. The principal towns and villages are Inveraray, Campbeltown, Oban, Dunoon, Lochgilphead, Tarbert, and Tobermory. The first three unite with Ayr and Irvine in returning one member to parliament; the county returns another. Pop. (1831) 100,973; (1881) 76,440, of whom 46,503 were Gaelic-speaking. The decrease is chiefly due to emigration. The principal proprietors are the Duke of Argyll and the Earl of Breadalbane. Among the antiquities of Argyllshire are the ecclesiastical ruins of Iona and Oronsay, and the castles of Dunstaffnage, Dunolly, and Kilchurn. See Lord Archibald Campbell's *Records of Argyll* (Edin. 1886).

Argyrokastron (the Turkish *Ergeri*), a town of Albania, in the province of Janina, near the Dryno, an affluent of the Viosa. It contains the ruins of an imposing castellated fort. In 1814 the town was almost depopulated by the plague, and the population has never since exceeded 5000, being now about 4000.

Argyropoulos, (1) JOANNES, one of the earliest teachers of Greek learning in the West, born at Constantinople in 1416, settled finally in Italy after the fall of his native city in 1453. He taught first at Florence, and here among his pupils were the son and grandson of Cosmo de' Medici; but on the outbreak of the plague in 1471 he repaired to Rome, and there he died, probably in 1486. From his school came many learned men, among them Poliziano and Reuchlin.—(2) PERIKLES, a Greek publicist, born September 17, 1809, at Constantinople, became professor of Jurisprudence at Athens in 1837, and soon made himself more notable than popular with the court party as a promoter of constitutional state reform in Greece, especially through his journal *Anamorphosis*. Elected to the Chamber in 1843, he was foreign minister from May 1854

to September 1855, when he returned to his academic chair. He died December 22, 1860.

Aria (Ital. 'air'), in Music, a rhythmical melody, as distinct from recitative. The term was formerly applied to a measured lyrical piece either for one or several voices; but is now commonly applied to a song introduced in a cantata, oratorio, or opera, and intended for one voice supported by instruments. The 'aria grande' has taken many forms, mostly of two classes—the aria with 'da capo,' in which the first section is repeated *in extenso* after the second or intermediary one, and the aria without 'da capo,' a more varied and extended form, in which the first section may be several times repeated, and the last time generally more or less expanded into a coda. The great masters have raised it to almost symphonic importance—e.g. Beethoven's 'Ah perfido,' or Mendelssohn's 'Infelice.'—**ARIETTA** is a short melody.

Ariadne, daughter of Minos of Crete and Pasiphaë. She fell in love with Theseus when he came to Crete with the annual tribute of the Athenians for the Minotaur, and gave him a sword with which to slay the monster, and a clew by means of which to find his way out of the Labyrinth. For this service Theseus promised to marry her, and she escaped with him, but was slain by Artemis on the island of Naxos. Such is the account of Homer, but according to a more common tradition, she was deserted by Theseus at Naxos, where she was found by Dionysus returning from his triumph in India. The youthful god was captivated by her beauty, and married her. At her death he gave her a place among the gods, and hung her wedding-crown as a constellation in the sky. Ariadne, as left forsaken by Theseus and found by Dionysus, has been a favourite subject for works of art.

Aria'no (*Arianum*), a city of South Italy, in the province of Avellino, beautifully situated 2900 feet above the sea, in one of the most frequented passes of the Apennines, 84 miles N.E. of Naples by rail. It has a fine cathedral. Pop. (1881) 12,522.

Arians. See **ARIUS**.

Arias Montanus, BENEDICTUS, a Catholic divine and learned orientalist, was born in 1527, in the south Estremadura. He studied at Seville and Alcalá, and became a Benedictine. He was present at the celebrated Council of Trent; and in 1568 was sent by Philip II. to Antwerp, to superintend the publication of the famous edition of the Antwerp Polyglot Bible (8 vols. folio, 1569-72). He became librarian at the Escorial, and died in 1598.

Arica, a seaport of Tacna, the most southerly department of Peru. It is one of the chief outlets of the trade of Bolivia, and has been connected since 1854 by rail with Tacna, 38 miles inland. Its exports mostly consist of copper, silver, cascarilla and other barks, chinchilla skins, alpaca, and vicuña wool. Arica has frequently suffered from earthquakes. It was almost wholly destroyed in 1832, but soon rebuilt. It suffered severely again in 1868, the earthquake being succeeded by fearful waves, one of them 40 feet high. In the time of the Spanish supremacy, Arica was a great commercial city with 30,000 inhabitants; its present pop. is about 4000. It was stormed and taken by the Chilians in 1880. The treaty of 1883 provided that Arica and the department of Tacna were to be occupied by Chili for ten years.

Arichat, a seaport on the south side of Isle Madame, in the province of Nova Scotia, with a harbour for the largest vessels. It is the see of a Roman Catholic bishop. Pop. about 1000, largely engaged in fishing.

Ariège, a department in the south of France, lying along the northern slopes of the Pyrenees. It contains some of the highest mountain-summits in France, such as Montcalm, 10,513 feet, and Estats, 10,800 feet; but is comparatively level towards the north, where the climate is milder than amongst the hills. There are extensive forests; iron, coal, and other minerals are wrought, and there are cloth manufactures. Area, 1890 sq. m. Pop. (1886) 237,619.—The river Ariège rises in the Pyrenees, and after a course of 93 miles, falls into the Garonne near Toulouse.

Ariel, a man's name in the Old Testament, applied also to the city of Jerusalem by Isaiah. Gesenius, Ewald, and Fürst explain the word as 'lion of God,' but most of the ancient Jewish expositors as 'hearth of God.' In later demonology, it means a water-spirit. Thomas Heywood and Milton apply it to an angel. The literary currency of the name is due to Shakespeare's use of it in his *Tempest* as a name for a particular spirit of the air. At first in the service of the witch Sycorax, mother of Caliban, for his disobedience he is shut up by his mistress in the heart of a pine-tree. Prospero frees him after his imprisonment has lasted twelve years, uses his aid to raise storms, then lets him free into his native element.

Aries, the Ram, one of the signs of the zodiac, including the first 30 degrees of the ecliptic measured from the vernal equinox, or that point where the vernal passage of the sun across the equator takes place. The vernal equinox, or, as it is also called, the first point of Aries, is constantly changing its position among the fixed stars, in consequence of the Precession (q.v.) of the equinoxes. Hence the sign Aries no longer corresponds with the constellation Aries, which was the case about two thousand years ago. The present sign Aries is in the constellation Pisces, about 30° west of the original sign. See ZODIAC.

Ar'il (*arillus*), a peculiar covering of the seed in some plants, formed by an expansion of the *funiculus* (the cord which attaches the ovule to the *placenta*). This expansion takes place after fertilisation, and sometimes invests the seed entirely, sometimes only partially. The succulent red cup round the seed of the yew is a familiar example, and the white water-lily, the passion flower, and the willow also form characteristic arils. Another accessory covering, often called the arillode, is developed from the edges of the *micropyle* (the aperture by which the pollen tube enters the ovule). This in the nutmeg forms what is called *mace*. In the spindle-tree (*Euonymus europæus*), it forms the remarkable orange-coloured covering of the seed. See OVULE.

Arimaspi, a fabulous people, supposed by the ancient Greeks to inhabit the most northern region of the world, near the Rhipæi Montes, which Ptolemy places on the site of the modern Ural Mountains. They are described by Herodotus in the fourth book of his History, as one-eyed and fierce, engaged in perpetual conflict with the neighbouring griffins for the gold hoarded by them.

Arin'os, a river in the south-west of Brazil, which, after a north-west course of 700 miles, joins the Tapajos, itself an affluent of the Amazon.

Ari'ón, a celebrated lute-player of Methymna in Lesbos, about 800 B.C., regarded by the ancients as the inventor of the dithyrambic metre. Having fallen among robbers in returning to Corinth from Tarentum, where he had won the prize in a poetical contest, he threw himself into the sea after playing on his lute. A dolphin, charmed by his music, carried him on his back safely to shore. The lute and dolphin were placed among the constellations; and the story became a favourite theme with artists.

Ariosto, LUDOVICO, one of the greatest of Italian poets, was born at Reggio, September 8, 1474, being the eldest son of the military governor of that city. He was bred to the law, but abandoned it for poetry. However, at an early period of life, he was compelled to exert himself for the support of a large family, left as a burden on him at the death of his father. His imaginative powers were developed in early life. In 1503, after he had written two comedies, with several lyrical poems in Latin and Italian, he was introduced to the court of the Cardinal Ippolyto d'Este, who employed him in many negotiations, but was extremely niggardly in his rewards. Here, in Ferrara, in the space of about ten years, Ariosto produced his great poem, *Orlando Furioso*, which was published in that city in 1516, in forty cantos. After the death of the cardinal, the duke, his brother, invited the poet to his service, and acted to him with comparative kindness and liberality. In 1521 a second edition of his poems was published, the *Orlando Furioso* being still in forty cantos. Shortly after, he was commissioned by the duke to suppress an insurrection which had broken out in the wild mountain-district of Garfagnana; a task which seems more like a punishment than a mark of honour. Ariosto, however, succeeded in this arduous undertaking; and after remaining three years governor of the province, he returned to Ferrara, where he lived comfortably, nominally in the service of his patron, but in reality enjoying what he highly prized—an abundant leisure for prosecuting his studies. It was at this time that he composed his comedies, and gave the finishing touch to his *Orlando*. At length, in 1532, that poem made its appearance in a third edition, enlarged to its present dimensions of forty-six cantos. He now became seriously ill of a painful internal distemper, of which, after a few months of suffering, he died on 6th June 1533, in his 59th year. He was buried in the church of San Benedetto, at Ferrara, where a magnificent monument marks his resting-place. Ariosto is described in the Latin verses of his brother Gabrielle as a man of noble personal appearance and amiable character. His *Orlando Furioso* is a romantic, imaginative epic, marked by great vivacity, playfulness of fancy, and ingenuity in the linking together of the several episodes. It takes its name and its theme from a chivalrous romantic poem by Boiardo (q.v.), the *Orlando Innamorato*. That poem treats of the wars between Charlemagne and the Saracens, confounded as they were by tradition with those of Charles Martel, wherein Orlando, or Roland (q.v.), stood forward as the champion of Christendom. Orlando is the hero of Boiardo's piece, and falls in love with Angelica, a clever and beautiful oriental princess, sent by the Paynim to sow discord among the knights of the Christian armies. The story being left unfinished in the *Orlando Innamorato*, is taken up by Ariosto, who makes the lady fall in love with an obscure squire Medoro, on which Orlando gets frenzied, and long continues in a state of insanity. Besides his great work, Ariosto wrote comedies, satires, sonnets, and a number of Latin poems. Of these, the sonnets alone show signs of the genius of Ariosto. His Latin poems are mediocre indeed, and his comedies, besides lacking interest, are disfigured by repeated immoral and licentious passages. Only the elegance of the diction, in which Ariosto always excels, and the spirited dialogue, serve to stamp their origin. In 1845 there was discovered the mutilated manuscript of a second epic, *Rinaldo Ardito*, describing, like the *Orlando*, the battles of Charlemagne and his paladins. It was ascribed to Ariosto, but its genuineness is at least doubtful. Of the *Orlando* there are many English translations: by Harrington (1607 and 1634), Crocker

(1755), Huggins (1757), Hoole (1783), and Stewart Rose (1823). In the last only is there to be found a fair representation of the feeling and spirit of the original. One of Ariosto's comedies had been rendered into English by Gascoigne as early as the year 1566. A list of the hundred and more editions of the *Orlando*, and of the various lives of its author, will be found in Ferrazzi's *Bibliografia Ariostesca* (Bassano, 1881).

Ariovistus, a German chief who crossed the Rhine to help the Sequani in their struggle with the Ædui. Having gained a victory for the Sequani, he appropriated part of their territory, and soon swarms of Germans followed him into Gaul. The Sequani now joined the Ædui in imploring the help of Cæsar, who advanced to meet the Germans, and defeated them in a furious engagement, fought near Vesontium (Besançon), 58 B.C. Ariovistus, with only a few followers, escaped over the Rhine, and his subsequent history is unknown.

Aris'ta and Aris'tate. See AWN.

Aristæus, an ancient divinity whose worship in the earliest times was widely diffused throughout Greece, but whose myth is remarkably obscure. According to the common tradition, he was the son of Apollo and the nymph Cyrene, and was born near Cyrene, in Africa. Hermes placed the child under the protection of the Horæ, or of Chiron the Centaur. After Aristæus left Libya, he went to Thebes, in Bœotia, where he was taught by the muses the arts of healing and prophecy, and where he married Autonoe, the daughter of Cadmus, by whom he had several children, including Actæon (q.v.). At Ceos, he liberated the inhabitants from the miseries of a destructive drought. He visited the islands of the Ægean Sea, Sicily, Sardinia, and Magna Græcia, leaving everywhere traces of his divine benignity. In Thrace, he was initiated in the mysteries of Dionysus; and he disappeared from the earth near Mount Hæmus. Aristæus, always a beneficent deity, was especially worshipped as the protector of vine and olive plantations, and of hunters and herdsmen. The great diversities in the legend were probably caused by the fusion into one of separate but similar local divinities.

Aristarchus (1) OF SAMOS, a celebrated ancient astronomer, of the Alexandrian school, who flourished 280-264 B.C. He seems certainly to have anticipated Copernicus, maintaining that the earth moves round the sun. For this we have the testimony of Archimedes: he was even accused of impiety on this account. All his writings have perished, excepting a short essay on the sizes and distances of the sun and the moon (ed. by Wallis, Oxford, 1688). In this he shows the method of estimating the relative distances of the sun and the moon from the earth, by the angle formed by the two bodies at the observer's eye at that moment when the moon is exactly half-luminous. The principle was accurate in theory; but the angle to be measured was too small, and the available instruments too imperfect to give accurate results.—(2) OF SAMOTHRACE, a very famous grammarian and critic, who flourished about 160 B.C. in Alexandria, where he educated the children of Ptolemy Philopator, and superintended the great library. His life was chiefly devoted to the elucidation and restoration of the text of the Greek poets—Pindar, the tragedians, and others, but especially Homer. The form in which we now have the Homeric poems preserved is in great measure owing to his judgment and industry. The strictness of his critical principles has made his name a proverbial expression for a severely just and judicious critic. He is said to have written 800 treatises, and founded a school of critics, some of whom have preserved fragments of

his works. To escape the tyranny of his old pupil, Ptolemy VII. Physkon, he fled to Cyprus, where he died at the age of 72, of voluntary starvation on account of an incurable dropsy. See Ludwich's *Aristarchs Homerische Textkritik* (Leip. 1884).

Aristides, surnamed 'THE JUST,' belonged to a good old Athenian family, and at the battle of Marathon (490 B.C.) was one of the ten leaders. Each of these was to hold the supreme command for one day; but Aristides, who saw the folly of the system, induced his companions to give up their claims, and make Miltiades commander-in-chief. Next year, Aristides was chief archon, and in this office, as in every other, secured the general respect of the citizens. About 483 the jealousy of his great rival Themistocles procured the banishment of Aristides. It is said that when an illiterate citizen, who did not know him personally, requested him to write his own name on the voting shell, he asked the man whether Aristides had injured him. 'No,' said the voter; 'but I am weary of hearing him always styled "the Just."' Aristides submitted to the sentence with dignity, praying the gods, as he left the city, that the Athenians might not have cause to repent of their decision. Only three years later came Xerxes' overwhelming invasion. On the eve of the battle of Salamis, Aristides, hearing that the Greek fleet was hemmed in by that of the Persians, made his way from Ægina to offer his aid to Themistocles. He did good service in that great sea-fight; and, as Athenian general, he divided with Pausanias the glory of Platea (479). In 477 B.C. he introduced a sweeping change into the constitution, by which all citizens, without distinction of rank, were admitted to the archonship. Through him, too, about the same time, Athens, not Sparta, became the ruling state of a maritime confederacy. He was an old man when he died (most likely in 468), and so poor, it is said, that he had to be buried at the public cost. He left a son and two daughters, for whom provision was made by the state. See Vom Berg, *Das Leben des Aristides* (Gött. 1871).

Aristip'pus, the founder of the Cyrenaic school of philosophy among the Greeks, was a native of Cyrene, in Africa. Having come into contact with Socrates on a visit to Athens, he became one of his pupils, and remained with the master almost up to his death, 399 B.C. He taught philosophy both at Athens and Ægina, and was the first of the pupils of Socrates to take money for his instruction. Aristippus passed a considerable part of his life in Syracuse, at the court of Dionysius, the tyrant, where he acquired the reputation of an elegant philosophic voluptuary. Plato says Aristippus was the only man he knew who could wear with equal grace both fine clothes and rags. Diogenes Laertius records a number of his sayings, which reveal a sharp, lively, and self-complacent nature. He lived some time at Corinth, in intimacy with the famous Lais, but towards the close of his life he is supposed to have retired to Cyrene. He taught his leading doctrines to his daughter Arete, by whom they were communicated to her son Aristippus the Younger. The latter is supposed first to have systematised them, as it is more than probable that Aristippus published nothing during his life. He prided himself more upon spending his days in what he conceived to be a philosophical manner, than in elaborating a philosophical system for the benefit of mankind.

The Cyrenaic school, who carried out the doctrines of Aristippus to their legitimate conclusions, professed a great contempt for speculative philosophy and for physical and mathematical knowledge. They confined their investigations to morals, and formed an ethical system completely in harmony

with the gay, self-possessed, worldly, and sceptical character of their master. Its chief points were: (1) that all human sensations are either pleasurable or painful, and that pleasure and pain are the only criterions of good and evil; (2) that pleasure consists in a gentle, and pain in a violent motion of the soul; (3) that happiness is simply the result of a continuous series of pleasurable sensations; (4) that actions are in themselves morally indifferent, and that men are concerned only with their results. The great philosophic sensualist stood out in strong relief against the gloom and austerity of Antisthenes and the Cynic school. The doctrine that makes pleasure the chief good is often called *Hedonism* (from Gr. *hedonē*, 'pleasure').

Aristobulus, an Alexandrian Jew and peripatetic philosopher, who lived about 170 B.C., was considered by the early fathers as the founder of the Jewish philosophy in Alexandria. He is said to have been the author of an allegorical commentary on the books of Moses, which showed that the oldest Greek writers borrowed from the Hebrew Scriptures; but it is now admitted that this work was written by a much later writer.—For the Hasmonean or Maccabee princes of this name, in 106 B.C. and 64 B.C. respectively, see **JEWS**.

Aristocracy (Gr. *aristokratia*, from *aristos*, 'best,' and *kratos*, 'power') means etymologically the power or government of the best men. As used by Plato and Aristotle, it meant the government of a class, whose supremacy rested not on wealth alone, but on character and personal distinction. In point of fact, that class was a privileged one, consisting of the leading families, in which wealth and good-breeding were hereditary, and which long experience had trained to a habit of command. In an aristocracy, it was implied that the government of affairs should be for the public good, and not in a class interest. Oligarchy was a degenerate phase of aristocracy, in which the rule of the minority was founded on wealth, and conducted in its own narrow interests. Almost all countries have passed through a stage in which government has been in the hands of a privileged class, which may be called an aristocracy (when the class is markedly small in numbers, and narrow in spirit and policy, such rule is generally called an oligarchy). So it was in ancient Rome, and in the Italian states of the middle ages. In most of the European states, noble families have been powerful, at certain periods co-ordinate with the royal power, and even effacing it. The absolute states of modern times were based on the subordination of the noble families to the royal power. The king and aristocracy more recently combined to resist liberalism or constitutionalism. In modern English history, especially after the revolution of 1688, the government was really an aristocratic one for about a century and a half. That is to say, for that period the ruling power consisted of the noble families, only very partially controlled by the king, and only to a slight degree limited by the industrial class. The aristocratic element is still an influential one in the government of European countries. It is probably strongest in Prussia and weakest in France. See **DEMOCRACY**, **GOVERNMENT**.

Aristogel'ton. See **HARMODIUS**.

Aristolochia, a genus belonging to the dictyodendrous order Aristolochiaceae, which includes a large number of herbs and shrubs, frequently climbers, and which is specially abundant in tropical South America. Its affinities are obscure, owing to the peculiarly aberrant structure of its flowers: the tubular oblique perianth, dilated at its base, and the stamens adherent to the stigmas, are especially remarkable, and these characters are

associated with a no less peculiar mode of fertilisation. The fertilising insects (usually small flies) attracted by the expanded and coloured lip of the perianth, as well as by the frequently powerful and fetid odour, descend the narrowed perianth tube into the dilated base. Thence they are prevented from returning by the downward-directed hairs, with which the perianth tube is lined; these, however, wither when the stamens are fully matured, and the flies escape, dusted with pollen,

Aristolochia clematitis:
a, flower on larger scale; b, section of flower.

to enter another flower, and there become again imprisoned until after they have had abundant time to fertilise the stigmas, and acquire a new load of pollen in their efforts to escape. Several species of *Aristolochia* are found in the south of Europe; one only, the common Birthwort (*A. clematitis*), occurs upon the Continent as far north as about lat. 50°, and is a doubtful native of England. The order is, however, also represented in Britain by *Asarum europaeum*, or *Asarabacca* (q.v.). It has a long branching root, with an unpleasant taste and smell, which, with the roots of *A. rotunda* and *A. longa*, two herbaceous species, natives of the south of Europe, was formerly much used in medicine, being regarded as of great service in cases of difficult parturition, whence the name (Gr. *aristos*, 'best,' and *locheia*, 'childbirth'). These roots possess powerful stimulating properties, and those of the southern species are still used as emmenagogues. The root of *A. indica* is used in the same way by the Hindus.—*A. serpentaria*, Virginian Snakeroot, is a native of most parts of the United States, growing in woods. The root has long been a fancied remedy for the bite of the rattlesnake. It possesses stimulant and tonic properties.—Its reputation as a cure for serpent-bites is shared by other species, particularly *A. anguicida* and *A. guaco* (the Guaco of Colombia), natives of the warmer parts of America; and it is said that a number of species are used by Egyptian jugglers, in order to their handling serpents with impunity.—Several South American species seem also to possess medicinal properties analogous to those of the Virginian Snakeroot.—*A. Siphon*, a climbing shrub, of 15 to 20 feet in height, a native of the southern parts of the Alleghany Mountains, is frequently planted to form shady bowers, on account of its very large heart-shaped leaves (a foot in breadth), of a beautiful green. From the

bowl-shaped base of its perianth, the plant has also received the name of Pipe-shrub, Pipe-vine, or Dutchman's Pipe.—Tropical species are distinguished for their beauty and the peculiar forms of their flowers, and are frequently cultivated in our hot-houses.

Aristophanes, the greatest of Attic, if not of all, comedians, was born about 448 B.C. His father held property in Ægina, which explains the poet's allusion (*Acharnians*) to the claim of that island by the Spartans, in order to secure him, and also his prosecution by Cleon on the charge of usurping civic rights. Of his personal history we have nothing recorded, except his deme and tribe, and that he had three sons—Philippos, Ararōs, and Nikostratos—all comic poets. The old comedy, of which Aristophanes is to us the representative, exercised an influence akin to that of the public press of our day in pamphlets and newspaper articles; it claimed to be guardian and censor of public morals, and the critic of current events. During the sixty years in which it flourished under the Athenian democracy, its distinctive feature was its plain-spoken and personal character. Full license for riotous fun and banter was given it by the season of its exhibition—viz. the Dionysiac festival. Its shafts were chiefly aimed at radical tendencies and novelties of any kind. Its plots were political burlesques; its famous *parabases* were addresses of the chorus to the audience, explaining its views on subjects of the moment—somewhat like the topical song in our pantomimes. Aristophanes is said to have written fifty-four plays, but eleven only are extant, which may be ranged under the categories of political, philosophical, social, and literary; and again under three periods, ending respectively 425, 406, and 388 B.C., about which last date he died. To the first period belong (1) the *Acharnians*, (2) the *Knights*, (3) the *Clouds*, (4) the *Wasps*, the poet's four masterpieces, named from their respective choruses, and (5) the *Peace*, in all of which full rein is given to political satire. To the second, (6) the *Birds*, (7) the *Lysistrata*, (8) the *Thesmophoriazuse*, (9) the *Frogs*, in which we find less political rancour, and more reticence and caution. To the third, the *Ecclesiazuse* and *Plutus*, comedies of a tamer type, known as that of the middle comedy, in which political allusions and the distinctive characteristic of the old comedy, the *parabasis*, disappear.

Aristophanes made his debut with the *Revellers* (427 B.C.), in which the teaching of the Sophists, then becoming fashionable, is contrasted with the simplicity of the old education. It was followed by the *Babylonians*, a satire on the various magistracies in Athens, which contained incidentally a preliminary attack on Cleon, one of his *bêtes noires*, to which the poet alludes in his next year's play, the *Acharnians* (425 B.C., the seventh year of the Peloponnesian war). This was brought out, as were also the other two, in the name of Kallistratos. In this, the first of his eleven extant plays, Aristophanes pleads the cause of the aristocratic peace-party against the democratic war-party, whose selfish aims and place-hunting, disguised under the cloak of patriotism, he exposes with unsparing ridicule. Dikaiopolis, an honest farmer, concludes a peace for thirty years between himself and family on the one side, and the Spartans and their allies on the other, and keeps the rural Dionysia after six years' interval. The old charcoal-burners of Acharnai, who will not hear of peace, because their lands have been ruined by the Spartan invasion, attack him; but he pleads the enemy's cause, and converts half the chorus to his view, while the malcontent half fetch the swash-buckler general Lamachos to overawe the traitor. Dikaiopolis holds open market with the sworn enemies of

Athens, and enjoys himself in the midst of his good cheer, while Lamachos is depicted in piteous flight and mortal pain, after the hardships of campaigning.

The *Knights* (424 B.C.) was the first play produced in the poet's own name. It is aimed entirely at Cleon the tanner, the most prominent demagogue of the day, whose success at Pylas was a bitter disappointment to his opponents. Dēmos, the Athenian John Bull, is a cross, dull-witted, and superstitious old man, who has intrusted the management of his household to a bullying Paphlagonian slave (Cleon). Two of his fellow-slaves (Demosthenes and Nicias) conspire against his tyranny, with the Knights, who represent the richer classes of Athens, and contrive that he shall be supplanted by a sausage-seller. Dēmos is then renovated by being boiled, and becomes youthful and sensible once more.

The *Clouds* (423 B.C.) is a protest against the growing spirit of scepticism at Athens, where it was becoming the fashion for youths to frequent the new schools of the Sophists. To the conservative instincts of Aristophanes this was bitter gall, and he ridiculed the whole profession with Socrates at their head. The latter, by his ungainly personality and eccentric habits, was a good subject for caricature; but Aristophanes' picture is no truthful portrait of the great philosopher, one of whose chief aims and merits was to expose shams.

Strepsiades is being ruined by his spendthrift son Pheidippides (Alcibiades). His only chance of safety is to send his son to the 'Phrontistery' or *Pensoir* of Socrates, where he will learn to make the worse appear the better reason, which his creditors unfortunately hold. The son bluntly refusing, the father goes himself, but proves too stupid and forgetful to learn; so the son reluctantly enters the school, and learns the worse reason with a vengeance. In the famous dialogue between the Just and the Unjust Argument, the latter wins the day, and so obtains the control of the pupil, who is imbued with the new ideas so thoroughly, that, at a feast given him by his father on his return home, he sings an immoral speech from Euripides, beats his father, and justifies the act by his newly learned sophistry. The eyes of the old man are opened, and he wreaks his vengeance on Socrates by setting the *Pensoir* and its inmates on fire.

The *Clouds* is unequalled in ancient comedy for simplicity and perfection of plot, and morality of tone. It is the nearest approach to a modern French play; it exhibits the development of a possible action and real characters, and not merely a string of comic situations. In repartee it is not excelled by any play of Molière, and Shakespeare at his best shows no richer humour.

The *Wasps* (422 B.C.), of which Racine's one comedy *Les Plaideurs* is an imitation, is a counterpart of the *Clouds*, in which a father converts his son, while in the *Wasps* a son reforms his father. The two principal characters are Philocleon, an old dikast, and his son Bdelycleon, who tries to cure his father of his mania for sitting in the court, and gets up for him a mock trial of a dog at home. In the latter half of the play, the vulgar element predominates; it represents Philocleon's conversion to the ways of society, but he behaves unexpectedly with more than the license of youth.

The *Peace* (421 B.C.) may be called a leading article in favour of the Peace of Nicias, when both Cleon and Brasidas were dead. The first half of the play represents the recovery of Peace from heaven, whither Trygæos had gone on a beetle's back to fetch her; the second, the social enjoyments which welcome her restoration to the earth. Its hearty humour, its beautiful descriptions of rural life and its pleasures, are inimitable.

The *Birds* (414 B.C.) is a brilliant pantomime. Its aim is vague if looked on as a satire. It was composed at a period of great excitement, when Athens was in the fever-heat of preparation for the Sicilian expedition, and Alcibiades was in every mouth, but it was not produced until eight months afterwards. Peithetairos (Alcibiades) and his friend Euelpides start a scheme for making the birds build a city (Cloud-cuckoo-town) in mid-air, and establish their sovereignty, so as to shut off the gods, and intercept men's offerings to them. The gods submit and allow Basileia, daughter of Zeus, to be married to Peithetairos.

The *Lysistrata*, or 'Strike of the Wives' (411 B.C.), exhibits the women of all Greece taking the question of war into their own hands, and refusing their lords their rights until they consent to make peace.

The *Thesmophoriazuse*, the most diverting of all Aristophanes' plays, was brought out three months later. It contains an attack on the morality of Athenian women and on Euripides; it does not interfere in politics.

The *Frogs* (405 B.C.) is a literary criticism. The first part contains the adventures of Dionysos on his journey to Hades in search of a good poet, Sophocles and Euripides being just dead; the second, the poetical contest between Æschylus and Euripides, and the victory of the former.

In the *Ecclesiazuse* (393 B.C.), or 'Ladies in Parliament,' Aristophanes satirises the communistic theories which were afloat, by making the women occupy the Pnyx, disguised as men, and decree a new constitution with full community of property and wives. The play is remarkable for its witty repartee.

The *Plutus* (388 B.C.) is unique among Aristophanes' plays. It is a satire on humanity; its subject, the unjust distribution of wealth, the cause of which is the blindness of Plutus. His sight is restored to him by Asklepios, and then matters are righted; the god bestows his favours only on the deserving, to the ruin of many evil trades.

The choruses are the part of his work on which Aristophanes lavished the greatest wealth of his exuberant fancy. A study of these will give an idea of the varied resources of his genius, passing with prodigious fullness of the most comical fancies to the most charming descriptions, such as recall the idyllic grace of Theocritus, and to the most sublime conceptions.

The first printed edition of Aristophanes was the Aldine (Venice, 1498); it contains nine plays. Junta (1515) added two. Other editions are those of Bergler (1760), Brunck (1783), Invernizzi-Beck (1794), containing a collation of the Ravenna or oldest MS., Bekker (1829), Dindorf (*Poeta Scenici*, 5th ed. 1869), Bergk (1857), Meineke (1860), Blaydes (1886), Holden (5th ed. 1887). There are translations of single plays by Mitchell (1822), J. H. Frere, Walsh (1837), B. B. Rogers, B. H. Kennedy, R. Y. Tyrrell (1883).

Aristotelia. See MAQUI.

Aristotle was born at Stagira (Stageira), a Greek colony on the Macedonian peninsula Chalcidice, in the year 384 B.C. He belonged to a family in which the practice of physic was hereditary. His father, Nicomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip, and grandfather of Alexander the Great. Aristotle lost both parents while he was quite young, and was brought up under the care of Proxenus, a citizen of Atarneus, in Asia Minor, who was then settled at Stagira. It is to be conjectured that his education would take the direction of preparing him for the family profession. In after-life, he occupied himself largely in the dissecting of animals, and was acquainted with all

the facts that had been derived from this source by others before him. It seems probable, however, that he early abandoned the intention of following physic as a profession, and aspired to that cultivation of universal knowledge for its own sake, in which he attained a distinction without parallel in the history of the human race.

In his 18th year (367 B.C.) he left Stagira for Athens, then the intellectual centre of Greece and of the civilised world. Plato, on whom he doubtless had his eye as his chief instructor, was then absent at Syracuse in that extraordinary episode of his life, connecting him as political adviser with the two successive Syracusan despots—Dionysius the Elder, and Dionysius the Younger—and with Dion. Aristotle, therefore, pursued his studies by books, and by the help of any other masters he could find, during the first three years of his stay. On the return of Plato, he became his pupil, and soon made his master aware of the remarkable penetration and reach of his intellect. We are told that Plato spoke of Aristotle as the 'intellect of the school.' Unfortunately, there is a total absence of precise information as to the early studies of the rising philosopher. He remained at Athens twenty years, during which the only facts recorded, in addition to his studying with Plato, are, that he set up a class of rhetoric, and that in so doing, he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens got the principal part of their education for public life. They learned the art of speaking before the Dikasteries, or courts of law, and the public assembly, with efficiency and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that Aristotle would look with contempt upon the shallowness—in all that regarded thought or subject matter—of the common rhetorical teaching, of which, doubtless, the prevailing excellence would lie in the form of the address, being artistic rather than profound or erudite. One of the disciples of Isocrates, defending his master against Aristotle, wrote a treatise wherein allusion is made to a work (now lost) on proverbs, the first recorded publication of the philosopher.

The death of Plato (347 B.C.) was the occasion of Aristotle's departure from Athens. It was not extraordinary or unreasonable that Aristotle should hope to succeed his master as the chief of his school, named the Academy. We now know that no other man then existing had an equal title to that pre-eminence. Plato, however, left his nephew Speusippus as his successor. We may suppose the disappointment thus arising to have been the principal circumstance that determined Aristotle to stay no longer in Athens; but there are also other reasons that may be assigned, arising out of his relations with the Macedonian royal family at a time when the Athenians and Philip had come into open enmity.

Whatever may be the explanation, he went in his thirty-seventh year, after a stay of nearly twenty years in Athens, to the Mysian town of Atarneus, opposite to the island of Lesbos. Here he lived with Hermeias, the despot of the town, a man of singular energy and ability, who had conquered his dominion for himself from the Persians, at that time masters of nearly all Asia Minor. Aristotle had taught him rhetoric at Athens, and he became in return the attached friend and admirer of his teacher. For three years the two lived together in the stronghold of Atarneus until the death of Hermeias at the hands of a treacherous enemy. Aristotle took refuge in

Mitylene, the chief city of Lesbos, taking with him Pythias, the sister or niece of Hermeias, whom he made his wife. In a noble ode he has commemorated the merits of his lost friend. His wife, Pythias, died a few years afterwards in Macedonia, leaving him a daughter of the same name. His son, Nicomachus—whose name, for whatever reason, has been given to the chief of the ethical writings that have come down to us among the works of Aristotle, the *Nicomachean Ethics*—was born to him at a later period of his life by a concubine.

After two years' stay at Mitylene, he was invited (in the year 342 B.C., age 42) by Philip to Macedonia, to educate his son Alexander, a boy of thirteen, who for at least three years was the pupil of Aristotle. The two parted finally when Alexander set forth on his expedition into Asia (334 B.C.), and Aristotle came from Macedonia to Athens, having recommended to the future conqueror, as a companion in his campaigns, the philosopher Callisthenes, whom he had educated along with Alexander. Now at the age of 50, he entered on the final epoch of his life; he opened a school called the 'Lyceum,' from its proximity to the temple of Apollo Lyceus. His followers came to be called the *Peripatetics*, either from his practice of walking up and down in the garden during his lectures, or because the place was known as 'The Walk' (*Peripatos*). The tradition that it was his habit to give a morning lecture to select pupils on the more abstruse subjects, and one in the evening of a more popular kind to a general audience, is based upon a mistake. This crowning period of his life lasted twelve years. After the death of Alexander, the anti-Macedonian party at Athens obtained the ascendancy, and among other consequences, an accusation was prepared against Aristotle, the pretext being impiety. With the fate of Socrates before his eyes, he chose a timely escape, and in the beginning of 322 B.C., took refuge at Chalchis in Euboea, where, in the autumn of the same year, he died, aged 62. He had long been afflicted with indigestion, and ultimately sank under this malady.

Many of the details recorded of Aristotle's life, coming as they do from late and very uncritical authorities, must be considered uncertain; but the foregoing account may be accepted as in the main correct.

Of the numerous writings which have come down to us under the name of Aristotle, some are undoubtedly not his; some may be the products of his school, though not the direct work of the master himself. Even of his most famous and undisputed works, the structure is so irregular, and the style so unequal, that it has been with great probability supposed that they are to a large extent not finished writings, but notes and rough jottings edited by disciples, sometimes perhaps more reverent than judicious. There is indeed a story told by Strabo the geographer, who lived in the time of Augustus, that the works of Aristotle were first collected and edited by Andronicus of Rhodes (70 B.C.). How far this may account for the condition of 'our Aristotle' is a matter of dispute among scholars. We hear (e.g. from Cicero) of Dialogues written by Aristotle. Of these only a few unimportant fragments remain. They were probably written whilst he was still Plato's pupil. Those works which we possess all belong, apparently, to the last twelve years of his life (though the materials for them may have been collected previously), and it is therefore likely enough that many of them were left unfinished at his death. The commentaries written on some of these works by ancient scholars (e.g. Alexander of Aphrodisias, Themistius, Philoponus, Simplicius) during the early centuries of

the Christian era, form of themselves a great mass of literature.

In the middle ages, Aristotle's philosophy became known to the learned in the Western Church, at first mainly through Arabian translations, which in their turn were translated into Latin. The Arabian philosophy (of Avicenna, 1000 A.D., and Averroës, 1150 A.D.) was based upon Aristotle, with the addition of Neoplatonic elements. At the time when what was supposed to be the Aristotelian system was (especially through the influence of Thomas Aquinas, died 1274 A.D.) dominant in Western Europe, Aristotle's works were hardly known to any one in the original; nor could they have been appreciated in an unscientific age. The Aristotelianism which the medieval schoolmen admiringly followed, and which, at a later time, Bacon and others as blindly attacked, was very different in spirit from the real philosophy of Aristotle. For the history of Aristotelianism in the middle ages, see SCHOLASTICISM.

The method and system of Aristotle are frequently supposed to be in complete contrast to those of his master Plato. It is said 'Plato was an idealist, Aristotle an empiricist,' &c. This is misleading: the difference is great in appearance mainly; and this appearance is partly due to Aristotle's habit of criticising Plato very severely, though, on the whole, the relation between the two philosophers has been well expressed by Sir Alexander Grant's phrase that 'Aristotle codified Plato.' There is certainly a great difference in temperament between them, and a very great difference in literary manner. Plato was a poet, and is always an artist, as well as a thinker, in his Dialogues. Aristotle, with the education of a physician, has the mental habits and tendencies of the man of science predominant; and while lacking Plato's inspiration and enthusiasm, has a wider, in fact, an all-embracing range of interests, and cares more for actual facts for their own sake. He appears to have projected what may be called an Encyclopedia of Philosophy, though the scheme is only imperfectly carried out in his works.

Aristotle distinguishes three kinds of thinking: (1) Theoretic; (2) Practical; (3) Productive. Corresponding to these we have three divisions of Philosophy: (1) Theoretic Philosophy is subdivided into (a) First Philosophy or Theology; (b) Mathematics; (c) Physics—i.e. the Philosophy of Nature. (2) Practical Philosophy is subdivided into (a) Ethics; (b) Economics (i.e. the practical science of household management, to which *Chrematistic*, the science of wealth, is only a subordinate science); (c) Politics. (3) Poetic (Productive) Philosophy, corresponding to what we should call the Philosophy of Art, would apparently be subdivided according to the different arts (painting, sculpture, poetry), but Aristotle has not specially treated of any branch except poetry.

Logic, which Aristotle himself calls 'analytic,' does not form a division of philosophy, but is rather a study of the *method* of scientific proof (which aims at truth). The term 'logical' Aristotle applies specially to dialectical argument (which aims at refutation of opponents). Aristotle's followers held (in opposition to the Stoics, who divided all philosophy into logic, physics, ethics) that logic was not a part of philosophy, but its 'instrument' (*Organon*). Hence this name was given to the Aristotelian treatises on the subject. In the subsequent history of the science, the most influential of these treatises have been the *Categories* (containing the famous list of ten classes of predicates, substance, quality, quantity, &c.) and the *Prior Analytics* (containing the doctrine of syllogistic moods and figures); but for

the student of Aristotelian philosophy the most important is the *Posterior Analytics*, which contains his theory of knowledge and of scientific method. The defects which modern logicians have found in the Aristotelian logic are due mainly to the fact that the only science which in his day had reached a sufficiently advanced stage to have its method fairly analysed was the science of geometry. The analysis of its methods could hardly furnish an adequate account of the processes of reasoning in the less abstract sciences of nature. Formal deductive logic has hardly undergone any important modifications since Aristotle's time; but the so-called Aristotelian logicians have often had little enough of Aristotle's scientific spirit. Aristotle himself boasts with truth that in working out the theory of reasoning (*sylogism* is only the Greek term for 'reasoning' or 'inference') he had no predecessors.

In the *Rhetoric*, Aristotle deals with the art of persuasion. In this subject he had predecessors; but most subsequent treatises have added little to what he has said. This work, though usually classed along with the *Poetics*, since both deal with literature, may also be properly connected with the logical writings, the longest of which, the *Topics*, deals with dialectical argument and reasoning from probabilities.

The name *Metaphysics* (i.e. 'after the Physics') was given to Aristotle's discussions on 'first philosophy,' because they were placed by his editors *after* his books about nature. The work is in a very confused condition, and is in consequence extremely difficult. It begins with a sketch of preceding Greek philosophy, leading up to a criticism of Plato's doctrine of 'ideas' or universals. In opposition to Plato, Aristotle insists that reality is to be found only in individual things, each of which is a combination of *Form* (the universal element) and *Matter*; but his own doctrine, that knowledge can only be of universals, is the same as Plato's, though stripped of Plato's paradoxical modes of expression. His most important advance beyond Plato consists in his thoroughgoing application of the distinction of the *potential* and the *actual*. Actuality (realisation) and potentiality correspond to form and matter respectively, but the former terms are dynamical, the latter statical. All being he regards as a continuous ascending scale from mere matter (about which, because it is quite destitute of form, we can say nothing) up to the pure actuality, or 'thought thinking itself,' which he calls God. (Hence the name Theology also given to the 'first philosophy'—'first,' because it deals with the highest and ultimate problems of being.) Any individual object is intermediate between these two extremes, though at different stages—e.g. a block of marble is less formed, less actualised, than the statue made of it. In trying to understand or explain any individual object, we must consider it in four ways: (1) What are the material conditions of its existence? (2) What is its form or essential character as formed or realised? (3) Through what agency does it come into being? (4) What is the end or result attained by it? This is the famous doctrine of the 'Four Causes,' called respectively material, formal, efficient, final.

The books called the *Physics* deal mainly with what we should call the metaphysical aspects of movement (under which conception Aristotle includes growth and qualitative change), time, place, &c. Aristotle's application of his speculations about motion to a theory of the physical universe, exercised a bad influence (especially in the case of astronomy) on those whose admiration led them to accept his opinions as unquestionable dogmas.

The subject of mathematics he does not expressly treat himself, that science having already become sufficiently specialised and separated from the other departments of human thought. His works on Animals, though now possessing only an antiquarian interest, prove him to have been a close and acute observer of nature so far as, in the absence of all scientific aids to observation, his limited opportunities went; nor did he, as often alleged, neglect experiment, though doubtless not fully aware of its importance. Many modern biologists have been ready to bear testimony to the genuinely scientific character of his observations; and, indeed, his metaphysical theory provided him with an evolutionary conception of nature such as has only been recovered in recent times. His book *On the Soul* is as much a biological as a psychological treatise (for 'soul' means for him the vital principle in plants and animals, of which the thinking human soul is only the highest stage); yet in this treatise he may be regarded as the founder of psychology as a distinct science. In one of his shorter treatises, which deals with memory, he gave a first statement of the law of association of ideas.

His *Ethics* and *Politics*, though apparently less studied, at least less commented on, in antiquity than his other works, have in medieval and modern times exercised an enormous influence. Thus his conceptions of the various virtues and vices have, because of their adoption by St Thomas Aquinas and other medieval doctors, passed into European literature—e.g. in Dante, Spenser, &c. At the revival of letters, and at the Reformation, when antipathy to medieval theology caused a general disparagement of Aristotle's philosophy, Aristotle's *Politics* exercised a direct influence on the rise of modern political philosophy; it even helped to keep alive ideals of political liberty in an age when rulers were becoming more absolute and despotic. Aristotle is said to have made a collection of 158 'Constitutions,' as a preparation for writing his *Politics*. Only a few slight fragments of this collection are preserved. The *Economics* are not considered to be a work of Aristotle's own. His observations on the subject are to be found in Book I. of the *Politics*. In his remarks on *Chrematistic* (*Pol.* i. 8-11) are to be found the first germs of the science now called 'Political Economy.'

The *Poetics* is an incomplete work, and contains little more than a discussion of tragedy; but even so, few, if any, books on literary criticism have had more influence—and here, as elsewhere in the case of Aristotle, partly through misunderstandings. The famous doctrine of 'the three dramatic unities' is not in the *Poetics*. Only the unity of plot is insisted on by him.

The great edition of Aristotle is still that of Bekker, published by the Prussian Royal Academy (Berlin, 1831-40). Aristotle is now generally quoted by scholars according to the pages, columns, and lines of this edition. Bekker's text has been reprinted at Oxford (1837; 11 vols. 8vo). The Berlin edition also includes Latin translations, *Scholias* edited by Brandis, and a complete *Index* by Bonitz. The best edition of the ancient commentaries is that published at Berlin in 26 vols. There are excellent critical texts of some parts of Aristotle (*Eth.*, *Pol.*, *De An.*) published by Teubner, Leipzig. In Germany there has been a great succession of Aristotelian scholars, who have edited, translated, and expounded portions of his writings—e.g. Bonitz (ed. *Metaph.*), Schwegler (ed. and trans. *Metaph.*), Trendelenburg (ed. *De An.*), Torstrik (ed. *De An.*), Walz (ed. *Organon*), Susemihl (ed. and trans. *Politics*), &c. The French version of St Hilaire is readable, but untrustworthy. In English there is no good or even tolerable translation of all Aristotle. The *Nicomachean Ethics* has been edited with essays and commentary by Sir A. Grant, who also wrote the article 'Aristotle' in *Ency. Brit.*, 9th ed., and *Aristotle* in Black-

wood's series of *Ancient Classics for English Readers*: the best translation is by Peters. The *Politics* has been translated by Jowett (with introduction and notes) and by Welldon. The *Rhetoric* has been edited by Cope and translated by Welldon. The *Poetics* has been translated by Twining (printed in Donaldson's *Greek Theatre*) and by Wharton (Oxford 1883), edited with notes by Moore (Oxford, 1875). The *De Anima* has been translated and expounded by E. Wallace, who also wrote *Outlines of the Philosophy of Aristotle*. Poste's translation of *Post. Anal.* and edition of *Soph. Elench.*, and Dr Ogle's translation of *The Parts of Animals*, may also be named among the few good English works on Aristotle. For general accounts of Aristotle's philosophy, besides the writings of Grant and Wallace already mentioned, there are Grote's *Aristotle* (though only the *Organon* is treated in any detail), and Zeller's *Aristotle* (Eng. trans. 1888)—the latter indispensable to the student.

Aristotle's Lantern, the five-toothed masticating apparatus found round the beginning of the alimentary canal of some sea-urchins. The structure owes its name to its discoverer and its general shape. See SEA-URCHIN.

Aristoxenus of TARENTUM, a pupil of Aristotle, and one of the oldest writers upon music, flourished about 350 B.C. He was extraordinarily active and versatile in his literary studies, and is said to have composed 453 treatises on music, history, and philosophy. He founded a school of musicians, who judged of the notes in the diatonic scale by the ear, while the Pythagoreans determined them by certain numerical ratios. Except some fragments, we only possess his *Elements of Harmony* (ed. by Marquard, Berlin, 1869).

Arithmetic is the science that treats of numbers (Gr. *arithmos*). It is sometimes divided into theoretical and practical; the former investigating the properties of numbers and their combinations, the latter applying the principles so established, in the form of rules, to actual calculations. Some restrict the term arithmetic to this art of reckoning, assigning the investigation of the principles to analysis. Anciently the science of reckoning was usually called *logistic*; while arithmetic dealt with forms of numbers, primary numbers, &c.

Arithmetic is said to have been first developed into a science in India; the Egyptians reckoned the god Thoth the first teacher of numeration. Among the ancient Greeks and Romans, arithmetic made little progress, owing to their clumsy modes of notation. Few of their writings on the subject have come down to us; the most important are those of Euclid, Archimedes, Diophantus, and Nicomachus. After the introduction of the decimal system and the Arabic or Hindu numerals (see NUMERALS), about the 11th century, arithmetic began to assume a new form. Early in the 13th century, Sacro Bosco wrote his *Algorithmus seu Arithmetica Introductio*; Pacioli wrote in the 15th century; and in the 16th, Adam Riese and Apianus. It was not till the 16th century that the Double Rule of Three, or Compound Proportion, was discovered, and decimal fractions were introduced. The invention of Logarithms in the 17th century is the last great step in advance that the art has made. The elementary operations in Arithmetic are Addition, Subtraction, Multiplication, and Division. The subjects of Fractions, Decimals, Practice, Proportion, Logarithms, Interest, Discount, Square and Cube Root, will be noticed in their proper places. Annuities, Averages, Insurance, Mensuration, and Partnership give rise to branches or special applications of arithmetic. The various methods of Notation and the forms of the numerals employed by the Greeks, Romans, Chinese, and other nations, are separately treated at Notation and Numerals. The theory of Num-

bers (q.v.) is a subject cognate to arithmetic. See also ALGEBRA and ANALYSIS. Contrivances such as the Abacus, the Calculating Machine, and Napier's Bones, are treated under their own heads.

Arithmetical Mean is that number that lies equally distant between two others: thus, the arithmetical mean between 11 and 17 is 14, which is found by taking half their sum.

Arithmetical Progression is a series of numbers that increase or diminish by a common difference, as 7, 10, 13, 16, 19, 22; or, 12, 10½, 9, 7½, 6. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms. The series of natural numbers, 1, 2, 3, 4, &c. form an arithmetical progression, of which the difference is 1.

Arithmetical Signs are arbitrary marks or symbols used to denote the operations to be performed on numbers, or the relations existing between them. The sign of Addition is +; of Subtraction, -; of Multiplication, ×; of Division, ÷; of Equality, =. De Morgan, followed by Stokes and others, introduced for division the convenient symbol /; thus, 18/3 has the same meaning as 18 ÷ 3 or 1½. The same signs as in Arithmetic are also used in Algebra; and an enumeration and explanation of them may be found in almost any treatise on either subject.

Arius (Gr. *Areios*), the celebrated founder of Arianism, was a native of Libya, and is generally supposed to have been born shortly after the middle of the 3d century. About the year 306 A.D., Alexandria was thrown into confusion by the violence of its religious disputes, and in these Arius was largely concerned. At first, he took part with Meletius, Bishop of Lycopolis, in Upper Egypt, a man who was strenuously opposed to certain notions of discipline entertained by Peter, Bishop of Alexandria. He was excommunicated by Peter in consequence; but the latter dying soon after, Achillas, his successor, restored him to his office, and even advanced him to the dignity of a presbyter, 313. Arius was first brought into collision on a point of doctrine with his ecclesiastical superiors in 318. Alexander, the successor of Achillas, having in a public assembly of clergy, while speaking of the Trinity, said that it contained one single essence, or indivisible unity of substance, Arius alleged that such a conception was impossible to the human mind, and accused Alexander of Sabellianism—i.e. of destroying the distinction of persons. In maintaining his ground, Arius went beyond his first statement of the absolute distinctness of person between the Father and the Son; he maintained that the Son was not co-equal or co-eternal with the Father, but only the first and highest of all finite beings, created out of nothing by an act of God's free-will, and that he ought not to be ranked equal with the Father.

Arius was successful in securing the adherence of large numbers both of the clergy and laity in Egypt, Syria, and Asia Minor. In 321 a synod of bishops at Alexandria deposed and excommunicated him. To escape persecution, he retired to Palestine, whence he wrote a letter to his friend Eusebius, Bishop of Nicomedia. Eusebius warmly sympathised with him; wrote in his behalf to Paulinus, Bishop of Tyre, and others; absolved him from the Alexandrian synod's excommunication; and in 323 convened another synod in Bithynia, which pronounced favourably on Arius. While Arius was residing at Nicomedia, he wrote a theological work in verse and prose, called *Thaleia*, some fragments of which remain. The *Thaleia* is said to have been sung by the Arian neophytes, who thus kindled the passions of their adversaries, and increased the virulence of the contest. The

comedians, who were pagans, took advantage of the occasion to ridicule the Christian religion in the theatres.

It now became impossible for the Emperor Constantine to remain neutral or indifferent, and in order, as he thought, to effect a final settlement of the question, he convoked the memorable Council of Nicæa, or Nice (q.v.), in Bithynia, 325. Three hundred and eighteen bishops from almost all parts of the Christian world, but especially from the East, were present, besides numbers of priests, deacons, and acolytes. Arius boldly expounded and defended his opinions. He declared in the most unambiguous manner that the Son of God was created out of nothing; that he had not always existed; that he was not immutable or impeccable; that it was through his free-will he remained good and holy; that if he had chosen, he could as easily have sinned as not; in a word, that he was a mere creature and work of the Deity. He further affirmed that the Son of God was not of the same substance with the Father; that he was not the 'Word' or 'Wisdom,' properly speaking; and that the Scriptures only attribute these names to him as they do to other created intelligences. These propositions were listened to with great calmness by the bishops, but the inferior clergy, or at least a majority of them, manifested the most violent opposition. Alexander, Bishop of Constantinople, was ably seconded by the young deacon, Athanasius (q.v.), the equal of Arius in eloquence, and in the power of his logic. It was principally by the reasonings of Athanasius that the Council was persuaded to define, in the most precise manner, the doctrine of the Godhead—viz. the absolute unity of the divine essence, and the absolute equality of the three persons. All the bishops subscribed it except two, who were banished, along with Arius, to Illyricum.

An imperial edict was now issued commanding the writings of the heresiarch to be burned, and threatening with capital punishment all who should be convicted of concealing them. But at Alexandria, the Arians continued in a state of open insurrection, and began to league themselves with other condemned sects. The great influence of Eusebius was also exerted on behalf of the exiled heretic, as well as that of Constantia, the sister of the emperor, who had herself embraced Arian tenets, and in 328 permission was granted to Arius to return from Illyricum. In 330 he had an interview with the emperor; and, in the confession of faith which he presented, he declared his belief that the Son was born of the Father before all ages, and that, as the 'Word,' he had made all things both in heaven and earth. The emperor was satisfied, and sent orders to Athanasius, now Bishop of Alexandria, to receive Arius into the communion of the church. This Athanasius refused to do, and a series of tumults was the consequence. Eusebius was greatly irritated. He called a synod of bishops at Tyre, in 335, which proceeded to depose Athanasius. The emperor was even prevailed on to remove him to Gaul. In the same year, another synod met at Jerusalem, which revoked the sentence of excommunication uttered against Arius and his friends. Still the majority of the Christians of Alexandria clung to the doctrines of Athanasius. Disappointed in his expectations, Arius, in 336, proceeded to Constantinople, where he presented the emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, Bishop of Constantinople, to administer to him the holy communion on the Sunday following. Before the ceremony, however, he died so suddenly that his disciples declared that he had been poisoned, while the orthodox devoutly affirmed that God had answered the prayers of Alexander.

The manners of Arius were graceful and modest; he was noted for even an ascetic abstinence, and the purity of his moral character was never challenged by a single enemy. He is said to have composed songs for sailors, millers, and travellers, in popular measures, for the purpose of spreading his peculiar tenets; but no traces of these survive.

After his death, his followers rallied round Eusebius, now Bishop of Constantinople (338), from whom they were styled Eusebians. Constans, who ruled the West after the death of Constantine (337), and Constantius in the East, made an essay towards reconciliation; but it failed at the synod of Sardis (347), where the occidental bishops gathered themselves round Athanasius in support of the *Homousian* doctrine (identity or sameness of substance), while in a separate council at Philippopolis, the oriental bishops asserted the *Homoiousonian* doctrine (implying merely similarity of substance). Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense, and pervaded almost all departments of public and private life. Constantius having gained dominion over the West, the Arian cause, which he favoured, triumphed at the synod of Arles or Arles (353) and at that of Milan (355). These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side, and was strictly maintained by the banished Athanasius and his friends, while the Antiniceans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomæans, or Heterousians, asserted, in the boldest style, their doctrine of 'distinct substances.' The semi-Arians (a large majority in the Eastern Church) maintained the Homoiousonian doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the Apostate (361-3), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, so that they did not interfere with his plans. Jovianus and his followers in the West, Valentinianus I., Gratianus, and Valentinianus II., extended full toleration to both parties. Arianism at last was virtually suppressed in the Roman empire, under Theodosius in the East (379-95), and Valentinianus II. in the West. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Moso-Gothic language, had been the means of converting the West Goths to Arian Christianity as early as 348; and they adhered to it until the synod of Toledo in 589. The East Goths, Vandals, Burgundians, the Suevi in Spain, and the Lombards also adopted Arianism; but in all these instances the Nicene doctrine ultimately prevailed, most slowly among the Lombards, who retained the Arian creed until 662. The Arian controversy was revived in England for a time by the writings of the learned Dr Samuel Clarke (1675-1729), and also by Whiston (1667-1752). The denial of 'the eternal sonship' was broached in the Wesleyan Methodist Society by Dr Adam Clarke (1762-1832) and a few followers; but it was soon suppressed by the Conference. The greatest English writer who held distinctly Arian or semi-Arian views was Milton. Arianism has been superseded by Unitarianism. See Kölling's *Geschichte der Arianischen Häresie* (2 vols. Gütersl. 1875-83).

Arizona, a territory of the United States of America in 30° 20'—37° N. lat., 109°—114° 45' W. long. It is bounded N. by Utah, E. by New Mexico, S. by the republic of Mexico (Sonora), and W. by California and Nevada. Its western

Company.

boundary is mostly formed by the Colorado of the West, a large river remarkable for its great cañons. This river traverses the NW. part of Arizona in a deep and narrow water-worn channel (the Grand Cañon), more than 300 miles long, and nowhere less than a mile below the surface of the surrounding country. Arizona has an area of 112,920 sq. m.; it is thus nearly as large as Italy. It is in general a region of high plateaus, traversed by various mountain-ranges, presenting abundant evidence of not remote volcanic action. In the SW. the country has a desert character, and in all parts the rainfall is decidedly limited in amount. In various parts there are extensive lava-beds. The whole region lies in the drainage basin of the Colorado, though many of the smaller streams do not under ordinary conditions pay any tribute to that river, their waters being all evaporated or absorbed, except in rainy seasons. The chief affluents to the Colorado are the Gila, the Bill Williams, and the Colorado Chiquito. The main Colorado is navigated by steamboats for 600 miles, but abounds in shifting sand-bars. The water-supply over large areas of Arizona is mainly derived from deep natural wells and 'water-holes.' There are many evidences that this water-supply, probably never large, is now much smaller than in prehistoric times, there being in some districts extensive remains of abandoned aqueducts or irrigation-canal, where at present there is very little water to be had. There still exist a few Indian communities (Moquis towns, &c.), where the ancient agricultural semi-civilisation survives, though in a decadent state. The agricultural prospects of Arizona are good. It is believed that fully 10,000,000 acres of ground might be profitably irrigated. The country is in general extremely healthful; but in the SW. the summer heat is excessive, and malarial fevers are not unknown upon the bottom-lands of the Lower Colorado. The rainfall is scanty, 14.21 inches only being registered at Fort Defiance. The mean annual temperature at Tucson is almost 69°. Maize, barley, and wheat are the leading products. The Indians have from immemorial times cultivated a little cotton. The sugar-cane has been successfully cultivated in the SW. Grazing is largely carried on, and in the watered districts sheep and cattle give rich returns. The vegetation of Arizona, though not luxuriant, comprises many trees and plants not found elsewhere in the United States.

The animals are mainly those of the Rocky Mountain region. The avi-fauna is rich, many Mexican birds occurring here either as residents or as visiting species. The 'Gila monster' (*Heterodermis horridum*) is remarkable as being the only known venomous species of lizard; and the 'horned toad' (a lizard) is very common.

Arizona is an important seat of gold and silver mining; the aggregate value of these metals produced from the organisation of the territory to the end of 1885 being over \$17,250,000. The product for the year 1885 was officially estimated at \$6,595,146. The precious metals are generally obtained from regular lodes, since the absence of a sufficient water-supply makes 'placer' and hydraulic mining for the most part unprofitable. Copper is also mined and smelted very largely. Coal has been obtained at various points. Rock-salt, lead, and other valuable mineral deposits are reported from almost every part of the country; but many of the most profitable mining enterprises are seated in the south-eastern districts. It has been observed that the richest mines of the precious metals are on a belt crossing the territory from NW. to SE. The territory is traversed from east to west by two

great lines of railway, of which the Atlantic and Pacific crosses in the northern central region, and the Southern Pacific Railway in the southern part of the country. The manufacturing interests of Arizona are for the most part connected with the mines. The crushing, milling, and amalgamation of ores is an important business. Ores rich in lead, and some others, are largely smelted, instead of being milled and amalgamated.

The principal towns are Prescott, the capital (pop. in 1880, 1836); Tucson, an old Mexican town (pop. 7007); Yuma, in the SW.; Tombstone, a silver mining centre, in the SE.; Phoenix; St John; Clifton; Globe; and Mineral Park—all mining camps of greater or less importance. Allusion has been made to the interesting old Indian towns, or pueblos, with their remarkable native semi-civilisation. In some instances these communities occupy a single large stone-built house several stories high.

This region was first visited by Spaniards in 1570, and their military post at Tucson was established in 1580. Considerable numbers of the Indians were Christianised and partly civilised by Spanish missionaries; but many of the half-civilised pueblo Indians have persistently refused to become Christians. The warlike Apaches and other wild native tribes for 300 years have given much trouble, and it was not till 1886 that the United States forces and the Mexican troops, acting conjointly in the frontier districts, gave the Apaches such a severe punishment, that their power to annoy the white settlers would appear to be for ever destroyed. Indian hostilities have from the first greatly interfered with the development of the country. After 1821 the country was a part of Mexico until 1848, when it passed to the United States under the treaty of Guadalupe Hidalgo. In 1853 the United States government effected the 'Gadsden Purchase,' by which a large area of land was obtained, most of which is now in Arizona. The territory was organised in 1863. In 1870 the population (other than tribal Indians) was 9658; in 1880, 40,440.

Ark of the Covenant, ARK OF THE TESTIMONY, or ARK OF JEHOVAH, among the ancient Israelites, an oblong box of acacia-wood, overlaid with gold within and without, two cubits and a half (3 ft. 9 in.) in length, one cubit and a half (2 ft. 3 in.) in breadth and height, in which was deposited the 'testimony,' the law of the ten commandments inscribed on two stone tablets. (In Hebrews, ix. 4, mention is also made of the pot of manna and Aaron's rod.) The lid of the *mercy-seat* was of gold, and had at each end a *cherub*, between which was the place of the *Shechinah* or visible manifestation symbolical of the Divine presence. Rings also were fastened to the ark, through which were inserted the staves by which it was carried, after being covered with a curtain of badgers' skins, with a blue cloth over all. Alike in the tabernacle and in the temple it was put into the 'most holy place,' into which, on the 'day of atonement,' the high-priest was to enter alone. The desire of the Israelites to have the ark in the army, and its solemn conveyance to the new capital in David's time, have been interpreted by some critics as revealing a somewhat sensuous conception of Jehovah as actually having his residence within it. This is but little in harmony with the spiritual idea of Jehovah found in the prophets, and it is significant that the ark is only once alluded to by them, and that in a very peculiar manner (Jer. iii. 16). The ark and the *mercy-seat* have long held an important place in the orthodox interpretation of Old Testament typology.

Professor Sayce in his Hibbert Lectures (1887)

pointed out a close parallel to the Israelitish ark in the Babylonian *papakhu* borne on men's shoulders in procession at festivals. These 'arks' filled an important place in the Babylonian ritual. They had all special names, and were the visible abodes of the gods to which they belonged. The *papakhu*, however, was not the original form, but merely a Semitic development of the *ma* or 'ship' of the pre-Semitic Sumerians. The latter was furnished with helm, oar, and mast, thus pointing back to a hoary antiquity when the first worshippers who used them dwelt by the sea-shore, as did the inhabitants of the old Chaldean city Eridu, on the shores of the Persian Gulf—whence the religion of primitive Babylonia first spread. For the Ark of Noah, see DELUGE.

Arkansas (formerly pron. *Ar'kansaw*), a state of the American Union, is bounded on the N. by Missouri, on the E. by Missouri, Tennessee, and Mississippi, on the S. by Louisiana, and on the W. by Texas and the Indian Territory. Area, 53,850 sq. m.—about that of England without Wales—of which some 800 sq. m. is water-surface. The southern limit is the parallel of 30° N. lat., and the northern boundary for the most part is on the parallel of 36° 30'. The Mississippi River washes nearly all the eastern border of the state. The extreme east and west limits are respectively 89° 40' and 94° 42' W. long. Nearly all the country is well timbered. Along the eastern border of the state, for more than half its extent from the north, lies a strip of rich alluvial and swampy land, 60 miles in average breadth, and limited westward by Crowley's Ridge, a prominent feature of the country. A similar low and wet tract is traversed by the lower Arkansas River. The southern half of the state contains great areas of yellow and loamy land of Tertiary age, interspersed thinly with tracts of red clays and hills of iron-ore. West of the Crowley's Ridge region is a considerable breadth of gray silty prairies. In the west of the yellow Tertiary loams are large patches of 'black prairie' of Cretaceous age. The west and central portions of the state form a broken hill-region of Tertiary origin. Great prairies of red loam and clay soil prevail in the W. and NW. Towards the north is the Ozark mountain-region, a broken country of high hills and ridges. The soils, though of extremely various character, are mostly good throughout the state. The coal-measures very extensively underlie the surface, and coal crops out at many points; but thus far it has not been much wrought. The quality of the Arkansas coal is reported to be excellent. Silver-bearing galena and zinc appear to be abundant, and iron-ores exist in vast amounts. The villages of Hot Springs in Garland county, and Eureka Springs in the NW. are celebrated health-resorts. The novaculite, or hone-stone, of this state is extensively wrought and exported. The Mississippi, Arkansas, Red, White, St Francis, Ouachita, and other navigable rivers afford excellent facilities for the cheap transportation of goods. In the eastern alluvial region, especially towards the north, occur several large but shallow lakes, which were formed during the great earthquakes of 1811.

Agriculture is the leading pursuit in Arkansas, and cotton is the great staple of production. Maize is also very largely produced, and considerable quantities of oats and wheat are harvested. Livestock, wool, tobacco, pork, and dairy products are marketed, and their production is receiving a rapid extension. Much attention is also given to fruit culture.

The recent development of the railway system of the state has given far greater variety and enterprise to the agriculture of Arkansas than it had

under the old system of slave labour, when cotton, maize, and pork were almost the sole articles of production. Arkansas is still one of the leading states in cotton production, and it is asserted that if all the cotton-lands were worked to anything near their full capacity, this state might furnish as much of this staple as is now raised in the whole United States. There are still very large areas of undeveloped government land, and excellent improved lands can be purchased at low rates. Although malarial fevers and severe heat are to be encountered in the marshy and flat alluvial districts, the larger portion of the country has an agreeable and healthful climate, and few parts of the republic offer greater natural attractions to the immigrant. At Washington, in the NW. of the state, the mean annual temperature is over 61°, and the annual rainfall 54.5 inches; at Fort Smith, in the W., the rainfall is 40.36 inches. The extensive forests of Arkansas are becoming a source of wealth. Hard woods prevail north of the Arkansas River, cypress swamps cover a great part of the eastern alluvial districts, and in the south there are extensive areas covered with pine. In quality, variety, and accessibility, the timber of this state is hardly surpassed. Great attention has latterly been given to the black walnut timber of Arkansas, which is extensively used by cabinetmakers. Shingles, staves, and rough lumber are largely shipped. The manufacturing interests of this state (apart from the sawing of lumber and kindred operations) are for the most part little developed. Valuable water-power exists in the hilly and mountainous districts, but it is thus far not extensively utilised. Mills for the extraction of cotton-seed oil find profitable employment. The mineral resources of the state are believed to be very large, but they have been but little utilised. Lying outside the great currents of immigration, Arkansas has, until very recent years, preserved to a remarkable degree the character of a frontier country. Even the large extent of river navigation for a long time served to hinder the development of the country, since it discouraged the construction of railways, and as a consequence, great tracts of excellent land lying at a distance from the large streams are even now very thinly peopled. The old system of slave labour and of large holdings of land was not favourable to rapid material development. This region formed a part of the French colony of Louisiana, and was purchased, together with the rest of that colony, by the United States in 1803. The earliest French settlement was made at Arkansas Post in 1685. Arkansas was organised as a territory in 1819, and became a state in 1836. An ordinance of secession was passed by a state convention in 1861, and during the war which followed, this state was the scene of several active and important campaigns.

Public education has in recent years received much attention. Much care has been bestowed in some sections on the education of the freedmen and their children. Since 1880 there has been a large movement of coloured immigrants from the older states. The light, yet fertile soil, and the warm climate of Southern Arkansas, seem specially attractive to this class of settlers, and the movement has been greatly encouraged by the planters of that section. The white population is almost entirely composed of English-speaking people of American birth.

The principal towns are Little Rock, the state capital (pop. in 1880, 13,138); Hot Springs, a celebrated health-resort, with copious thermal springs; Pine Bluff, Texarkana, Helena, Fort Smith, Eureka Springs, Arkadelphia, &c. Population of Arkansas (1820) 14,255; (1850) 209,897; (1860) 435,450; (1880) 802,525, of whom 591,531

were of white race, and the remainder nearly all of African or mixed descent.

Arkansas River, next to the Missouri the largest affluent of the Mississippi. It is 1514 miles long, rising in the Rocky Mountains, at an altitude of 10,000 feet, on the borders of Utah, and joining the 'Father of Waters' at Napoleon, 275 miles above New Orleans. Flowing generally through a level country, it presents but few obstacles to navigation. The principal difficulty is connected with its periodical rise and fall—the difference between season and season being not less than 25 feet. It varies in width from 150 feet near the mountains, to about a mile in the sandy regions, and is practicable for steamboats, during nine months of the year, to a distance of 800 miles from its mouth. It divides the state which takes its name into nearly equal parts. Its most important tributary is the Canadian River.

Arklow, a seaport of Wicklow, 49 miles S. of Dublin, at the mouth of the lovely Avoca, which is crossed here by a bridge of nineteen arches. Near it is Shelton Abbey, the seat of the Earl of Wicklow. There are ruins of the castle of the Ormonds, destroyed by Cromwell in 1649, and traces of an ancient monastery. In 1798, a bloody encounter took place here between the government troops and the United Irishmen. Pop. (1871) 5178; (1881) 4777.

Arko'na, the NE. promontory of the island of Rügen, in the Baltic. Its chalk-cliffs rise to a height of 177 feet, topped with a lighthouse, built in 1827, itself 78 feet high, from which the Danish island of Möen, 33 miles NW., can be seen. Here stood the famous fortification (Slav. *Urkun*) so long impregnable, and the temple of the Wend deity Swantewit, the most sacred sanctuary of the Slavs of Northern Germany. It was destroyed, after a long struggle, by King Waldemar I. of Denmark in 1168. The remains of the *burg-ring* or wall still stand on the land side of the promontory.

Arkwright, SIR RICHARD, celebrated for his inventions in cotton-spinning, was born at Preston, in Lancashire, December 23, 1732. Of humble origin, the youngest of thirteen children, he was bred to the trade of a barber, and his early opportunities of cultivation were exceedingly limited. About 1750 he settled as a barber in Bolton, and for several years became also a dealer in hair. A secret process for dyeing hair, said to have been discovered by himself, increased considerably the profits of his trade. Very little is known regarding the first movements of his mind in the direction of mechanical invention. His residence in the midst of a cotton-spinning population naturally led him to take an interest in the processes used in that manufacture. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in the construction of his apparatus. About 1767 he seems to have given himself wholly up to inventions in cotton-spinning. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair moving slowly in contact, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. No previously invented machinery had been able to produce cotton-thread of sufficient tenacity and strength to be used as warp. An invention, indeed, by Mr Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives Arkwright of the honour of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said,

was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time Arkwright was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a Burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Mr Jedidiah Strutt of Derby, the celebrated improver of the *stocking-frame*, who, in conjunction with his partner Mr Need, entered into partnership with Arkwright.

In 1769 Arkwright set up his first mill, driven by horses, and took out a patent for his invention. In 1771 he set up a larger factory, with water-power, at Cromford, in Derbyshire. In organising his business, Arkwright showed remarkable energy and capacity; and he may be regarded as the founder of the factory system. In 1775 he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs, that he was obliged, in 1781, to prosecute at once nine different manufacturers. The first action, against Colonel Mordaunt backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, Arkwright published a pamphlet containing a statement of his case. In a new trial in 1785, he obtained a favourable verdict. The whole question, however, was brought finally before the Court of Queen's Bench, a few months after, when Arkwright's claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of Arkwright's old assistant Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out Arkwright as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited against him on the ground that his mechanical improvements diminished the demand for labour; and on one occasion, a large factory belonging to Arkwright was destroyed in the presence of a powerful military and police force, without a word of interference from the magistrates. Arkwright, however, triumphed over all opposition. In 1790 he introduced the steam-engine into his works at Nottingham; and at the time of his death in 1792, the value of his property amounted to about half a million sterling. In 1786 he was appointed high-sheriff of Derbyshire; and on the occasion of presenting an address to the king, congratulating him on his escape from the knife of the maniac Margaret Nicholson, he received the honour of knighthood. A severe asthma had pressed upon him from his youth; and a complication of disorders, the result of his busy sedentary life, terminated a remarkable career at the comparatively early age of sixty.

Arlberg is the name of a crystalline mountain mass amongst the Western Alps, which forms the boundary between the Austrian provinces of Tyrol and Vorarlberg ('the land before or beyond the Arlberg'). The pass over this ridge, that on the route from Bludenz to Landeck and Innsbruck, is 5300 feet high, and is one of the most difficult in the Tyrolean Alps, though it is practically the only

one between the two Austrian provinces. The scheme for a railway with a tunnel through the Arlberg Alp took definite shape in 1880, and the railway from Innsbruck to Bludenz was opened 15th November 1884. The railway is through a singularly beautiful mountain country, and is much frequented by tourists to and from Italy. The main tunnel is 6720 yards in length, and cost £1,500,000.

Arles, one of the oldest towns in France, in the department of Bouches du Rhone, situated on the left bank of the principal branch of the Rhone, 15 miles from the sea, and 53 miles NW. of Marseilles by rail. It is famous for its Roman remains, including baths, a palace of Constantine, an aqueduct, and an amphitheatre (460 feet by 340 feet) capable of accommodating 25,000 spectators. The Champs Elysées were an early Christian burying-ground, and the museum contains many Roman and early Christian antiquities. The cathedral of St Trophimus (7th century) has a splendid doorway and ancient cloisters. Arles manufactures silk, hats, tobacco, brandy, soap, glass bottles, and railway wagons. The marshes which rendered the district unhealthy have been partially drained, and a canal has been formed which connects it with the harbour of Bouc on the Mediterranean. Arelate or Arelas under the Romans was the seat of a prefect; afterwards, for some time, the residence of the Gothic king, Eurich; and in 879 the metropolis of the kingdom of Arelate (see **BURGUNDY**). It was a free city in the 12th century. In the early Christian times, several important synods were convened here (314, 354, 452, and 475 A.D.). Pop. (1881) 14,431.

Arles, a term used in Scotland and the north of England for a piece of earnest-money given in confirmation of a bargain or engagement, especially when a servant is hired. The ultimate origin of the word is the Latin *arrha*, 'earnest-money,' 'part of the price paid down.'

Arlington, HENRY BENNET, EARL OF, was born at Arlington, Middlesex, in 1618, and from Westminster School proceeded to Christ Church, Oxford. During the civil war, at Andover he got a lifelong scar on the nose; afterwards at Madrid, as Charles's agent, he acquired an equally lasting pomposity. The Restoration brought him back to England. Created Lord Arlington in 1663, and Earl of Arlington in 1672, he was not the most scrupulous member of the unscrupulous Cabal (q.v.). In 1674 he was impeached as a promoter of popery, a self-aggrandiser, and a betrayer of trust—in brief, as the 'conduit-pipe' of Charles's evil policy. The impeachment fell through; but Arlington found it desirable to exchange the office of secretary of state for that of lord chamberlain, and finally he retired to his Suffolk seat, Euston, where he died, 28th July 1685.

Arlon (anc. *Orolanum*), a town of Belgium, the capital of the province of Luxemburg, 27 miles WNW. of Luxemburg by rail. It is a neat and prosperous town, and has a considerable trade in corn, iron-ware, tobacco, crockery, and clay-pipes. The town is mentioned as early as 870; the nunnery of Clairefontaine, in the neighbourhood, is now a foun-dry. Pop. (1883) 7684.

Arm. The upper extremity of the human body may be divided into three portions—viz. the shoulder, the hand, and the intermediate shaft or arm. The latter consists of an upper arm and a forearm. In the upper arm there is one bone, the humerus, *h* (fig. 1). This bone presents a globular head, which articulates with and moves freely upon the scapula, *s*, forming the shoulder-joint. At the junction of the head and shaft of the humerus, there is a constriction termed the anatomical neck.

The shaft is cylindrical in its upper part, but becomes flattened and somewhat three-sided below. A short distance above its lower end, and on the inner side, a hooked process pointing downwards is not unfrequently found. This represents a process of bone forming a complete foramen in carnivorous animals, through which the main artery and nerve of the limb run. At the lower end of the shaft two articular surfaces for the bones of the forearm are found; the outer, rounded for the head of the radius, *r*; the inner, a pulley or trochlea for

Fig. 1.—Bones of the Human Arm:

h, humerus; *r*, radius; *u*, ulna; *w*, wrist-joint; *hd*, hand; *s*, scapula; *c*, clavicle, or collar bone.

Fig. 2.—Muscles of the Human Arm:

abc, deltoid muscle; *d*, coraco-brachialis muscle; *r*, *r*, triceps; *e*, *i*, extensors of wrist and long supinator of the hand; *km*, flexor of fingers and radial and ulnar sides of the wrist, and *l*, palm of the hand, or palmaris longus; *p*, palmaris brevis; *q*, palmar fascia; *o*, biceps.

the movements of the ulna, *u*. The bones of the forearm are two in number, the radius and ulna; the former being placed upon the outer, the latter upon the inner aspect of the forearm. By their upper ends, these bones articulate with the humerus, to form the elbow-joint; by their lower ends, with the carpus, to form the wrist-joint, *w*.

The shoulder-joint is constructed upon the plan of a ball and socket, the bones being held in position by a capsular ligament which is very loose, thereby allowing freedom of movement to a greater extent than in any other joint in the body. This gain in movement occasions a loss of stability, hence dislocations are frequent. For the most part, the head of the humerus is driven downwards into the armpit, this being the only side of the joint unsupported by muscles passing to be inserted into the upper end of the shaft. See **SHOULDER**.

A large triangular muscle, the *deltoid*, raises the arm from the side—a movement distinctively human; it is depressed by the *coraco brachialis*, the *latissimus dorsi* (the great muscle of the back), and the *pectoralis major* (the great muscle of the chest); in addition, it can be carried forwards and backwards by the action of these muscles.

Circumduction is the result of a combination of these movements.

The elbow-joint is hinge-like or ginglymoid. It is provided with strong lateral ligaments, and its movements are extension or straightening of the forearm produced by the *triceps*; flexion or bending by the *biceps*, *brachialis anticus*, and *supinator longus*. During the latter movement, the twist upon the trochlear surface at the lower end of the humerus causes the hand to be carried inwards in the direction of the mouth.

Joints called radio-ulnar are found between the bones of the forearm at their upper and lower extremities. The movements at these joints affect the hand, for it articulates with the lower end of the radius to which they are principally due. When the radius rolls forward upon the ulna, the palm of the hand is turned downwards—*pronation*; when it rolls backwards, the palm is turned upwards—*supination*. Each movement is produced by two muscles, which take their fixed points from the humerus and ulna.

A variety of the hinge-joint is found between the radius and carpus, for, in addition to flexion and extension, the hand can be drawn to the radial or ulnar borders of the forearm. These movements are effected by the *palmaris longus*, the flexors and extensors of the radial and ulnar sides of the wrist.

The upper extremity is supplied with blood by the continuation of the axillary trunk, the brachial artery, and its branches. The veins collect into large superficial trunks, which unite at the bend of the elbow, at which situation one is frequently selected for venesection, and then pass on to join the axillary, on the outside by the cephalic vein, on the inner side by the basilic. The axillary vein is formed by the junction of superficial vessels just mentioned with the deeper companion veins which accompany each branch of the brachial artery.

The nerves pass down as large cords by the side of the artery, and diverge from it to their ultimate distributions; the musculo-spiral soon passing round the back of the upper arm to appear on the outside, and become the radial and posterior interosseous nerves; the ulnar running behind the internal condyle, for which it has obtained the term 'funny bone,' from the electric-like thrill which passes along the arm when the nerve is struck or pressed. The median, as its name implies, keeps a middle course with the artery. See NERVOUS SYSTEM.

The arm affords excellent illustrations of some of the principles of mechanics. The insertion of the muscles so near, as will be seen, to the fulcrum or centres of motion, involves a loss of power in the usual sense of the word; there is, however, a corresponding gain in velocity at the end of the lever; and for most of the purposes to which the hand is put, agility is of far greater moment than dead strength. See LEVER.

As far back as 1795, attention was first directed by White to the proportion between arm and forearm. Subsequent measurements have shown that a long humerus, and a still longer radius, are essentially ape-like characters, while the very reverse is typical of man, in whom the radius is shorter than the humerus. In anthropoid apes, the arm, from shoulder to wrist, is therefore longer than in man.

Extending the investigation to the different races of mankind, we find that there is very little divergence, except in the case of the African negro and Australian aboriginal, in whom the forearm is longer than in the white races. Notwithstanding this approximation to the anthropoid type, the arm of the negro, from shoulder to wrist, is a little shorter than that of the European. The explanation of this anomaly is found in the fact that the

humerus of the negro is shorter than that of the European, and thus two inferior characters—a short humerus and a long radius—have combined to produce a superior one—a short arm. This affords an illustration of the fact that the proportions between human and anthropoid skeletons may approximate at one point while they diverge at another, even in the same type.

Arma'da, a Spanish word signifying simply an armed force, but applied specially to the great Spanish fleet fitted out against England in 1588. The king of Spain, Philip II., had resolved to strike a decisive blow at Protestantism by conquering England, which Pope Sixtus V. had formally made over to him. The ports of Spain, Portugal, and other maritime dominions belonging to him, had long resounded with the noise of his preparations, and the most eminent Catholic soldiers from all parts of Europe flocked to take a share in the expedition. The Marquis of Santa-Cruz, an admiral of reputation and experience, received the command of the fleet, and the famous Duke of Parma of the land-forces. The latter had already gathered 30,000 men in Flanders, and merely waited the arrival of the armada to protect his crossing. As no doubt was entertained of success, the fleet was ostentatiously styled the Invincible Armada. When ready for sea, it consisted of 129 vessels, 65 of which were over 700 tons, and was manned by 8000 sailors, while it carried 19,000 Castilian and Portuguese soldiers, over 2000 cannon, and provisions sufficient to feed 40,000 men for six months. A squadron of 80 ships, only 30 of which were ships of the line, was all that Elizabeth had to oppose it by sea; but although the English fleet was much inferior in number and size of shipping to that of the enemy, it was much more manageable, while it was manned by 9000 of the hardiest seamen in Europe. Lord Howard of Effingham, a Catholic of great valour and capacity, took upon him as lord high admiral the command of the fleet; Drake, Hawkins, and Frobisher served under him; while a few ships, under Lord Seymour, lay off Dunkirk, to watch the Duke of Parma. Such was the preparation made by the English; while all the Protestants of Europe regarded this enterprise as the critical event which was to decide for ever the fate of their religion. Drake's daring attack on the store-ships in the harbour of Cadiz had already delayed the expedition, and it was further delayed at the moment of sailing by the death of the admiral Santa-Cruz. Scarcely had it actually sailed under command of the Duke of Medina Sidonia, a seaman of but little experience, when a gale in the Bay of Biscay drove it for shelter into Ferrol. Some time was lost in refitting, and it was not till the end of July that the sails of the fleet were seen from Lizard Point, and the English beacons had flared their alarm all along the coast. The armada was disposed in the form of a half-moon, stretching seven miles from the one horn to the other. The Spanish admiral, instead of going to the coast of Flanders to take in the troops stationed there, resolved to sail directly to Plymouth, and destroy the shipping in the harbour. But Howard slipped out of Plymouth Sound, and hung with the wind upon his rear. He refused to come to close quarters, but attacked the Spaniards at a distance, pouring in his broadsides with admirable dexterity, and escaping at will in his swift and easily handled vessels out of the range of the Spanish shot. Galleon after galleon was sunk, boarded, or driven on shore, and 'the feathers of the Spaniard were plucked one by one.' As the armada advanced up the Channel, the English still followed and harassed its rear, and the running fire continued throughout the week, until the Spaniards took shelter in the

port of Calais. At midnight Howard sent eight of his smaller vessels, filled like fireships with combustible materials, and ablaze, into the midst of the enemy. The Spaniards in panic cut their cables and stood out to sea, while the English ships pursued closely, and came up with them at dawn off Gravelines. Broadside after broadside the English poured into the towering ships of the armada, which in their turn were unable to do any great damage to them. At the close of six hours' furious fighting they found their best ships shattered to pieces and drifting with a north-west wind upon the sandbanks of Holland. More than 4000 men had fallen, while on the English side not a hundred men had been killed, and not a ship had been taken. The Spanish admiral in despair called a hasty council of war, in which it was resolved that, as their ammunition had begun to fail, as their fleet had received great damage, and as the Duke of Parma had refused to venture his army under their protection, they should return to Spain by sailing round the Orkneys, the winds being contrary to their passage directly back. The English ships were soon compelled to fall back from want of ammunition, with which they had been but stingily supplied through the ill-timed cheese-paring policy of the queen; but the storms of the northern seas broke upon the armada, and finished the work of destruction. When Howard fell back from the pursuit, on the 13th of August, there were still 100 vessels in the Spanish fleet; fifty-four only, and these in miserable condition, their crews dying of sickness and exhaustion, ever reached the ports of Spain. The rocks of the Hebrides and the western coast of Ireland were not more fatal to the ships than the hungry Islemen and Irish to their hapless crews. The seamen, as well as the soldiers who survived, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate valour of the English, and of the tempestuous violence of that ocean by which they were surrounded. The English queen struck a medal bearing the inscription, *Deus flavit, et dissipati sunt*, 'God blew, and they were scattered.' The story of the armada has been well told by Froude in the last volume of his History, and by Kingsley in the romance of *Westward Ho*; its opening chapter by Macaulay in a spirited ballad.

Armadillo (*Dasypus*), a genus of mammals in the order Edentata (q.v.). They are not, however, toothless, as the word Edentate would suggest, but provided with a variable number of simple molars, destitute of true roots, and distant from one another, so that those of upper and lower jaw interlock when the mouth is shut. Only in one case are there teeth which are not molars. The elongated snout bears at its tip the downward directed nostrils. The tongue is smooth, slender, and glutinous, but not long and extensible like that of the ant-eaters. The eyes are small and weak, probably in association with the burrowing habits of the animals, but the senses of smell and hearing are acute. The limbs are short and strong, and bear powerful claws, much used in burrowing. This they do very rapidly when in danger, while some, such as *D. apar*, protect themselves by rolling up into a ball and exposing only the armoured dorsal surface. This bony armour is indeed their most striking peculiarity, which distinguishes the genus from all other mammals except the allied Chlamyphorus. It consists of shields on head, neck, shoulders, and rump, and of movable cross bands of plates across the back. Even the tail may be thus armoured. In this way some of the armadillos have retained their foothold in the struggle with higher animals. Naturally timid and passive, they can, if forced, use their powerful claws in self-defence. They are

nocturnal in habit, and feed on insects, worms, fruits, roots, and sometimes on carrion. They are distributed from Mexico and Texas southwards to Patagonia, and occur in immense numbers in the

Three-banded Armadillo (*Dasypus apar*).

woods and pampas. The largest of the numerous species (*D. gigas*) is fully 3 feet long, exclusive of the tail, which measures a foot and a half more, while the smallest is not above 10 inches in length. Though all are eaten, the flesh of the more vegetarian species is particularly esteemed. Nearly allied is the small hairy Chlamyphorus, which has no shields, but a loose leathery armour formed of 24 cross bands of plates. In the pleistocene strata of South America, the armadillos are represented by giant fossil forms. See GLYPTODON.

Armadillo. See WOOD-LOUSE.

Armageddon, the great battlefield of the Apocalypse, in which the final struggle between the powers of good and evil is to be fought. Its name was undoubtedly suggested by that famous battlefield, Megiddo (Judges, v. 19), in the plain of Esdraelon, on which some of the most important battles in the history of Israel were fought, as the victories of Barak over the Canaanites, and Midian over the Gibeonites, as well as the defeat of Saul by the Philistines, and of Josiah by the Egyptians.

Armagh, the capital of County Armagh, 33 miles SW. of Belfast, is situated around and on a gentle eminence, whence its original name, Ard-Magha, 'the high field.' It is well built of limestone. The cruciform cathedral (184 by 119 feet), dating from the 12th century, is built of red sandstone, and is supposed to occupy the site of that erected by St Patrick in the 5th century. A Gothic Roman Catholic cathedral occupies the principal height to the north, and the primate's palace that to the south. There are a college, a celebrated observatory, a county court-house, prison, public library (founded in 1771), fever hospital, district lunatic asylum, infirmary, and barracks for 200 men. It is the seat of the archiepiscopal see of the Primate and Metropolitan of all Ireland, who, before the disestablishment of the Irish Church, had an income of £12,087 a year. The chief manufacture is linen-weaving. Armagh, from 495 to the 9th century, was the metropolis of Ireland, the native kings living at Eamania, 2 miles to the west of the city. It was then renowned as a school of theology and literature—its college being the first in Europe. After the Reformation, it suffered severely in the conflicts between the English and Irish; it contained only three slated houses in 1765, since which time it has been rebuilt. Under the Redistribution of Seats Act (1885), Armagh ceased to be a parliamentary borough. Pop. (1871) 8946; (1881) 10,070.

Armagh, a small inland county in Ulster, Ireland; bounded N. by Lough Neagh, E. by Down, S. by Louth, W. by Monaghan and Tyrone. Its greatest length is 32 miles, and breadth 20. Area, 512½ sq. m.; about one-half is under tillage, and the remainder in pasture, plantations, and bog, hill, and under water. The surface is hilly in the SW., and undulating in the centre, attaining in Slieve Gullion, in the SW., the height of 1893 feet. The country bordering upon Lough Neagh is low and boggy, and the Louth plain extends into the south end of Armagh. The principal rivers, navigable in their lower parts, are the Callan, the Tynan, the Upper Bann, flowing out of Down NW. for 11 miles before it enters Lough Neagh, and the Blackwater, which in its lower part separates Armagh from Monaghan. The rocks of Armagh are—Lower Silurian in the south and middle of the county; the trap of Antrim, with the underlying greensand, around Portadown; carboniferous limestone in the basins of the Blackwater and Callan; granite in the mountains of the SE.; and Tertiary strata bordering Lough Neagh. The soil is fertile, with a good deal of bog. The chief crops are oats, potatoes, wheat, turnips, and flax. The north and central parts of Armagh exhibit a dense population, low hills cultivated to the tops, hedgerows, orchards, and thickly scattered farmsteadings. Besides agriculture, linen and cotton weaving are the chief industries. Apples are largely grown. The county is mostly in the diocese of Armagh. It returns three members of parliament. The chief towns are Armagh, Lurgan, Portadown, and part of Newry. Pop. (1861) 190,086; (1871) 179,260; (1881) 163,177, of whom 75,709 were Roman Catholics, 53,390 Episcopalians, and 28,077 Presbyterians.

Armagnac, the old name of a district in the south of France, a part of Gascony now mostly included in the department of Gers. The soil is fertile, and its wine and brandy (*Eau d'Armagnac*) are well known. The inhabitants are noted for their simplicity, strength, and bravery; but are credulous and ignorant. The name *Armagnacs* was borne by a band of soldiers who did good service in the early history of France against the English and Swiss. The family of the Counts of Armagnac, which ended in 1497, played an important part in French history.

Armatoles, the warlike inhabitants, since the 15th century, of the mountain districts in Northern Greece, especially in Macedonia, Epirus, and Thessaly. At one time, as robbers, they ravaged the neighbouring country, at another time protected its wretched inhabitants from other robbers in consideration of black-mail. The Turkish pashas, unable to subdue them, made terms with them, and tried to metamorphose them into a sort of military police, intrusting to their care the safety of the public roads, and dividing the country into districts, each under the supervision of a chief of these militia. But although the Armatoles frequently suppressed the brigandage of the Klephts, they still regarded them as brothers of common origin and faith, and shared with them their hatred for the Turkish yoke, however nominal it might be. The Turks at last alarmed at this sympathy, tried to substitute for the Armatoles the Mohammedan Albanians, who were the implacable enemies of the Greeks. The moment the Greek insurrection broke out, in 1820, the Armatoles joined the insurgents 12,000 strong, and they at least gained some glory in the war.

Armature is the term applied to the pieces of soft iron that are placed at the extremities or poles of magnets to preserve their magnetic power. See **MAGNETISM**.

Armenia, a high tableland in the upper valleys of the Euphrates, Tigris, Aras, and Kur, 400 to 500 miles long, by nearly the same breadth. In ancient times an independent country, it repeatedly recovered its independence down to the middle ages, although with varying boundary. It is now, however, distributed between Russia, Turkey, and Persia, and stretches, in its utmost extent, from Asia Minor on the W. to the Caspian Sea on the E., and from the Caucasus on the N. to the Murad Su on the S. The interior consists mostly of pastoral plateaus, 2700 to 7000 feet above sea-level, crowned by conical heights or traversed by mountain-chains, and culminating in Mount Ararat, 16,969 feet high. A chain of mountains, stretching from Ararat to the confluence of the two head-waters of the Euphrates, divides Armenia into a northern half, containing the plateaus of Bayazid, Erzerum, Kars, Akhalzikh, and Erivan; and a southern half, in which lies the plain of Murad Su, 4650 feet high at Mush. On the plateau of Erivan, the principal cones are Little Ararat, 12,840 feet high; Great Ararat, 17,212 feet; and Ala Göz (with three pinnacles), 13,436 feet. Surrounding Lake Van is the chain of the Ala Dag, rising, in Tura Jelu, to 13,720 feet. To the east of the valley of the Aras, the plateau of Kara Bagh attains a height of 11,000 feet. The mountain-system of Armenia is mostly volcanic, in which trachyte and augite porphyry are mainly represented. The numerous cones are for the most part old craters. The volcanic nature of Armenia is still testified by its hot mineral springs, such as the sulphur springs of Tiflis, and by its earthquakes, which, in 1840, wrought the complete destruction of a village of 200 houses on Mount Ararat, and in 1859, of the town of Erzerum. The Murad Su or East, and the Kara Su or West Euphrates, form the head-waters of the Euphrates; whilst the Shett, rising to the south of Van Lake, and an arm of the Diarbekr, rising in the Alinjik Dag, constitute the head-waters of the Tigris. Other rivers are the Aras, the Kur, and the Tcholak. Of lakes, there is Van in Turkish, Goktcha or Sevan in Russian, and Urmia in Persian Armenia. Armenia is rich in metals, possessing mines of silver, lead, iron, arsenic, alum, rock-salt, and especially copper.

The climate is distinguished into a region of rains, with subtropical climate, embracing the valley of the Kur from Tiflis to the Caspian Sea and the valley of the Upper Tigris; a region of perpetual snow, which, in Ararat, except on the NW. side, starts as high as 14,000 feet, but elsewhere descends some 3000 feet lower; and an intermediate region of very various grades, including the plateau of the frontier mountains and the plateau chains, to a height of 12,000 to 13,000 feet. This third zone ranges from a South-European climate in the plain of the Kara Hissar, to a Mid-European climate, with harvest as late sometimes as August and September, in the mid-slopes of the frontier mountains. The plateaus—volcanic, dry, and singularly bare of wood—have a very severe climate; the winters long and inclement; the summers short, very hot during the day, but always cold at night. The cold north winds, against which Armenia has no protection, encountering the east and south winds, give rise to the storms that render the navigation of the Black Sea coast so dangerous. Much the richest belt of vegetation is the broad valley of the Aras; but the marshes produced by the many irrigating channels make this the most unhealthy part of Armenia. There are, nevertheless, rich vineyards and orchards, fields of cotton, tobacco, rice, hemp, and flax. The high tablelands are chiefly pastoral, though a little corn is also cultivated.

The ancients distinguished *Armenia Major*, the larger and eastern half, bordering on Media and the Caspian Sea, on Mesopotamia and Assyria, from *Armenia Minor* to the west of the Euphrates. Turkish Armenia comprises, besides the old Armenia Minor, the vilayets of Van, Bitlis, Dar-sim, Erzerum, as also parts of the vilayets of Diarbekr and Charput. Russian Armenia, formerly Persian, forms the NE. part of old Armenia Major, and includes the governments of Erivan, Elizabet-pol, and Kars, as also parts of the government of Tiflis. In this Russian division of Armenia are situated the three old monasteries—Etchmiadzin, seat of the patriarch of Armenia, Haghpad, and Sanahine. Persia holds the SE. corner of Armenia Major in the province of Azerbijan.

The Armenian is rather above middle stature, of darkish-brown or yellow complexion, with black, straight hair, large nose, wide rather than high forehead. He is of quick, adaptive intelligence, and specially qualified for trade. The women are often handsome, with erect carriage, regular features, and fine dark eyes. Only a part of the Armenians live in Armenia, most of them having been long dispersed all over the world. Yet is their essential national cohesion and indissolubility of national character almost as strong as is that of the Jews, though it has not had such unremitting fires of persecution to anneal it. They belong to the Iranian group of the Indo-Germanic family. The Armenians, at the present day, are to be found in almost all Turkish provinces; in Russia, Persia, and India; in the great commercial cities of the Mediterranean; in the Austrian empire; at London, Manchester, and other capitals of Western Europe, occupying posts as money-changers, bankers, and merchants, though also as artisans and porters. Their number in Armenia itself is estimated at 1,000,000 at the most; in Persia and adjacent territories, 100,000; in European Turkey, 400,000; in Russia, 500,000; in India, 5000; in Africa, 5000; in Transylvania, Hungary, and Galicia, 16,000. Their total number is calculated at not more than 2,500,000. Among the foreign invaders domesticated in Armenia are the Turks, mostly engaged in agriculture; the nomadic Kurds; in the SE., the Tartars; Nestorians occupying the mountains of the Persian frontier, and speaking a Syriac dialect; Georgians, in the north. Greeks, Jews, and gipsies are also scattered throughout Armenia. The Armenians themselves are at home mostly shepherds and tillers of the soil, living in low, mud-built cottages, or underground dwellings, very meagrely furnished. The houses are built at the side of or round a small court-yard, the rooms with no apertures for light except into the yard. The cattle sometimes house with the family. In summer, the roof is utilised for smoking, eating, and sleeping. Marriages are arranged by the parents, and the women have a place very subordinate to that of men. So late as 1856 a wife might not speak to her sister-in-law for the first six months after marriage; nor to her mother-in-law for nine months; nor to her father-in-law for eighteen months; and when at last she might speak, it must be in a whisper; and the whisper survives even to-day in a London Armenian family. The women, seldom the men, weave carpets, silk and woollen stuffs, stockings, horse-coverings, shawls, &c., but especially lace, for which gold and silver threads are obtained from Russia. Long centuries of oppression and almost servitude have very much sapped the military habits and spirit of the people, though in the last Russo-Turkish war many Armenians distinguished themselves by their bravery. A large number hold high places in the Russian army, among the most distinguished being General Loris Melikoff.

History.—The Armenians called themselves Haik, whence Hajaстан, the Persian name for Armenia; the name Armenia being conferred by the Medes, who applied this, the name of a single obscure clan, to the whole land. They have been known as a nation under this name since the time of Herodotus, and probably earlier. After being ruled by kings of their own, they fell successively under the Assyrian, Median, and Persian empires, retaining under the Persians their own princes, and merely paying tribute to the Great King. Having, under Digran or Tigranes, become the centre of an empire extending from the Orontes to the Caspian, Armenia was shattered by the Roman Lucullus, who penetrated to Artaxata at the NE. of Ararat (69 B.C.). Shapur, the second of the Sassanid kings, conquered Armenia, but under Diocletian it was recovered for Rome, and Tiridates the Great returned to his ancestral throne. This Tiridates having been converted to Christianity by St Gregory the Enlightener, Armenia became henceforward the bulwark of Christianity in Asia. Overrun by the Persian fire-worshippers, and, after the fall of Persia, by the Mohammedan califs of Bagdad, sometimes supported, sometimes abandoned, by the Byzantine emperors, and a prey to internal dissensions, Armenia yet re-emerged, in the 9th century, into a state of importance.

In 885 A.D., Aschod I., of an old and powerful Armenian family, ascended the throne, with the permission of the califs, and founded the third Armenian dynasty—that of the Bagratidæ, who claim descent from King David of Israel. Under them Armenia was prosperous. The magnificent ruins of their capital at Ani, between Etchmiadzin and Kars, still testify to the transitory splendour of their kingdom. In the 11th century divisions and internal strife again began to weaken the country; till at length the Greeks, having murdered the last monarch of the Bagratidæ, seized a part of the kingdom, while the Turks and the Kurds made themselves masters of the rest—only one or two of the native princes maintaining a perilous independence. In 1242 the whole of Armenia Major was conquered by the Mongols. Leon VI., last king of Armenia, was taken prisoner by the Saracens, 1375, and died at Paris in 1393. In 1472 the eastern part of Armenia became a Persian province. Afterwards the western part fell into the hands of the Turkish sultan, Selim II.

The subsequent history of Armenia is that of devastation by the Mongols and the hosts of Timur, and of a long contest between the Ottoman sultans and Persia for the possession of that ancient kingdom. At length Russia approached from the north, welcomed by the Armenians as a suzerain preferable to either Turkey or Persia. Even before crossing the Caucasus and establishing herself in Georgia, Russia had interfered for the protection of the Armenian Christians. The Armenian patriarch Narses, too, had encouraged his people to look to Russia for protection. In 1827 the Czar wrested from Persia the whole of the upper valley of the Araxes, including Etchmiadzin. On the conclusion of peace between Russia and Turkey in 1829, when the Russians retired from Erzerum, a multitude of Armenian subjects of Turkey followed them, electing to settle in Russian territory. According to Professor Bryce, Mr Creagh, and other travellers, the Armenians enjoy, under Russia, security of person and property, and protection for the honour of their families, such as was not vouchsafed to them by either Turkey or Persia. At the close of the Russo-Turkish war, by the Treaty of Berlin (1878) Ardahan and Kars were ceded to Russia, thereby adding 6687 sq. m. of territory, with a population of 271,151, to the district of Erivan already in

Russian possession. During the negotiation of the Berlin Treaty, Great Britain entered into a secret compact with the sultan, guaranteeing Turkey the integrity of her Asiatic possessions on condition that Turkey should effect reforms in their administration, and protect the Armenians from the Kurds and the Circassians. Turkey has utterly disregarded her part in this compact. The invasion of the Kurds in 1882, under their chief Obeidullah, a vassal of Turkey, was especially destructive of life and property to the Armenians.

In Russia, where they have found protection since the time of Peter the Great, the Armenians have formed communities at St Petersburg, Moscow, and in South Russia. The congregation of Armenian Mechitarists (q.v.) at Venice is celebrated. In London, Manchester, Amsterdam, and Marseilles are Armenian merchant-houses. Armenians have been settled at Manchester since about 1840. In 1862 they had grown numerous enough to rent a private house for the celebration of divine worship. In 1870 they built an Armenian church, where divine service is conducted every Sunday, according to the ritual of the (non-united) Armenian Church, whose 'Catholikos' has his seat at Etchmiadzin. The number of Armenians in Manchester is about 120, their 35 merchant-firms negotiating the commerce between that city and Turkey, Persia, and the Russian Caucasus. There is also a pretty numerous Armenian community in London, composed for the most part of Armenian families from India. There are, besides, one or two Armenian merchants at Liverpool, and almost always a few Armenians studying at Edinburgh and Oxford.

The Church.—The earliest authentic accounts of the introduction of Christianity into Armenia date from the apostolical exertions of St Gregory (q.v.), who in the beginning of the 4th century converted King Tiridates and a large part of the people. In the same century Armenian Christians were found studying at Athens. Christianity was further confirmed in Armenia by Mesrob's translation of the Bible into the Armenian language in the 5th century. In the ecclesiastical controversy concerning the twofold nature of Christ, the Armenian Christians refused (491 A.D.) to accept the decisions of the Council of Chalcedon, and constituted themselves a separate church, which took the title of Gregorian from Gregory himself. For several centuries a spirit of scientific inquiry, especially in theology, manifested itself amongst them to a far wider extent than in the other eastern churches. Their greatest divine is Nerses of Klah, belonging to the 12th century. The Roman Catholic popes at various times, especially (1145, 1341, 1439) when the Armenians accepted the help of the West against the Mohammedans, tried to persuade them to recognise the papal supremacy; but only in 1439 was union with Rome accepted by the scattered members of the Armenian Church outside of Armenia, on the basis that, while assenting to the dogma of the two natures, they should retain their national and ritual peculiarities. The Armenian Church was thus split up into a Catholic or united, and a Schismatic or non-united party, fanatically opposed to each other. The dogma of the pope's infallibility induced for a time dissension among the united party. The theology of the *Schismatic* or non-united Armenians attributes only one nature to Christ, and holds that the Spirit proceeds from the Father alone; the latter doctrine, however, being held by it in common with the 'orthodox Greek Church,' although contrary to the theology of the western churches. With respect to the 'seven sacraments,' it entertains the peculiar notions that at baptism one must be sprinkled three times, and as often dipped; that confirmation is to be con-

joined with baptism; that the Lord's Supper must be celebrated with pure wine and leavened bread; that the latter, before being handed round, must be dipped in the former; and that extreme unction is to be administered to ecclesiastics alone, and that immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek Church in the number of its fasts, but has fewer religious festivals. Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is in the new. Its sacerdotal constitution differs little from the Greek. The head of the church, whose title is Catholikos, and to whom the Armenian patriarchs of Jerusalem and Constantinople are subordinate, resides at Etchmiadzin, a monastery near Erivan, the ecclesiastical metropolis of the Armenian nation since 302 A.D., and claiming to be the oldest monastic foundation in the world. Incorporated in this monastery is a seminary or college for the education of Armenian priests, attended by about eighty young men from all parts of Asia Minor and Persia. This school is supported by the monastic revenues, which, from landed property in Erivan and Georgia, and from the contributions of the Armenian churches throughout the world, are said to amount to about £10,000 a year. Since 1839, Protestant missions, especially of the London Missionary Society, have been at work in Armenia. The American Foreign Missions have thirty-three Protestant congregations in Armenia, with more than 1800 members, many of them self-supporting, and supplied with native pastors.

Literature.—Previous to the introduction of Christianity by Gregory (300 A.D.), the Armenians had adhered to the Assyrian or Medo-Persian system of culture; but excepting a few old songs or ballads, no remains of that early period exist. After their conversion to Christianity, the Greek language and its literature soon became favourite objects of study, and many Greek authors were translated into Armenian. The earliest inscriptions are cuneiform. At a later period the Greek alphabet was used by the West, and Syriac by the East Armenians. In the beginning of the 5th century, St Mesrob, along with Sahak the Great, wrote the Armenian translation of the Bible, esteemed the highest model of classic style. The most flourishing period of Armenian literature extends from the 4th to the 14th century. The numerous Armenian theological writers and chroniclers of this era supply materials for a history of the East during the middle ages which have hitherto been too much neglected. These Armenian writers generally copied the style of the later Greek and Byzantine authors. In the 14th century literature began to decline, and few remarkable works were afterwards produced; but since their dispersion, the Armenians have ever cherished their national literature. Translations of several Greek authors, made in the 5th century, have been partly preserved, and contain some writings of which the originals have been lost—namely, the Chronicle of Eusebius; the Discourses of Philo; Homilies by St Chrysostom, Severianus, Basil the Great, and Ephraem Syrus. Among philosophical and theological writers may be mentioned: David, the translator and commentator of Aristotle, Esnik, and Joannes Ozniensis. The *Vite Sanctorum Calendarii Armeniaci* (Lives of Armenian Saints, 12 vols. Ven. 1814) contains many notices of the history of Armenia. A considerable stirring of intellectual and even literary activity has recently manifested itself both at Erivan and in Constantinople. The Armenian belongs to the Indo-Germanic group of languages, and though it is usually regarded as an offshoot of the Iranic branch, recent scholars of eminence have main-

tained its right to rank as a distinct branch, intermediate between the Iranic and European divisions of the group. It has certainly a very independent character, and has many peculiarities of structure. There are usually no distinctions of gender amongst nouns, and there are seven cases; while the verb has four conjugations and four tenses. In many respects the syntax of old Armenian, the language of literature, which is no longer a living tongue, resembles classical Greek; whereas the modern Armenian, split up into four dialects, contains many Persian and Turkish words. The Eastern dialect is, as might be expected, much purer than that of Constantinople. The language has great strength and flexibility; is consonantal and harsh to the ear. The alphabet, which has thirty-six characters, usually said to have been partly formed on the Greek model by St Mesrob, seems rather to have been adapted by him from the Palmyrene alphabet (see ALPHABET). There are grammars by Petermann (2d ed. 1872), Lauer (1869), and, of modern Armenian, Riggs (1856); and there are English-Armenian dictionaries by Ancher (1821) and Bedrossian (1879).

Appended is the verse John iii. 16, in old or ecclesiastical Armenian:

Քի այնպէս սիրեաց լսողաժ զաշխարհ՝
 փնչէ զլիրդին իւր փաժին եւ . զի ամենայն
 որ հաւատայ 'ի նա՝ փ' կորցէ; ալլ ընկալի
 զկեանսն յաւիտեանականս .

Armentières, a town in the French department of Nord, on the Lys, 12 miles WNW. of Lille by rail. It is well built and prosperous, having manufactures of cotton, linen, lace, leather, beetroot-sugar, salt, and soap, and a considerable trade in grain. Pop. (1881) 23,639.

Armeria. See THRIFT, a genus of plants.

Armfelt, GUSTAF MAURITZ, born in Finland, 1757, during the war between Sweden and Russia (1788-90) displayed remarkable courage and spirit. He defeated the Russians near Fredrikshamm, and, as military representative of Gustavus III., concluded the peace of Verelä. In 1792 Gustavus, mortally wounded by an assassin, signed a codicil, intrusting the regency to his brother, Charles, during the minority of Gustavus IV., and naming Armfelt governor of Stockholm. Charles, however, destroyed the codicil; and Armfelt, conscious that his influence was waning, after a secret interview with young Gustavus, departed as ambassador to Naples. There he entered into correspondence with certain parties in Sweden for the purpose of overthrowing the regency. The plot was discovered. Armfelt fled to Poland, and afterwards to Russia. He was condemned, during his absence, for high treason, and stripped of his goods and titles, while one of his associates, the beautiful Countess Rudensköld, was subjected to the most brutal punishment. In 1799 Gustavus IV. received the crown at the age of eighteen, and Armfelt was restored to all his honours. Next in 1809 Gustavus was deposed, the ex-regent elected in his place, and

Armfelt appointed president of the Military Council. But shortly after, being implicated in the poisoning of the Prince of Augustenburg, he was obliged to flee to Russia, where, having received high honours, he died in 1814. See his *Autobiography* (Stock. 1830).

Armida, in Tasso's *Jerusalem Delivered*, was a very beautiful sorceress, employed to seduce Rinaldo, and other Crusaders, as they approached the Holy City. Her witchcraft was after a struggle overcome by Rinaldo, who then confessed his love to her, and persuaded her to become a Christian.

Armillary Sphere (Lat. *armilla*, 'a ring'), an instrument intended to give a just conception of the constitution of the heavens, and of the motions of the heavenly bodies, as seen by an observer on the earth. It consists of a number of rings fixed together so as to represent the principal circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. It was by means of such rings furnished with sights that Hipparchus, Ptolemy, and other ancient astronomers made many of their observations, and we find even Tycho Brahé making most of his planetary observations with the help of such an instrument. The armillary sphere is, however, now only used as an aid to instruction in astronomy, and in this respect is generally supplanted by the celestial globe. The object aimed at in the armillary sphere will be better understood by reference to the celestial globe represented in the diagram. Supposing the observer on the earth to be in the centre of the sphere, the earth on which he stands shuts out from his view the lower half of the heavens, or the part lying below the horizon, HH. The hemisphere above him may be regarded as divided into two equal portions, an eastern and a western, by the meridian, MM, which passes through

the pole, P, and the zenith, Z, of which the eastern half is shown in the figure. The north pole is supposed to be elevated above the horizon, and its elevation is measured by the arc, NP, or the height above the north point; and the heavens appear to rotate round an axis, PQ, of which P is one extremity; the south pole, Q, the other extremity, being below the horizon. The meridian, MM, and the horizon, HH, are the only circles which maintain a fixed position with regard to the observer. Of the other leading celestial circles, the equator or

equinoctial, LL, extending from the east to the west point of the horizon, the tropics of Cancer and Capricorn, respectively BB and CC, and the arctic circle, AA, although rotating with the stars, maintain the same position with regard to the horizon; while the ecliptic, KK, is constantly changing its inclination and position towards it. Circles which extend from pole to pole, cutting the equator at right angles, are called circles of declination. The circle which passes through the vernal equinox QP (see ARIES), is denominated the equinoctial colure; and that passing through the summer solstice, O (see SOLSTICE), the solstitial colure. The circles just named, together with the antarctic circle, are represented by corresponding rings in the armillary sphere. If S be a star, the following are the names given to the arcs which determine its position with regard to these circles; QP V, right ascension; SV, declination; SP, north polar distance; SZ, zenith distance; XS, altitude; ($180^\circ + NX$), azimuth, reckoned from the south pole westward.

Arminius (Ger. *Hermann* or *Herman*), a famous prince or chief of the German tribe of the Cherusci, was born 16 B.C. In the years from 9 B.C. to 4 A.D., Drusus and Tiberius had penetrated into the north-west of Germany as far as the Elbe, laid out a number of military roads, erected fortresses in the country, and reduced the different tribes to such dependence upon Rome as virtually amounted to complete subjugation. The Germans continued to all appearance on the best terms with the Romans, gradually adopted Roman habits, and frequently and readily took service in the Roman armies. Thus Arminius and his brother Flavius had enrolled themselves under the Roman standards, and, as leaders of Cheruscan auxiliaries, had not only obtained Roman citizenship and the rank of knighthood in the country of the Danube, but had likewise acquired a knowledge of the Latin language, and a deep insight into the arts of war and policy as practised by the Romans. When Arminius returned home, he found the state of affairs considerably changed for the worse, through the unskilful despotism of the Roman viceroy, Quintilius Varus. He now conceived the plan of delivering his country from its oppressors. All the tribes and leaders as far as the Elbe were secretly summoned; Varus was lulled into security, and induced to despatch portions of his army to different points, and, with the remaining portion, consisting of three legions and some auxiliaries and cavalry, to quit the highway. He was thus lured into the impassable districts of the *Teutoburg Forest*, in the north of Westphalia; an engagement took place, probably near Detmold, which lasted for three days. The result was the annihilation of the whole Roman army (9 A.D.). When intelligence of this defeat reached Rome, it excited the greatest consternation and anxiety. Augustus, who was now old and weak, is said to have yielded to transports of grief, repeating the words, 'Varus, Varus, give me back my legions!' The Germans, who had only their own liberation in view, prosecuted their victory no further; but when Germanicus (q.v.) assumed the command on the Lower Rhine, he resolved to crush the barbarians. In two successive campaigns, 14 A.D. and 16 A.D., he reduced Arminius to great straits; but he being recalled to Rome by the Emperor Tiberius, 17 A.D., the results of his victorious activity were lost. From this time no Roman army ever ventured to penetrate from the Rhine into the interior of Germany; and this result must be ascribed chiefly to the Cheruscan prince. Nevertheless, no sooner was the foreign enemy expelled, than internal feuds broke out, in the course of which Arminius was slain by his own kinsmen, in the 37th year of his age and twelfth of his leadership.

Compare Massmann, *Arminius* (1839); Wietersheim, *Der Feldzug des Germanicus* (1850); Böttger, *Hermann der Cheruskerfürst* (1874).—A colossal statue of Arminius, by Bandel (q.v.), placed on a hill near the town of Detmold, was unveiled in August 1875.

Arminius, JACOBUS, or JAKOB HARMENSEN, the founder of Arminianism, was born in 1560, at Oudewater, in South Holland. After a preliminary education at Utrecht, he commenced (in 1575) a course of study at the newly founded university of Leyden, where he remained for six years and acquired a high reputation. In 1582 he went to Geneva, and received the instructions of Theodore Beza (q.v.), a rigid Calvinist. Here he made himself unpopular by the boldness with which he defended the logic of Peter Ramus (q.v.), in opposition to that of the Aristotelians of Geneva, and in consequence had to retire to Basel, where he was offered the degree of doctor of Divinity. At Basel he studied under Gryneus. In 1586 he travelled into Italy; and on his return to Amsterdam (1588) he was ordained a minister. Shortly after this he was commissioned to defend the doctrine of Beza, regarding predestination, against the changes which the ministers of Delft had proposed to make on it. Arminius carefully examined both sides of the question, but the result of his study was, that he himself began to doubt, and at last came to adopt the opinions he had been commissioned to confute. Soon after, in the course of his exposition of the Epistle to the Romans, his treatment of the 8th and 9th chapters involved him in sharp disputes with his orthodox brethren. Still his views had not attained to that definiteness they subsequently acquired, for in 1603 he was made professor of Theology in the university of Leyden.

The chief opponent of Arminius was Francis Gomar (q.v.), his colleague in the university of Leyden. In the course of the year 1604, the latter attacked his doctrines, and from that hour to the end of his life, Arminius was engaged in a series of bitter disputes with his opponents. Arminius asserted, in substance, that God bestows forgiveness and eternal life on all who repent of their sins and believe in Christ; he wills that all men should attain salvation, and only because he has from eternity foreseen the belief or unbelief of individuals, has he from eternity determined the fate of each. On the other hand, Gomar and his party, appealing to the Belgic Confession and the Heidelberg Catechism, maintained that God had, by an eternal decree, predestinated what persons shall, as being elected to salvation, be therefore awakened to repentance and faith, and by grace made to persevere therein; and what persons shall, as being rejected (*reprobati*), be left to sin, to unbelief, and to perdition. See PREDESTINATION, PERSEVERANCE OF SAINTS.

While these fierce disputes were continuing, Arminius, who was not destitute either of friends or influence, was created *rector magnificus* of the university, but resigned the honour on the 8th of February 1606, having held the office only for one year. All the pulpits in Holland now thundered against him. At length, in 1608, Arminius himself applied to the States of Holland to convoke a synod for the purpose of settling the controversy; but, worn out with care and disease, he died on the 19th of October 1609, before it was held, leaving seven sons and two daughters.

There can be no doubt that Arminius himself was much less Arminian than his followers. He had not matured his opinions sufficiently to elaborate a complete system of anti-Calvinistic doctrine, though it is perfectly certain that the conclusions at which his disciples arrived—as stated in the famous 'Five Articles'—are the logical and legitimate results of

his teaching. Personally, Arminius was a faithful pastor and a good man, as even his enemies allow; his abilities were also of a high order; his thinking is clear, bold, and vigorous; his style remarkably methodical, and his scholarship respectable, if not profound.

After his death his followers gained strength, and boldly asserted their views, but still remained in a minority. In 1610 they presented to the assembled States of the provinces of Holland a 'Remonstrance'—from which they were styled 'Remonstrants'—which contained the following propositions: (1) That God had indeed made an eternal decree, but only on the conditional terms that all who believe in Christ shall be saved, while all who refuse to believe must perish; so that predestination is only conditional. (2) That Christ died for all men, but that none except believers are really saved by his death. The intention, in other words, is universal, but the efficacy may be restricted by unbelief. (3) That no man is of himself able to exercise a saving faith, but must be born again of God in Christ through the Holy Spirit. (4) That without the grace of God, man can neither think, will, nor do anything good; yet that grace does not act in men in an irresistible way. (5) That believers are able, by the aid of the Holy Spirit, victoriously to resist sin; but that the question of the possibility of a fall from grace must be determined by a further examination of the Scriptures on this point.

This last point, left as an open question, was decided by the Remonstrants in the affirmative soon afterwards (1611). Whereupon the Gomarists (Calvinists) put forth a strong 'Counter-remonstrance,' asserting plainly absolute predestination and reprobation. After several fruitless discussions, the States of Holland, in January 1614, issued an edict of full toleration for both parties, prohibiting at the same time the continuance of the controversy. The Counter-remonstrants refused to submit to this edict, and the strife soon became so furious, that in 1617, or soon afterwards, the Arminians found it necessary to guard themselves from personal violence by appointing a safeguard of militia-men (*Waardgelders*). The controversy now merged in the strife of party politics. The ambitious Maurice of Orange took advantage of the passions of the majority to crush his opponents of the republican party, whose leaders were adherents of the Arminian doctrines. Several Arminians were put to death, and others were imprisoned (Oldenbarnevelde, Grotius). In these circumstances, the Synod of Dort was held (1618-19), attended by selected representatives from the Netherlands, England, Scotland, the Palatinate, Switzerland, Nassau, East Friesland, and Bremen. From this convocation (January 14, 1619) the thirteen Arminian pastors, with the learned and eloquent Simon Episcopius at their head, were excluded. The doctrines of the Counter-remonstrants were embodied in ninety-three canons; the Belgic Confession and the Heidelberg Catechism were confirmed as authorities for the reformed churches of the Netherlands; and three hundred Arminians (chiefly preachers) were expelled from office. In consequence of this decision, the defeated party sought shelter abroad, but under Maurice's successor (1630) they were again tolerated in Holland.

Since that time, the Remonstrants (or Arminians) in Holland have inclined more and more towards freedom of thought on religious questions, and independence in church government. The rejection of all creeds and confessions; the free interpretation of the Scriptures; a preference of moral to doctrinal teaching; Arian views respecting the Trinity; the virtual rejection of the doctrines of original sin and imputed righteousness; and the view of the sacra-

ments as merely edifying forms or ceremonies—all these and other points of belief display the same tendency which is found in their church polity. The number of Remonstrants is now only about 5000, and is still decreasing. In 1809 they had 34 congregations with 40 preachers in Holland; but in 1880, only about 20 congregations. The largest society of Arminians is in Rotterdam, and numbers only 600 members.

Although the Arminians are thus dwindling away as a distinct body, their tenets respecting predestination have been adopted with greater or less modification by several other Christian denominations (see METHODISTS, BAPTISTS, MORISONIANISM); as well as by multitudes of the individual members of those churches whose formularies are Calvinistic (see CALVINISM). Arminian influence became marked in the Church of England after Laud's time (see LATITUDINARIANS, HALES); and a decided aversion to the harsher aspects of Calvinistic doctrine is characteristic not merely of the Broad Church, but of what is often called modern theology. Arminian views are also very prevalent in the Church of Rome. Most of Arminius's works have been published in Nichols's translation, and Brandt's Life of Arminius has been translated into English by Guthrie (1854).

Armistice, a temporary suspension of hostilities between two armies, or two nations at war, by mutual agreement. It takes place sometimes when both are exhausted, and at other times when an endeavour to form a treaty of peace is being made.

Armisticio, a territory of Venezuela, with an area of 7040 sq. m. It is bounded by the Venezuelan states of Los Andes, Zamora, and Bolivar, and on the S. and W. by the United States of Colombia. Armisticio is fertile and abundantly watered, several important tributaries of the Orinoco, with their numerous affluents, intersecting the territory in all directions; and, with the increased facilities for transport, greater quantities of its products are annually finding a market.

Armitage, EDWARD, an English historical and mural painter, was born in London, May 20, 1817, and studied in Paris, where in 1842 he exhibited his first independent work. In the following year his *Landing of Cæsar* gained a prize of £300 in London; and in 1845 and 1847 he carried off prizes of £200 and £500. After a year's study at Rome, he visited the Crimea during the war, and on his return produced two spirited battle-pieces. He was made an associate in 1867, and in 1872 a fellow of the Royal Academy, to which, in 1875, he was appointed lecturer on painting. Most of his contributions to the Academy exhibitions have been scriptural subjects; all have been marked by powerful composition, and by a breadth and boldness that largely atone for a want of warmth in the colouring. His mural paintings include a series of noble figures of Christ and the twelve apostles, executed for a Roman Catholic church in London.

Armorica (Celt. *are-mor*, 'before the sea'), the country of the Armorici, who, in Cæsar's time, occupied the coast of Gaul between the Seine and the Loire. Later the name was confined to Brittany (q.v.).

Armour is a general term for the apparatus of personal defence, as distinguished from arms or weapons of offence. The commonest implement of defence in prehistoric and early historic times in Europe was the shield. The earliest known shields are of bronze, and circular, and were held in the left hand by a handle under the central boss. In addition to the shield, the early Greeks used greaves and helmets of bronze, and to these, in later times, a cuirass of breast and back plates was

added. The Romans added shoulder-guards to the cuirass, which was modelled to the bust, and furnished with a series of pendent plates, reaching almost to mid-thigh. It is not known when the tunic of interlinked rings, or coat of mail, first made its appearance in Europe. Flexible cuirasses were worn by the Roman *Hastati*, but there is no distinct evidence of their construction. Portions of

was bound to have as many coats of fence (*lorica*), helmets, shields, and lances, as he had knights' fees in his domain; and the freemen and burgesses were to have habergeons or *gumbesons*, and iron caps. The Scots had not generally adopted the use of defensive armour, for at the battle of the Standard, in 1138, the Earl of Strathearn is represented as saying: 'I wear no armour, yet they who do will not advance beyond me this day.' Towards the end of the 12th century, the round shield becomes rare, and the kite-shape gives way to the triangular or flatiron-shaped shield, and the conical helmet to the cylindrical and flat-topped form. In the first part of the 13th century, the hauberk and hose, or long *chausses* of mail, remained the usual body-armour of the knight; but in the second half of the century, the mail defences of the limbs began to be reinforced by portions of plate attached as shoulder-pieces, and elbow and knee pieces, to which were speedily added greaves or shin-pieces. The hauberk was made, in the beginning of the century, with a continuous coif for the head, and gloves not divided into fingers, but having an aperture in the centre of the palm. The coif of mail, which at the commencement of the 13th century was flat-topped, became round-topped in the second half of the century, and instead of it, the hood of mail, with a wide tippet which fell over the hauberk on the shoulders, was coming into use. Over the coif or hood, the great helm was worn in action, completely encasing the head, and perforated in front with small apertures for light and air. In the early part of the century, the cylindrical, flat-topped helm was the common form; in the middle of the century, the round-topped form prevailed; and by the end of the century, the top had assumed more of the form of a sugar-loaf. The armour was also extended from the man to the horse, which had a couverture of chain-mail fitting tightly to the head and neck, and falling loosely over the body.

The 14th century was the period of the greatest development of body-armour, marking the transition from the coat of mail to the panoply of plate. The knightly equipment at this period necessitated the wearing of four or five different casings or defences over each other. Below the chain-mail, which was still worn, the quilted gambeson was needed to soften the pressure; over the mail was the corselet, with other reinforcements of plate, and over all, a second quilted garment, which might or might not be covered by the surcoat, usually worn uppermost for the purpose of displaying the knightly emblazonment. The hauberk now terminates at the neck, which is defended by a gorget of scale or plate. An ample corselet protects the breast, and the shoulders, elbows, and hands have each their special defences, either of articulated plates or single pieces. The reinforcements to the chausses or hose of mail which protected the legs in the previous century, gradually give way to complete defences of plate, the greaves fitting to the knee-pieces, and these to the thigh-pieces, till in the latter part of the century the legs were completely incased in tubular *jambards*, or jointed casings of plate, which opened upon hinges on the outside of the leg, and fastened on the inside. The feet were inclosed in *sollerets*, or shoe-like casings, of articulated plates, the long-pointed toe of the *solleret* marking the second half of the century. Under the pointed or dome-topped helm, the coif or hood of chain-mail is discarded for the *bassinet*, a high-peaked cap of steel, round the lower part of which is laced the upper edge of the *camail* or tippet of chain-mail falling down over the neck and shoulders. The helm, when placed over the *bassinet*, completely covers the head and face; it is perforated with clusters of small holes for breathing,

Fig. 1.—From Brass of Sir John de St Quintin, 1397: Fig. 2.—Complete Suit of Plate-armour, beginning of 16th Century:

- 1, helmet; 2, visor; 3, gorget; 3a, camail; 4, breastplate; 5, skirt; 6, arm-pieces; 7, elbow-piece; 8, gauntlet; 9, hauberk; 10, thigh-piece; 11, knee-piece; 12, greaves; 13, sollerets; 14, lance-rest; 15, belt.

chain-mail, formed of small riveted rings interlinked together, have been found in the mosses of Sleswick, associated with articles of decoration, exhibiting the influence of Roman art of about the 3d century. It seems unquestionable that chain-mail was in general use among the Northern nations long before the crusades. The enthusiasm engendered by the Holy Wars, however, gave a general impetus to the adoption of this species of personal defence, and under the feudal system, which prescribed for every man the arms and armour conformable to his condition, the period of the principal development of body-armour was reached. Disregarding the equipment of the common mass of combatants—which generally consisted of a suit of leather or other material quilted or stuffed, or padded with cotton or waste, or studded or masced with small plates or scales of iron—the suits of armour worn by the knights and nobles were of costly workmanship, and splendidly adorned. In armour, as in dress, the changing fashions of the different periods are strongly marked. At the time of the Norman Conquest of England, or about the middle of the 11th century, the armour consisted of a *hauberk* or tunic of mail for the body, hose of mail for the legs, a conical helmet with nasal, and a circular or kite-shaped shield. This continued to be the style of equipment throughout the 12th century. By the assize of arms of Henry II. in 1181, every knight

and for sight is furnished with a narrow cleft extending from temple to temple. Before the close of the century, the visored bassinet and camail were often used instead of the unwieldy helm. The shields were still triangular, but shorter than in the previous century. On the shield and surcoat were emblazoned the wearer's armorial bearings, and the military belt of this period, which confined the lower part of the surcoat, was often the most brilliant and costly part of the equipment, formed of elaborately worked plaques of precious metals, jewelled or enamelled, and furnished with pendants. The horses were almost as closely clad in plate as their riders; and in consequence of the weight they bore, a fall was often fatal to them both. In the 15th century, the development of plate-armour proceeded until, towards the middle of the century, body and limbs were completely enveloped in an articulated casing of iron plates.

Fig. 3.—Suit of Armour presented by the Emperor Maximilian to Henry VIII., showing the Horse-armour.

Articulations fitted to the upper parts of the arm-plates were carried over the shoulders, and the joints were protected by fan-shaped projections. The body, below the breast and back plates, was enveloped in a skirt of wide, hoop-like plates called *tassets*. To the lower part of these there were attached a series of more loosely hanging plates called *tuilles*. The leg defences are angular in front, the long-pointed toes of the sollerets are shortened, and the gauntlets formed with articulating plates down to the points of the fingers. The bassinet and camail are being discarded in favour of the *salade*, a species of skull-cap, worn with a gorget and chin-piece separate from it. In this century, the introduction of gunpowder marks the period from which body-armour began to decline in importance, as being no longer proof against the new weapons of attack. The whole system of warfare was changed, tactics took the place of chivalry, and fortification of strong places against artillery superseded the system of iron-clad men. The full panoply of armour was still kept up for the joust and the tournament, but for actual service the tendency was henceforth in the direction of its disuse. In the 16th century, so prolific in changes, there was no longer the same uniformity of equipment. Instead of the long encircling skirt of hoop-like *tassets*, with *tuilles* attached, there is now a shortened skirt with a series of sliding and overlapping plates depending over each thigh, from the waist to the knee. The head defences are visored helmets or *salades* and morions. In the 17th century, officers and pikemen still retained the cumbersome body-suit of breast and back plates, with the short skirt of *tassets* and thigh-pieces; and in the 18th century, body-armour had been reduced to a mere embellishment of the military parade.

The most authentic sources of information as to the changing fashions of body-armour in the middle

ages, are the miniatures of the illuminated manuscripts previous to the invention of printing, the Bayeux tapestry, and the monumental effigies and brasses of parochial and cathedral churches. The works of Grose, Meyrick, and Skelton may be consulted, or Hewitt's *Ancient Armour and Weapons in Europe*.

Armourer, formerly an armour-smith or maker of armour; now a skilled gunsmith in charge of the rifles, swords, and bayonets of the British army or navy. Each regiment of cavalry, battalion of infantry, and brigade of artillery has an armourer-sergeant who has been trained to clean and repair rifles and bayonets at the Small Arms Factory, Enfield. Should the introduction of a new weapon render it necessary, armourer-sergeants return to the same place for a further course of instruction. Every rifle in the possession of the regiment is inspected by them at least once a year, and put in order.

In the navy, the armourer is a first-class petty officer, who has, under the gunner, charge of all the rifles, pistols, sword-bayonets, &c., which he keeps clean and in order. He is assisted by seamen called the 'armourer's crew'; and all are skilled in the general routine of smith's work.

Armour-plates. See IRONCLADS.

Armpit, technically called the *axilla*, is the term applied to a space or hollow situated between the inner aspect of the arm and the upper part of the chest-wall. In shape it is pyramidal, the apex being directed upwards and inwards towards the root of the neck, while the base is directed downwards and outwards. The skin covering the base is characterised by its dark colour and the presence of hairs and sweat-glands of large size. The extent or depth of the space varies according to the position of the arm, being greatest when the arm hangs by the side, but gradually diminishes as the arm is elevated. In the latter position, the fore and hind boundaries become prominent borders, and are called the *axillary folds*. The large vessels and nerves for the supply of the upper limb pass through the space from apex to base, lying in close relation to the outer wall, and thus they are well protected from injury. Lodged in the space there are numerous lymphatic glands. These are apt to become inflamed, and lead to the formation of abscesses which, from the large size of the space and the resistant character of the tissues forming its base, may attain considerable proportions.

Arms, ARMORIAL BEARINGS, or ENSIGNS, devices borne on shields and banners by families, or by kingdoms, provinces, episcopal sees, or corporate bodies. See HERALDRY.

Armstrong, JOHN, physician and poet, was born about 1709 at Castleton, a pastoral parish in Liddesdale, Roxburghshire, of which his father was minister. He took the Edinburgh degree of M.D. in 1732, and soon after commenced practice in London. In 1736 he published a nauseous poem, *The Economy of Love*; in 1744 his principal work, *The Art of Preserving Health*, a didactic poem in four books. In 1746 he was appointed physician to the London Hospital for Sick and Lame Soldiers, in 1760 physician to the forces in Germany, whence he returned on half-pay in 1763, to resume practice. With Fuseli, the painter, he made a continental tour (1771); and he died from a fall in London, 7th September 1779. The friend of Thomson, Mallet, Wilkes, and other wits and writers of the day, Armstrong seems to have been a reserved, indolent, and splenetic man, 'who quite detested talk'; kind-hearted withal, and of frugal habits, having left £3000, saved out of a small and precarious income. His fame rests entirely on *The Art of Preserving Health*; his other works—

Benevolence (1751), *Taste* (1753), *Sketches or Essays* (1758), *Day* (1761), *Miscellanies* (1770), *A Short Ramble through France and Italy* (1771), &c.—being now only known by name.

Armstrong, JOHN, physician and medical writer, was born 8th May 1784, at Ayres Quay, near Bishop-Wearmouth, where his father was superintendent of glass-works. He graduated M.D. at the university of Edinburgh (1807), commenced practice at Bishop-Wearmouth, in 1811 was chosen physician to Sunderland Infirmary, and, having greatly extended his reputation by a work on *Typhus* (1816), in 1818 removed to London, where his practice became extensive, and where, from 1819 to 1824, he was physician to the Fever Hospital. He died of consumption, 12th December 1829. See his *Life* by Dr Boott (2 vols. 1833).—His son, **JOHN ARMSTRONG** (1813–56), in 1853 became Bishop of Grahamstown.

Armstrong, WILLIAM GEORGE, LORD ARMSTRONG, inventor of the Armstrong gun, was born in 1810 at Newcastle, where his father was a merchant. He was articled to a solicitor, and became a partner in the firm. But the bent of his mind lay in other directions. In 1840 he produced a much improved hydraulic engine, and in 1845 the hydraulic crane. In 1842 he brought to perfection an apparatus for producing electricity from steam. He was elected a member of the Royal Society in 1846; and shortly afterwards commenced the Elswick Engine-works, in the suburbs of his native city. This large establishment was at first chiefly employed in producing hydraulic cranes, engines, accumulators, and bridges, but was soon to be famous for the production of ordnance. During the Crimean war, Armstrong was employed by the War Office to make explosive apparatus for blowing up the ships sunk at Sebastopol. This led him soon afterwards to consider improvements in ordnance, and he devised the form of cannon that bears his name. The essential feature of the Armstrong gun, whether rifled or smooth bore, breech-loading or muzzle-loading, is that the barrel is built up of successive coils of wrought-iron, welded round a mandrel into a homogeneous mass of great tenacity, the breech being specially strengthened on similar principles. The actual results obtained by these guns, even of the earlier patterns, were almost incredible. An ordinary 32-pounder weighed 57 cwt.; Armstrong's 32-pounder weighed 26 cwt. The former required 10 lb. of powder as a charge; for the latter 5 lb. sufficed. The former would send a shot or shell 3000 yards; the range of the latter exceeded 9000 yards. In 1858 the Rifle-cannon Committee recommended the adoption of the Armstrong gun for special service; and the government proposed to secure the result of these experiments for the nation. Armstrong offered to the government all his inventions; and, till 1863, there existed a kind of partnership between the government and the Elswick firm, Armstrong being knighted in 1858, and appointed Chief-engineer of Rifled Ordnance. The Elswick firm, which in 1888 employed more than 13,000 workmen, has since supplied many foreign governments with guns.

The great reputation and commercial success of Armstrong depended, however, largely on his skill as a constructor of hydraulic machinery. Already a member of many scientific societies, he was in 1863 president of the British Association; and was instrumental in bringing about the appointment of the Coal Commission in 1866. He also took an active part in the inquiries concerning the operation of the Patent Laws. Cambridge and Oxford have conferred honorary degrees on Armstrong, who is a member of several foreign knightly orders.

In 1887 he was raised to the peerage as Baron Armstrong.

Army, a body of armed men, so organised and disciplined as to act together, be mutually reliant, and perform in unison the evolutions of the march and battlefield according to the absolute will of one man. An army is a movable engine composed of a vast number of individual parts or powers, arranged so as not only to act in concert, but to exert their whole aggregate force in any direction and upon any point which may be ordered or required. The organisation of an army is of two kinds, tactical and administrative. The former enables the leader of an army to transmit his orders to three or four subordinate commanders, who pass them on to three or four others under them, until, through a regular chain of responsibility, the original impulse is communicated to the private soldier (see **TACTICS**). The latter, in a similar manner, divides the army into groups of gradually decreasing size, so that the men may be efficiently paid, fed, clothed, and armed (see **ARMY ADMINISTRATION**). The present article will treat only of the constitution and establishment of armies, and indicate their gradual historical development. Technical terms generally, as well as all the component elements of the army, in *personnel* and *matériel*, and the organisation and duties of the troops, will be found noticed under their proper headings; the tactical positions of an army are defined below.

Ancient Armies.—The earliest regular military organisation is attributed to Sesostris, who flourished in Egypt about sixteen centuries B.C. This extraordinary conqueror divided Egypt into thirty-six military provinces, and established a sort of militia, or warrior caste, to each member of which he allotted lands for the support of himself and his family. With this army he overran Asia as far as India, and from the Ganges to the Caspian. After him, little further progress was made in military art until the Persian empire arose. Its soldiers introduced the mass-formation, with cavalry in intervals of squares; but the most important feature of the Persian organisation was the establishment of what was practically a standing army, divided as garrisons throughout the conquered provinces, and under the control of military governors distinct from the satraps. In time of war this standing army was augmented by a general levy which included the tributary nations, and therefore resulted in a heterogeneous collection of barbarous and undisciplined peoples; a source of weakness which caused the defeat of Xerxes' numerically powerful army. In Greece, it was not a standing army, but a sort of national militia, that gained Marathon, Plataea, and Mycale. The leading men in each state paid attention to organisation and tactics in a way never before seen. The Lacedæmonians invented the Phalanx (q.v.), a particular mass-formation for foot-soldiers; and to this the Athenians added lighter troops to cover the front and harass the enemy in march. Their cavalry also were efficient and alert. The charge of the Athenian army at Marathon showed the crowning excellence of their rapid system of attack; and Miltiades, their leader, is said to have first invented the 'double step,' to increase the momentum of a phalanx when rushing on the enemy. The Thebans introduced the column formation, which, being deeper and narrower than the phalanx, was intended to pierce the enemy's line at some one point, and throw them into confusion. Philip, the father of Alexander the Great, established in Macedonia the world's second standing army; and, as a further change, made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use

the Macedonian pike, a formidable weapon 24 feet in length. With a phalanx sixteen ranks in depth, six rows of men could present the points of these long pikes protruding in front of the front rank, forming a bristling array of steel terrible to encounter. Meanwhile, a more western power was developing what was perhaps the most perfect organisation in the annals of military history. The Romans initiated changes in army matters which have had a widespread influence throughout the civilised world. About the period 200 B.C., every Roman, from the age of 17 to 46, was liable to be called upon to serve as a soldier; the younger men were preferred, but all were available up to the middle-time of life. They went through a very severe course of drill and discipline, to fit them alike for marching, fighting, camping, working, carrying, and other active duties. Every year the magistrates sent up the names of eligible men, and tribunes selected a certain number from this list to form Legions (q.v.), or army corps. The Roman legion, in its best days, excelled all other troops alike in discipline and in *esprit*. So long as none but freemen were enlisted, the position of a legionary was one of honour; but when it became necessary to supply the armies of ambitious leaders with large drafts of slaves and criminals, the character of the body naturally fell with that of the individual. With a gradual laxity in discipline, the decline of the Roman power commenced. The under-current of insubordination resulted in reverses, and though discipline was revived spasmodically under great commanders, it ultimately died out.

Medieval Armies.—With the decline of the Roman power, all that remained of scientific warfare was lost for a time. The northern invaders made little use of tactics, but relied chiefly on their personal bravery, and on the impetuosity and weight of their attack in column. The army, among the Franks and Germans, was the nation. Every freeman bore arms, alike as a duty and as a privilege. Kings and generals were intrusted in time of war with an absolute power, which the nation resumed with the return of peace. The conquerors of the Roman empire at first recognised no superior save the community, of which all conquests were the property. What all had aided to acquire, all demanded equally to share. Hence arose a division of the conquered territory, individual chiefs rewarding their own followers with gifts of the lands they had helped to conquer. The growth of a feeling that such gifts could be revoked, and that they implied an obligation to future service, marks the beginning of the Feudal System (q.v.), under which national armies disappeared, and each baron had a small army composed of his own militia or retainers, available for battle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the middle ages. Of military tactics or strategy there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valour than by any well-concerted plan. The characteristics of the system most strongly opposed to the progress of military science were the undue importance attached to the cavalry, the want of organisation, resulting from the numerous rival commands which made up its armies, and the shortness of the service, extending only to twenty days, or at the most, three months in every year. The Crusades (q.v.) effected some improvement in all these respects. The forces which went to the Holy Land were at first mere armed mobs, upheld by fanaticism, but ignorant of all discipline, and under leaders destitute alike of forethought and powers of combination. The reverses they

sustained, however, showed the necessity for some organisation, and the extended service called attention to and developed the value of the foot-soldiers. From this period dates the modern recognition of the importance of an arm which increased under the franchise extended to the towns, and the superiority of which, since the overthrow of the Burgundian chivalry by Swiss infantry in the three disastrous battles of 1476-77, has never been disputed. The invention of gun-powder effected much less change, during the middle ages, than is generally supposed. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valour, everything connected with the military art underwent a revolution. Historically, however, this great change was not very apparent until after this period. The art of making good cannon and hand-guns grew up gradually, like other arts; and armies long continued to depend principally on the older weapons—spears, darts, arrows, axes, maces, swords, and daggers. As to army-formation, there was still little that could deserve the name; there was no particular order of battle; each knight sought how he could best distinguish himself by personal valour; and sometimes it happened that the fate of a battle was allowed to depend on a combat between two knights. No attempt was made, until towards the close of the 15th century, to embody a system of tactics and manœuvres for cavalry; and even that attempt was of the most primitive kind. Nor was it far otherwise with the foot-soldiers; they were gradually becoming acquainted with the use of firearms; but, midway as it were between two systems, they observed neither completely; and the armies in which they served presented very little definite organisation.

Modern Armies.—The Turkish Janissary force (q.v.), the earliest standing army in Europe, was fully organised in 1362; but the formation of standing armies among western powers, which may be said to have introduced the modern military system, dates from the establishment of *compagnies d'ordonnance* by Charles VII. of France, nearly a century later. These companies of men-at-arms amounted, with their attendants, to 9000 men; and to them the king afterwards added 16,000 franc-archers, largely recruited from the mercenaries which growing wealth and luxury had developed. The superiority of such a force over militia forced its adoption on the surrounding states. Monarchs contracted with powerful nobles to raise, by enlistment, regiments, which were now broken up into squadrons or battalions as tactical units, the regiment remaining the administrative unit. Between the beginning of the 16th and the end of the 18th centuries, the proportion of musketeers gradually increased; the pike was abandoned for the bayonet, and even the cavalry were taught to rely more on their fire than on the effect of their charge. The improvements in weapons naturally affected the formation. During the Thirty Years' War (1618-48), Gustavus Adolphus and Wallenstein adopted opposite modes of dealing with masses of infantry; the former spread them out to a great width, and only six ranks in depth; whereas the latter adopted a narrower front, with a depth of twenty to thirty ranks. In Louis XIV.'s reign, the prolonged wars introduced the larger grouping in brigades and divisions. Frederick the Great, in the next century, reduced the depth of his infantry formation to three ranks, and introduced a most rigid and exact system of tactics and drill; so that when able to manœuvre, he nearly always won his battles; but when the result depended on bold and unexpected onslaughts, he was more frequently a loser than a winner. He, however, greatly

improved the cavalry tactics, and restored to this arm a reliance on the effect of a rapid charge, while the introduction of horse artillery added to its power.

The French Revolution effected almost as great changes in the military as in the political organisation of Europe. The struggle from which France emerged victorious in 1797 had exhausted even the enormous levies which had fed her armies for the previous five years; and in 1798 a law was passed establishing compulsory military service. Every citizen was declared liable to five years' service, and all between the ages of 20 and 25 were enrolled. The immense advantage which this terrible power gave Napoleon, compelled other nations to follow the example of France, and in Europe voluntary enlistment has since survived in England alone. From this period also dates the introduction of the short service and reserve system. Restricted under the Treaty of Tilsit (1807) to 43,000 men with the colours, the Prussian strength was nevertheless annually added to by Scharnhorst, who first developed the idea of sending the trained soldiers back to their homes at the end of the year, and replacing them with fresh recruits; and thus, while keeping the establishment within the required limits, producing a powerful and steadily growing reserve. In spite of the strength which Prussia mustered under Blücher, however, the teaching of Sadoua and the events of 1870 and 1871 were required to induce the other powers to follow her example. Now, in most nations will be found an Army of Reserve, intended to augment the standing army, or first fighting line, from a peace to a war strength, and consisting of two classes—those waiting for an immediate call to arms, if required, and those constituting the militia or second line of reserves—the entire effective military power of the state (see MILITIA, LANDWEHR, the latter dating from 1813). The principles of organisation were also modified in the large armies which took the field in the beginning of the century. In 1792, *mixed divisions*, composed of all arms, had been introduced, and in 1804 Napoleon organised, under his marshals, *corps d'armée*, each in itself a complete army. The Prussian model has been accepted as the best type of Army Corps (q.v.), and in that country originated also the territorial system now generally adopted by all European powers. A modern army, when mobilised, consists of several such corps, and a mass of cavalry, placed under one commander. A smaller force taking the field, consisting of one corps or less, is generally called an *expeditionary force*. It should perhaps be added that a *corps d'armée* takes up on the line of march from 20 to 30 miles; the actual rate of marching may be stated at from 1 to 2 miles an hour, even this rate being dependent on the state of the roads and any circumstances (such as an excessive proportion of guns) that may impede a column of march.

It may be convenient to mention here certain distinctions in the application of the word 'army.' A *Covering Army* is encamped or in cantonments, for the protection of the different passes or roads which lead to the town or other place to be protected. A *Siege Army* is ranged around or in front of a fortified place, to capture it by a regular process of besieging. A *Blockading Army*, either independent of or auxiliary to a siege army, is intended to prevent all ingress and egress at the streets or gates of a besieged place. An *Army of Observation* takes up an advanced position, and by celerity of movement keeps a close watch on all the manoeuvres of the enemy. An *Army of Reconnaissance* has a more special duty at a particular time and place, to ascertain the strength and position of the

enemy's forces. A *Flying Column* is a small army carrying all its supplies with it, so as to be able to operate quickly, and in any direction, independently of its original *Base of Operations* (q.v.).

THE BRITISH ARMY.—In Anglo-Saxon times every Englishman necessarily belonged to the *fyrd*, or national militia, and the defence of the country was one of the three obligations of the *Trinoda necessitas* (q.v.). The Conquest introduced the feudal system, the kingdom being divided into some 60,000 *knight's-fees*, which carried the obligation of forty days' service a year, at home or abroad. The *posse comitatus*, under the sheriff, and the militia were also maintained. But gradually the unfitness for a long campaign of an army which so soon disbanded, brought about the substitution of an *escuage*, or fixed fine, for personal service, and armies were raised by contract with some powerful baron or experienced captain. Forced levies were illegal but common from the reign of Edward III. to that of Elizabeth, whose forces for the Irish wars were supplied by this means. Under Charles I., the important question arose whether the king of England did or did not possess the right to maintain a military force without the express consent of parliament; and the bitter feeling, when the king billeted his soldiers on the people and imposed martial law in time of peace, culminated in the presentation of the Petition of Rights (q.v.). Cromwell established a standing army of 80,000 men, mostly of the yeoman class, the most effective army, probably, that England has ever possessed; but the cost and the preponderating political influence of such a force produced finally a still deeper discontent. Consequently, on his restoration, Charles II. found himself at first compelled to agree to the abandonment of all the army except a kind of body-guard or household brigade of 5000 men, sanctioned by the parliament. Monk's Coldstream regiment and another were retained, and formed the first regiments of guards; the Earl of Oxford's Royal Regiment of Horse Guards (Oxford Blues) stood first upon the establishment, and two troops of cavalry raised by Charles formed the originals of the present Life Guards. In 1661 Dumbarton's regiment, probably the oldest in the world, was brought over permanently to England, and made the Royal Regiment of Foot. It had formed the guard of Charles of France in the 9th century, and had shared in the battles of the Thirty Years' War. Its old title of the Royal Scots has since been revived; another sobriquet, 'Pontius Pilate's Guards,' refers to its great antiquity. The Infanta of Portugal brought, as part of her dowry, Tangier and Bombay, and the king to garrison these raised other regiments, including the Queen's and the Holland Regiment, the latter long known as 'the Buffs.' Throughout the reign the establishment grew, in spite of parliament's open jealousy of such an increase; and although the Commons by holding the purse virtually held the power, Charles's army numbered at his death 16,500 men. With Monmouth's rebellion as an excuse, James II. raised its strength to 20,000, some 13,000 of whom were kept in camp at Hounslow.

In the succeeding reign the real basis of the modern British army was laid. The Declaration of Rights (q.v.) settled, in positive terms, 'that the raising and keeping of a standing army in time of peace, without consent of parliament, is contrary to law.' To punish certain offences against military discipline, which had hitherto been enforced by Articles of War emanating from the sovereign, the first Mutiny Act was passed in 1689, to last for six months only; but it was

afterwards, with a few exceptions, annually renewed until its incorporation in the Army Discipline Act of 1879 (see ARMY DISCIPLINE). In 1691 the Commons sanctioned a vote of 65,000 men, but on the return of peace in 1697 this force was reduced to 19,000; in the war of the Spanish Succession, the troops at one time numbered over 200,000, but they were again reduced, after the peace of Utrecht, to 19,000. Although the strength of the army has since steadily increased, these fluctuations have continued. The forces raised to 74,187 in 1745 were reduced to 18,857 after the Rebellion; the strength of 245,996 necessary in 1812 had fallen to 71,790 ten years after. The elasticity which permitted these enlargements and contractions was obtained by varying the number of battalions in a regiment, of companies in a battalion, or of men in a company. During the half-century which followed the last date, the actual number of regiments varied but little. Five cavalry and thirty-five infantry regiments were added in the reigns of the first two Georges; and the necessity of organising a corps of gunners for the defence of Gibraltar and other fortresses led to the formation in 1715, under the Board of Ordnance, of two companies of artillery, which received a regimental constitution the following year, although its officers were not regularly commissioned until 1741. Fifty engineer officers also were appointed in 1717; but seventy years elapsed before privates were enlisted and that arm became a corps. It was also at first under the Board of Ordnance; and hence it is that the Artillery and Engineers are still called Ordnance Corps. The outbreak of the French Revolution found the service at a very low ebb. The laurels gained in the earlier wars of the century had been tarnished in America, where two British armies had surrendered; the ranks were largely filled with pardoned criminals and released debtors; and the system of billeting caused endless complaints from soldiers and civilians alike. In the Peninsula, the army was permanently organised in divisions, and the commissariat and transport were brought to great perfection. But these services were afterwards reduced along with the army, which fell from 246,000 to 72,000, and the result was the miserable state of unpreparedness which was discovered when the strain of the Crimean war came.

Recent Changes.—This struggle revealed many defects in the organisation of the British army; but for many years little of lasting value was done towards remedying these defects, beyond an improved method of admission, by examination, of candidates for Her Majesty's commission, and some small amelioration in the position of the privates. An English military critic could still say that 'there was no such thing as a definite English brigade, divisional, or army corps organisation; if war came, the whole had to be evolved from a force of brave men with muskets or field-guns, but destitute of all else.' Other events and considerations occupied the public attention. Still, the Indian rebellion, the second and third China war, and the Abyssinian expedition, did not allow the subject to fade altogether from the public mind. So, when the mighty events of the Franco-German war of 1870-71, and the lessons to be derived from them, burst upon Europe, they fell in England upon a soil not unprepared, and acted as a great impulse towards a real reorganisation of the British army. The work since then has been kept steadily in hand by the War Office, under successive ministries, both Liberal and Conservative. Mr (afterwards Lord) Cardwell began it in 1871, under Mr Gladstone; Colonel Stanley continued it during Lord Beaconsfield's administration; and

Mr Childers, during Mr Gladstone's second tenure of office, practically completed the work, by his measure bearing date, July 1, 1881.

To Mr Cardwell is due, in the first instance, the introduction of the principle of localisation of the military forces, the linking of battalions, and the admission of short as well as long service—the first steps towards the creation of an efficient reserve—and the abolition of the purchase of commissions by officers. Long service (21 years with the colours) was previously general; but any soldier could leave at the end of 12 years. If he did not, he was re-engaged, with a penny a day extra pay, an allowance of some £3 to £5 in lieu of a free kit, and the certainty of a pension at the end of other 9 years if he conducted himself well. His pension could be increased by a penny a day for each good-conduct badge acquired during that time: thus 1s. 5d. a day was often obtained for life after 21 years' service. Short service means a period of 12 years, divided into two periods of 6 or 8 years with the colours, and 4 or 6 years in the reserve. No re-engagement is allowed, except for non-commissioned officers and a few men specially recommended as likely to make in time good non-commissioned officers. Men of the Household Cavalry, the band of the Royal Military College, the Corps of Ordnance Artificers, and boys, serve for 12 years with the colours, and are only in exceptional cases permitted to re-engage. In case of war, all soldiers are liable to be retained for an additional year, and some, generally officers' servants, are allowed to remain after the lapse of their engagement, with three months' notice.

Mr Cardwell had in view the linking of battalions, which has since been completely carried out, and the more intimate connection of the militia with their territorial regiments. The abolition of promotion by purchase was a necessary step in this plan, in order that without injury to the positions which officers had purchased in their own battalions, they might be placed on one list for promotion with those of their linked battalion. In 1871, therefore, Mr Gladstone, in the face of strong parliamentary opposition, abolished the system of purchase, and the localisation scheme was initiated by the establishment of brigade depôts.

By the new organisation the Militia came more into the foreground. The ranks are now composed of much the same material as before, but they gain by being in more direct contact with the line, and the status of their officers is improved. They are now under military law, and when opportunities occur, sit on courts-martial with officers of all branches of the service. Formerly they were nominated by the lord-lieutenant of the county; since 1871 they have been appointed, though without an examination as yet, by the Secretary for War and the Queen. Many officers now enter the army through the militia by a special examination.

In comparing the new system of linked battalions with the old regimental system, it is necessary first to remember that the infantry counted 109 regiments of the line, beside the Rifle Brigade.

Of these 109 regiments, 25 had 2 battalions.....	= 50 bat.
The 60th had 4.....	= 4 "
The remaining 83, each 1 battalion.....	= 83 "
The Rifle Brigade had 4.....	= 4 "

141 "

These were now so reorganised as to produce 71 regiments (linked battalions). Or, in other words, many of the former 109 regiments disappeared, and by uniting, in many cases, two one-battalion regiments (linking them, as it was now technically called), 71 regiments of two (or more) battalions were formed. But these did not, for the most part, remain two-battalion regiments; two or more

battalions were added from the militia. In these new regiments the first and second battalions are line battalions, except the former 60th (now King's Royal Rifle Corps) and the old Rifle Brigade, in each of which the first four battalions are regulars of the line; any subsequent battalions are militia-men. Volunteer regiments are now likewise affiliated, with the same regimental districts, to these regiments, without, however, forming parts of these regiments, or bearing consecutive numbers of battalions: thus the King's Royal Rifle Corps (the old 60th) has 10 volunteer corps, all belonging to Middlesex and London, attached to it.

The rule for these new regiments of linked line and militia would seem to demand the existence of four battalions each. In some cases, however, the *Army List* informs us that the 4th battalion is 'not yet formed.' A few, like the Queen's Own Cameron Highlanders, have only 2 battalions; others have 5, and even 6; and the old Rifle Brigade, now the Prince Consort's Own, has 9 battalions of line and militia, to which 11 volunteer battalions are affiliated.

In place of the former numbers of regiments, now no longer applicable, territorial designations were chosen in preference, and some of the old and popular names of regiments are now only preserved, in parenthesis as it were, at the side of the territorial designation; thus the Lothian Regiment (Regimental District No. 1) is also, and by preference, called the Royal Scots; the Royal West Surrey Regiment, also the Queen's; the East Kent Regiment, also the Buffs. In this way an approach to the old mode of distinction has been kept up. The regiment recruits chiefly in the territory from which it takes its title, called the 'Regimental District.' Its depot always remains in that district, and local volunteers are attached to it.

The *Army List* still shows numbers for the cavalry regiments. Nor has any attempt been made to link this arm to the Yeomanry, which falls into two districts for auxiliary cavalry, the first having its headquarters at York, the second at Aldershot. There are also, independently of Yeomanry, some Light Horse Volunteers and Mounted Rifle Volunteers, partly attached to corresponding infantry volunteer corps. Also, not linked are: the Foot Guards, the Channel Islands Militia, the Royal Malta Fencible Artillery, the two West India Regiments, the Armourer Sergeants Corps, the Commissariat and Transport Corps, and the Ordnance Store Corps. The Engineers and Artillery have had militia and volunteers attached to them more recently.

The new arrangements as to short service produce gradually for the British army an element which it long wanted—an efficient Reserve. And on the two occasions when the reserve men were called out—viz. in 1878, on a prospect of war with Russia; and in 1882, when many of these reserve men took part in the Egyptian campaign, the results are considered to have justified the anticipations conceived of this new plan. The corps of Old Pensioners, formerly the only reserve force, is now allowed to die out.

Some important steps have been taken to improve the material of which the rank and file of the army is composed. Desertion, from which the British army has suffered more than the armies of the continental powers, where the men have less facility of escape, has on the whole been rather decreasing, more especially since the abolition of bounties in 1870. 'Branding,' technically called 'marking,' with the letters D. or B. C. (Deserter or Bad Character), by tattooing with needles and Indian ink, not by burning, as was generally supposed, was abolished in the year 1879. No substitute has been found for it to prevent re-

enlistment of soldiers discharged for bad conduct; but a better class of recruits has been obtained by a slight rise in the daily pay, and desertion checked by the introduction of deferred pay, consisting of an addition of £3 for each year of a man's service, payable on going into the reserve, or otherwise completing his service. The punishment of flogging was abolished in 1880.

The distribution of regiments into divisions and army corps, which previously was wanting, has been completed, at least on paper. The actual regiments have been told off; and in 1887 it was announced that arrangements had been made for maintaining two army corps and a division (6 regiments) of cavalry at fighting strength. Thus about 66,000 men, with 180 guns, are to be ready to embark immediately on the outbreak of hostilities. These troops are independent of those already abroad; and the battalions composing these two army corps will be those next on the roster for foreign service, whose strength will not be much below the war establishment. This state of things did not exist at the outbreak of the South African and Egyptian wars. Some battalions had their complement of seasoned men; others required reserved men or volunteers from other regiments to swell their numbers. The Reserves amount to over 52,000 men, half of them trained soldiers; the other half, men from the militia reserve, who take a double bounty, and thereby render themselves liable to be called to the colours under the same conditions as the men who have served their time in the regular army. As to artillery, the militia and volunteer artillery are considered sufficiently good to garrison the home forts, but cannot provide field artillery. It is intended to have a siege-train always ready at Woolwich. Great progress has been made as to the organisation of the Transport Service, and during the recent Egyptian campaign a post-office corps was added, with much advantage to the army in the field. Experiments have been made in reconnoitring by means of captive balloons, and in transmitting information by carrier-pigeons. Field telegraphs have been used in all recent expeditions, and the telephone has been tried on outpost duty. Volunteer corps have been invited to enrol cyclists to act as orderlies and messengers, and excellent results have been obtained from preliminary experiments. The conveyance of troops by sea has also been provided for: plans for embarkation, transport, and disembarkation lie ready at the War Office, and the capacity of all steamships fit for carrying troops is known to the Admiralty. A vanguard for the First Army Corps may be said to be comprised in the garrisons of Gibraltar and Malta.

The great distinction between the British army and that of almost every other state in Europe, is that the service is *voluntary*. The subjects of the crown engage, by free choice, to serve in the army for a definite number of years. In the rare cases where forced service by ballot is obtained, it is in the militia, not the regular army (see MILITIA).

In the following table, relating to the official year 1887-88, it is shown of what component elements the British army now consists. The militia and the volunteer corps are not here included.

BRITISH ARMY VOTED FOR 1887-88.

	Home and Colonies.	India.	Total British Army.
Horse Artillery.....	1,790	1,806	8,596
Cavalry, including Household Cavalry.....	13,430	5,670	19,100
Artillery.....	21,065	10,214	31,279
Engineers.....	6,813	368	6,666
Infantry, including Foot Guards.....	87,109	53,648	140,757
Colonial Corps.....	2,981	2,981
Departmental Corps.....	6,127	6,127
	138,765	71,691	210,456

Under the column 'India' are included only those troops of the royal army which are *lent* to India, and paid for out of Indian revenues; the other military forces in that region are enumerated under EAST INDIA ARMY, all the privates of which are natives. Of the total 210,456 forming Her Majesty's forces, 7357 were officers; 17,151 non-commissioned officers, drummers, and trumpeters; and 185,948 rank and file. There were voted for the use of this army, 25,467 horses. The total cost has been estimated at £93 per head; double that of any other European soldier, but only one-third that of an American, who is the only other volunteer in the world. The total expenditure sanctioned by parliament may be given under four headings, in round numbers as follows:

Pay and Allowance of Combatants.....	£4,522,000
Auxiliary and Reserve Forces.....	2,607,200
Stores and Works of every kind.....	8,176,500
Pensions, Militia, Volunteers, &c.....	3,088,200
	£18,393,900

—being the charge for a *peace* establishment, in which, to admit of expansion for actual war, the upper ranks (which cannot be summarily created) are disproportionately large.

The total military strength of the United Kingdom—including all the various kinds of force, also the British forces in India and the colonies—comprised the following, February 1, 1887:

Regulars, including white troops in India and the Colonies.....	210,125
Army Reserve, 1st Class.....	46,781
" " 2d.....	5,600
Militia, including permanent staff and Militia Reserve.....	123,203
Yeomanry Cavalry, including staff.....	11,499
Volunteers, including staff.....	226,752
	623,960

The native army of India and the colonial volunteers could also, as in the Egyptian campaign of 1882, furnish a contingent for European operations.—See Major-general G. E. Voyle's *Military Dictionary* (Lond. 1876); Major A. Griffith's *English Army: its History, Condition, and Prospects* (1879); and 'The Army,' by Lord Wolseley, in *Ward's Reign of Queen Victoria* (1887).

ARMIES OF EUROPE.—It is desirable to present, in the most condensed form, a few statistics of the actual armies of Europe; leaving to future articles, under the names of the several countries, cities, and battlefields, all details concerning special armies and military encounters.

Germany.—By the imperial constitution of 1871, the Prussian obligation to serve in the army is extended to the whole empire. Every German capable of bearing arms must serve in the army or navy for twelve years—seven in the standing army (three with the colours, and four in the reserve), and five in the Landwehr (q.v.); or corresponding periods in the fleet and *Seewehr*. Afterwards he is enrolled in the landsturm until 42 years of age. In the infantry, however, many of the more intelligent men are subjected to only two years' training; and 'one-year volunteers' are passed into the reserve at the end of their first year, on condition of passing certain examinations, and bearing the expense of their clothing, equipment, &c. for the year. In the German organisation the territorial system is carried out thoroughly. The army consists of 18 army corps, 13 of which are Prussian; and each of these is raised, recruited, and stationed within a particular district. These corps districts are divided into divisional and brigade districts, which are subdivided into landwehr battalion districts, and these in turn into company districts, so that every village has its definite place. Each line regiment (3 battalions) draws its recruits from an allotted district, and passes its time-expired men into the landwehr

regiment (2 battalions) of the same district. After the exemptions common to all countries have been granted, the ballot allows a margin of about 10 per cent.; those who draw the fortunate numbers passing at once into the Ersatz reserve, which receives no training, but may be called on to replace casualties in the field.

France.—A law passed in 1872 enacted that every Frenchman, with a few specified exceptions, unless serving in the navy, was liable to personal service in the army, and forbade substitution. The period of liability extended to twenty years, of which five were spent in the active army, four in the reserve of the active army, five in the territorial army, and six in the reserve of the territorial army. The expense of keeping up such an establishment in peace, however, led to the division of the recruits by ballot into two classes, one of which served the full five years in the active army, while the other was sent home after six months' or a year's training. One-year volunteers were also accepted; but so many men joined in that capacity, that, in 1887, a bill was brought before the French legislature abolishing the privilege. In the same year an Army Reorganisation Bill was introduced, reducing the period of service with the colours to three years, and proposing a large addition to the establishment; the object of the changes being to materially add to the number of efficient, without increasing the military budget. By the law of 1873, France is divided, for military purposes, into 18 regions, each occupied by a *corps d'armée*, containing 2 divisions of infantry, 1 brigade of cavalry, 1 of artillery, 1 battalion of engineers, and 1 squadron of the military train, and retaining its organisation permanently in peace and in war. The corps are not permanently localised, but frequently change stations; and in time of war the region in which a corps happened to be stationed would be drawn on for reserves and stores.

Austria.—The military forces of the Austro-Hungarian empire are divided into the standing army, the landwehr, and the landsturm. All subjects are liable to service, and those exempted on physical grounds pay a fine proportionate to their means. In principle every qualified man must serve three years with the colours, four in the reserve, five in the landwehr, and, by a law passed in 1886, twelve in the landsturm, from which, in time of war, men may be drafted into the landwehr; and men who have passed through the regular army will be liable for service in the landsturm as officers or non-commissioned officers till the age of sixty. In practice, however, financial considerations cause the division of recruits into three classes: about 95,000 annually form the first class, trained as above; nearly 10,000 are drawn to supply the Ersatz reserve; and all the remainder are passed at once into the landwehr, there to serve their twelve years. The regiments of the standing army are under the control of the Minister of War for the empire, while the landwehr is controlled by the Austrian and Hungarian Ministers of National Defence. There is no permanent corps organisation, the division being the principal unit; but in war, 3 infantry divisions, with a proportion of cavalry and a regiment of artillery, would be joined to form a corps.

Russia.—Universal liability to service has been established since 1870, but, although prohibited, the purchase of exemption has hitherto been permitted, at a fixed rate of 800 roubles (about £127). The period of service is fifteen years: six in active service (two generally on furlough), and nine in the reserve. The Russian military forces are composed of regular and irregular troops, and militia, only called out to repel invasion. Every man not

in the army or reserve belongs to the militia up to his fortieth year. The country has been divided into fifteen military districts, with sub-districts and 'circles' as in Germany. The number of army corps is 17, with the army of the Caucasus (7 divisions of infantry and 1 of cavalry) in addition. The irregular troops are supplied by the Cossacks, who give military service in lieu of taxes, and comprise about 190,000 men, chiefly cavalry. The want of barrack accommodation leads to a great deal of billeting, and many men stationed in country districts see their officers only in summer, when they are assembled for training in large standing camps.

Italy.—The Sardinian law of conscription forms the basis of the Italian military system, and all are liable from 18 to 40. Substitution is allowed in the case of brothers, and one-year volunteers are accepted. Contingents are divided by lot into two classes, one enjoying unlimited furlough, and the other serving eight years in the army, four in the active militia, and the rest of their time in the local militia. In infantry regiments three, in cavalry regiments five years only are served with the colours; the remainder, as a rule, being spent on furlough. The kingdom is divided into five 'zones,' and, in direct opposition to the Prussian principle, recruits are drawn from all zones for each regiment.

Of the other military powers of Europe, the army of Belgium (1886), including the staff and all arms, rank and file, numbered 48,222 men, besides the *Garde Civique*, 30,954; Denmark (1885), 50,522, including the extra reserve of 14,000; Netherlands (1885), 65,568 in Europe, and 31,627 in the East Indies; Spain (1886), 142,455, with 39,924 in the colonies; Sweden (1886), 40,146, besides the conscription troops, 134,108, and the militia, 16,198; in Norway the troops of the line are about 12,000 in peace, and in time of war not more than 18,000 without the consent of the Storting; Switzerland (1886), 117,179, and the landwehr, 84,046; Turkey (1885), 158,959, raised by the mobilisation of March 1886 to 475,000. Details of organisation are considered under the names of the several countries; and reference also may be made to Sir Charles Dilke's *European Politics* (1887).

The following table presents an approximate comparison of the military resources of the great powers of Europe:

ARMY.		APPROXIMATE COST.	
Peace Footing.	War Footing.	All Items.	Each Man.
Austria.....302,000	1,100,000*	29,500,000	£45
France.....624,000	3,750,000	28,500,000	43
Germany.....450,000	5,670,000	17,300,000	43
Great Britain 210,000	670,000	19,500,000	93
Italy.....240,000	902,000	10,300,000	38
Russia.....990,000	2,900,000	20,500,000	37

* It is estimated that about 1,000,000 more will be added to the effective strength of the Austrian army by the landsturm law of 1886.

UNITED STATES ARMY.—At the commencement of 1861, the United States army consisted of only about 14,000 regular troops. In various successive levies by the president during the civil war (1861–65), as many as 2,653,062 men had been called out—nearly one-fourth of the entire population of the Northern States. After the war, the standing army was steadily diminished; and by a law passed in June 1874, it is provided that there shall be no more than 25,000 enlisted men at one time. That force is distributed amongst 25 regiments of infantry, 10 of cavalry, 5 of artillery, and 1 battalion of engineers. The actual enlisted strength of the regular army in June 1886 was 24,442, each soldier costing about £278. The country is divided into

three military divisions. Each state is also supposed to have a militia, in which all men from 18 to 45 should be enrolled; but in several states the organisation is imperfect. The organised militia numbers slightly over 91,000 of all ranks; but the number of citizens who in case of war might be enrolled is estimated at over 6,700,000.—See *A Military Dictionary and Gazetteer*, by Captain T. Wilhelm, U.S.A. (Philadelphia, 1881).

ARMY ADMINISTRATION.—The whole of the operations connected with the raising, clothing, paying, maintaining, and controlling of an army are included in the term army administration. The sovereign has the supreme command of the British army, and controls it in every way through the Secretary of State for War, who is responsible to parliament for his own acts and for the advice he gives. The secretary is the head of the War Office (q.v.), and is assisted by two under-secretaries, one permanent, the other parliamentary, but sitting in a different House from his chief. The sovereign's orders affecting organisation, entry into and retirement from the service, promotion, alterations in conditions of service, or, in fine, any fundamental matter of agreement between the sovereign and the soldier, are communicated by 'Royal Warrants' signed by the Permanent Under-secretary for war, and published when necessary. These warrants are also republished in the 'Army Circulars,' a monthly issue of orders (signed by the same functionary) dealing with minute details of allowances, supplies, arms and stores of all kinds, in fact any expenditure of money or material. Army Circulars are supplementary to the 'Revised Army Regulations,' and are incorporated in those books when a new edition is published. Orders connected with the *personnel* of the army, and not involving expenditure, such as training, discipline, medals, rewards, special promotions, &c., are published by the commander-in-chief, acting under authority from the Secretary of State, in monthly pamphlets called 'General Orders,' signed by the adjutant-general of the army. They are supplementary to the 'Queen's Regulations and Orders for the Army,' and are included in the next edition of that volume. By the 'Army Regulations' and the 'Queen's Regulations,' everything connected with army administration is determined—alterations being dealt with by warrants, circulars, and orders, as above described. These latter are also published with the *Army List* for the month following their issue.

In the United States, the supreme command of all military forces is, in terms of the constitution, vested in the president. His representative is the Secretary of War, who is the declared head of the War Department.

ARMY AGENT, a person appointed by government to receive the pay of officers quarterly in advance and act as their banker. The officers draw their pay monthly in arrears from the agent, whose remuneration consists only in the use of the large sums thus always in his hands, and any private banking business that officers may give him. Every regiment has an agent, whose name appears in the *Army List*. Messrs Cox & Co., Craig's Court, London, are agents for nearly all the regiments of the British army. The payment of the soldiers is quite distinct from that of the officers, and is now no part of the agent's duties (see **ARMY PAY DEPARTMENT**).

ARMY CORPS, a miniature army composed of all arms of the service, under the command of a general, and complete with every requisite appliance for war. In the British army, the German model is very closely followed, and an army corps at war strength consists of 36,987 officers and men, 12,846 horses, 90 guns, and 1573 carts and wagons.

The details are given in the following table :

Composition.	Officers and Men.	Horses.	Guns.	Carrriages.
General and Staff	96	80
Three Divisions, complete	30,459	7348	54	960
One Brigade of Cavalry	2320	2177	6	73
CORPS ARTILLERY—				
Staff	21	16
3 Batteries Horse Artillery	543	546	18	30
2 16-pounder Field Batteries	400	316	12	20
Army Corps Ammunition Reserve	513	513	..	99

2d Line, 6 Field Hospitals	318	48	..	74
Postal Department	44	3
Total	36,987	12,846	90	1573

ARMY DISCIPLINE is maintained by the administration of military law as consolidated in the Army Act of 1881, which incorporates the main provisions of the Mutiny Act (q.v.) and the Articles of War (q.v.), and is brought into force, and amended if necessary, each year by the Army Annual Act. This last act also specifies the number of men to be maintained, and the prices to be paid in billets during the ensuing year; it must be passed before the 30th April, on which date the previous act lapses. Military law is regulated by the Rules of Procedure and Queen's Regulations, and by it the soldier is governed in peace and in war, at all times and in all places. It provides for minor breaches of discipline by the power of summary punishment (up to twenty-eight days' imprisonment with hard labour) vested in every commanding officer, and for graver offences by the constitution of courts-martial with powers of sentence varying, according to the rank and number of the officers composing them, from forty-two days' imprisonment to penal servitude and death. At the same time every soldier has a right of appeal from his commanding officer's award to a court-martial, and no sentence of any court-martial can be inflicted without first being confirmed by an officer authorised to do so.

In the United States, army discipline is enforced under the provisions of a code of rules, entitled *Army Regulations and General Orders*, which indicate with great minuteness the duties and privileges of those in the service; giving particularly, under the title *Articles of War*, specific instructions for procedure in cases of infraction of discipline.

ARMY ESTIMATES.—Early each year the War Office sends to the Treasury a series of accounts, setting forth the probable cost of everything required for the period from April 1 to March 31 following. These accounts are called the *army estimates*. In preparing them, the Secretary of State for War applies to the heads of all the departments under him for detailed accounts of their probable requirements (the actual number of men being fixed each year by the *Army Annual Act*—see above); submits them to the Treasury; and, if approved, to the House of Commons. The various items are more or less sifted by the House;

and any one or more of them can be refused altogether, or granted in diminished amount. The amounts under four great headings for 1887–88 are shown above (see *ARMY*, p. 436).

In the United States, annual reports are forwarded by heads of departments to the Secretary of War, and are referred by the president to congress, whose duty it is to examine the details of the estimate, and appropriate from the public funds the sum voted. The average annual cost of the United States army is about \$50,000,000.

ARMY LIST, a list issued monthly by authority of the War Office, of all commissioned and warrant officers of the British army, including the Royal Marines, the Indian army, the Yeomanry, Militia, and Volunteers, whether on full or half pay; together with a list of the headquarters staff at the War Office, and of the staff of each general officer's command at home, in India, and in the colonies, and of the various educational, manufacturing, and other establishments, with other information. A full index, an obituary, a list of the changes gazetted during the past month, and of the last issue of royal warrants, army circulars, and general orders, complete the work. A similar but larger volume is issued quarterly by the War Office, in which, besides the lists of each regiment, the officers of the army are also arranged on a seniority list, with the dates of their commissions and birth.

In the United States, a similar annual publication, the *Official Army Register*, is issued by order of the Secretary of War, and includes a list of the general and regimental officers, and the officers of the various departments, with notices of their services.

ARMY MEDICAL DEPARTMENT, as recently reorganised under the name of the *Medical Staff Corps*, provides one or more medical officers, with several trained men, at every station where troops are quartered in time of peace, forming what are called 'station hospitals.' In large garrisons, the principal medical officer has also under him a quartermaster of the corps for supply duties, and a small number of *nursing sisters*. A surgeon-general represents the department at the War Office. Until 1887, army surgeons ranked as lieutenants on appointment, surgeons-major as majors, deputy surgeons-general as lieutenant-colonels, surgeons-general as brigadiers, and after three years' service as major-generals. All such relative rank was abolished, however, in that year, the change giving rise to great dissatisfaction in the department.

On active service, every battalion, battery, cavalry regiment, or other unit would have a medical officer from the army medical department attached to it, who would be assisted by the 16 battalion stretcher-bearers. Thus 47 medical officers would accompany every army corps, and, in addition, 4 complete Bearer-companies (q.v.), and 25 field hospitals, each for 200 patients; 9 provided with transport, so as to follow the army, and the others stationary at the base and on the lines of communication. Hospital ships would also form part of this department. Each movable field hospital has 7 medical officers, 1 quartermaster, 37 trained orderlies, 10 wagons for stores and equipment, 2 water-carts, 52 horses, and 22 drivers.

The Indian army has a separate medical department of its own, and its field hospitals have a larger establishment of trained orderlies—namely, 122.

ARMY PAY DEPARTMENT.—The financial secretary is the representative of the army pay department at the War Office, and under his supervision the accountant-general prepares the army estimates. The pay of all officers is sent to the army agent of their regiments, but that of

the men to the regimental paymasters, together with the money required to meet other expenses authorised by the finance regulations. There is one paymaster (captain or major) attached to each regiment of cavalry, battalion of infantry, or brigade of artillery; another, of higher rank, to each regimental district; and a 'district paymaster' at the headquarters of each divisional command—the last dealing with the payment of contractors for supplies, engineers' work, &c. The regimental paymaster distributes the money required for the weekly pay of the men to the majors of batteries or captains of companies, by cheque on the local bank, and accounts to the War Office monthly by a pay list containing a muster roll of the regiment, and vouchers for every other expenditure. The *paymaster-sergeant* is clerk to the paymaster.

The daily pay of staff-officers in the British army, in addition to allowances for horses, servants, and lodgings, which are not granted to regimental officers, is, for a lieutenant-general, £5, 10s.; major-general, £3; brigadier-general, £2; deputy-adjutant and quartermaster-general, £2 (assistant do., £1, 6s.); colonel on the staff, £1, 15s.; deputy assistant deputy-adjutant and quartermaster-general, assistant military secretaries, brigade-majors, and aides-de-camp, £1, 1s. The adjutant-general (£2700), quartermaster-general (£2100), military secretary (£2100), and any of the above serving on the headquarters staff in London, receive 'consolidated pay,' instead of daily pay and allowances. The regimental daily pay is as follows: Colonel, £1, 6s. to £1, 10s.; lieutenant-colonel, 18s. to £1, 4s. 9d.; major, 13s. 7d. to 18s. 6d.; captain, 11s. 7d. to 15s.; lieutenant, 5s. 3d. to 7s. 8d.; adjutant, in addition to pay as captain or lieutenant, 2s. 6d. to 3s. 6d.; quartermaster, 9s. to 10s. 6d.; regimental sergeant-major, 5s. to 6s.; master-gunner, 4s. 6d. to 6s.; company sergeant-major, 3s. 9d. to 5s. 4½d.; sergeant, 2s. 4d. to 3s. 4d.; corporal, 1s. 8d. to 2s. 8d.; private, 1s. to 1s. 9d., the higher rates in each case being for the mounted troops. These are the principal ranks and rates of pay; it should be added that an addition is made to the pay of certain officers after 3 and 10 years' service, and that privates receive 1d. a day for every good-conduct badge earned. 'Field-service allowance,' to supply field-kit, &c., according to rank, can be drawn in advance when ordered on active service.

ARMY SCHOOLS comprise only those for the school-tuition of soldiers and their children. Under MILITARY SCHOOLS will be found the Staff College, the School of Military Engineering at Chatham, the School of Musketry at Hythe, Garrison Classes, and the Royal Military College at Sandhurst. Under ARTILLERY, the Royal Military Academy, the Artillery College, and the Department of Artillery Studies, all at Woolwich, with the School of Gunnery at Shoeburyness, are alluded to. Chelsea Hospital is an asylum for veterans, not a school of instruction. The Royal Military Asylum (better known as the Duke of York's School) at Chelsea, and the Royal Hibernian School at Dublin, are orphanages for soldiers' children, not involving a military career for them. Under the supervision of the Director-general of Military Education, army schools are established in every regiment and garrison for soldiers and their children. Every recruit, after having learned his drill, must attend, at least five hours a week, for six months, or until he has obtained a fourth-class certificate for reading, writing from dictation, and sufficient arithmetic to enable him to keep and understand his accounts. Military subjects form no part of this education, except that the dictation generally takes the form of writing orders and

military correspondence. Before being promoted to corporal, a third-class certificate must be gained, and a second-class before promotion to sergeant's rank; while a first-class certificate is required before a soldier can be recommended for a commission. Voluntary attendance is encouraged as much as possible. Soldiers' children, if the parents are married with leave, are required to attend the regimental or garrison school without payment. Should the parents desire it, they may, however, attend any certified denominational school, but must then pay the school fees. An army schoolmaster (see WARRANT OFFICER) has charge of each regimental or garrison school, assisted by well-educated non-commissioned officers or soldiers, and, for the Infant School, by trained army schoolmistresses, with monitresses under them. District inspectors and sub-inspectors, ranking as captains and lieutenants respectively, conduct the examinations for certificates every half-year, and otherwise supervise these schools.

ARMY WORKS CORPS.—This is a collection of skilled artisans and civilian labourers temporarily enrolled for manual labour during military operations, under contract terminating with the exigency of the occasion. During the winter of 1854–55, the British army besieging Sebastopol found it impossible to get heavy guns, shot and shell, provisions, and general stores, up to the front along the only road, 8 miles long and in very bad condition, which connected their camps with Balaklava harbour. Horses and men from the fighting troops could not be spared to assist the transport troops, and therefore an army works corps, 3500 strong, was formed and sent out. The men were strong and efficient railway excavators, miners, and skilled artisans, and were chiefly employed in the construction of a railway from Balaklava to the heights outside Sebastopol. The projected railway from Suakim to Berber was commenced in 1885 by a similar body of men, but they did not bear the name of army works corps, nor have the same organisation.

Amongst the numerous articles on military subjects in this work will be found:

Army-worm, a name sometimes given to the grubs of a small black fly (*Sciara militaris*), very common in some European forests. The name refers to the strange habit of the caterpillars, which collect in large compact armies when about to pass into the pupa stage.

Arnaud, HENRI (1641–1721), pastor and successful military leader of the Waldenses (q.v.), was born at La Tour, in Piedmont, and died among his exiled brethren at Schönberg. In his retirement here he wrote his famous *Histoire de la Glorieuse Rentrée des Vaudois dans leurs Vallées* (1710). It was dedicated to Queen Anne, and has been twice translated into English.

Arnaud, ST. See ST ARNAUD.

Arnauld, ANTOINE, the greatest advocate of his time in France, was born at Paris in 1560.

Descended from an ancient and distinguished family of Auvergne, he strongly supported the claims of Henry IV. to the throne; and became advocate-general and councillor of state. His zealous defence of the university of Paris against the Jesuits in 1594 won for him a wide celebrity. He published a work against the Society of Jesus, and several tracts of a political character. The Jesuits accused him, unjustly, of being a Huguenot. He had twenty-two children, some of whom formed the nucleus of the Jansenists and Port-Royalists. He died 29th December 1619.

Arnauld, ANTOINE, known as 'the great Arnauld,' the twentieth and youngest son of the preceding, was born at Paris, February 6, 1612. Entering the Sorbonne, he was initiated into the scholastic theology, and soon conceived a life-long admiration for St Augustine. In 1641 he attained the dignity of doctor, and was ordained a priest. In 1643 he published a work, *De la Fréquente Communion*, directed against the Jesuit view that the mere reception of the sacrament sufficed, without repentance and preparation, and continued the contest with his *Théologie Morale des Jésuites*.

Arnauld now buried himself in seclusion for twenty-one years, but his pen was almost continuously active. In 1640 had appeared a posthumous work of Jansenius, Bishop of Ypres, entitled *Augustinus*, which laid down with a rigour equal to Calvin's the doctrines of predestination, the corruption of human nature, and the depravity of the will. It was specially addressed against the Jesuits, many of whom entertained Pelagian views of the freedom of the human will. The work was condemned by Pope Urban VIII. in 1641. Arnauld ventured to defend it against the papal bull, publishing a first and second *Apologie de Jansenius*. He also wrote a number of religious works of a non-polemical kind, and became the religious director of the nuns of Port-Royal des Champs, the famous convent of which his sister was abbess. In his retreat he was surrounded by a society of scholarly friends, 'the recluses of Port-Royal,' who lived near the convent—Pascal, Nicole, and others only less distinguished. Here they wrote numerous excellent works—Arnauld and Nicole conjointly the Port-Royal treatises on grammar, geometry, and logic, the last of which, *L'Art de Penser*, became a standard work both in France and elsewhere. In 1650 appeared what he conceived to be his best work, *L'Apologie pour les Saints Pères*. In 1655–56, for prudential reasons, he left his retreat at Port-Royal; about the same time he was expelled from the Sorbonne and the faculty of theology.

In 1656 the war with the Jesuits was renewed by the great Pascal in the *Provincial Letters*—substantially a brilliant defence of Arnauld's position. In 1669 appeared the first volume of Arnauld's *Morale Pratique*, against the moral teaching of the Jesuits. Arnauld, who was a sincere Catholic, defended the doctrine of transubstantiation in his *Grande Perpetuité de la Foi* (1669–74); and he wrote two works to prove that Calvinism subverted morality and the teaching of Christ. After the 'peace of Clement IX.' (1668), Arnauld was presented to the papal nuncio and to the Grand Monarque; but under Jesuit influence, the king issued an order for his arrest. Arnauld hid himself for some time, but finally withdrew into Belgium (1679). Though praised for equanimity and gentleness, he was incessantly engaged in keen controversy, even with his friends; for he wrote not against his enemies only, but against Pascal, Domat, Nicole, his protector Pope Innocent XI., Descartes, and his old friend, Père Malebranche. He died at Brussels, 8th August 1694, and was buried in secret. Arnauld is eminent not merely as a theologian

and thinker, but as a writer of French. His style is clear and pure; and his works are amongst the first in which the scholastic and cumbrous methods of disputation are superseded by modern French precision and force. As a philosopher, he was one of the first to write against the doctrine of perception by ideas representative of the objects, and in some points anticipates Reid and the Scottish school. His indefatigable energy is well illustrated by the famous reply he made to Nicole, who counselled him to take rest: 'Rest!' answered Arnauld, 'shall we not have all eternity to rest in?' His works, in 45 volumes, were published at Paris (1775–83). See PORT-ROYAL DES CHAMPS, PASCAL.

Arnauld, MARIE ANGÉLIQUE, the sister of the great Arnauld, was born in 1591. When little over eleven years of age she was made abbess of Port-Royal. At first careless, she became rigorously severe in the discharge of her duties and the conduct of her life, and by her example and influence speedily brought about a remarkable reformation in the character of the convent. Disapproving of the manner of her own appointment, she resigned her place as abbess, and spent some time in another convent; but in 1636 she returned to Port-Royal, and became prioress under her sister, who was now abbess. She died in 1681, ere the persecutions of Port-Royal (q.v.) began. See Frances Martin's *Angélique Arnauld* (1873).—Her niece, ANGÉLIQUE ARNAULD, was born in 1624. At twenty years of age she became a nun at Port-Royal des Champs. Nine years after, she was made sub-prioress. During the persecution of the Port-Royalists, Angélique Arnauld, by her piety and courage, sustained the spirit of the sisterhood. The whole family, male and female, were determined Jansenists, and none more so than Mother Angélique. In 1678 Angélique was made abbess. She died in 1684, leaving behind her as bright and beautiful a memory as any of her countrywomen. Angélique Arnauld wrote several works, the most valuable of which are the *Mémoires* of her aunt.

Arnauld. ROBERT ARNAULD D'ANDILLY, the eldest son of Antoine Arnauld, the advocate, was born at Paris in 1588. He quitted the bustle of the world for the solitude of Port-Royal des Champs, and made translations in beautiful French from Josephus, St Augustine, St Theresa, and others. He died in 1674.

Arnault, ANTOINE VINCENT, French poet, was born in Paris in 1766, suffered four years' exile as an Imperialist (1815–19), and died, secretary of the Academy, near Havre, 16th September 1834. A rigid classicist, he produced seven dramas—the best *Les Vénitiens* (1799), but all inferior to his *Fables et Poésies* (1812), and *Souvenirs d'un Sezage-naire* (1833).

Arndt, ERNST MORITZ, German poet and patriot, was born in the then Swedish island of Rügen, 26th December 1769. The son of a former serf, he yet received an excellent education at Stralsund, Greifswald, and Jena, with a view to entering the ministry; but in 1805, after travelling over great part of Europe, he became professor of History at Greifswald. His *Geschichte der Leibeigenschaft in Pommern und Rügen* (1803) led to the abolition of serfdom; and in his *Geist der Zeit* (1807) he attacked Napoleon with such boldness, that, after the battle of Jena, he had to take refuge in Stockholm. He was able to resume his functions at Greifswald in 1810; but he resigned the following year, in order to become an active co-operator with the minister, Stein, and other patriots, in stirring up the national feeling of Germany and preparing to throw off the foreign yoke. His songs, poems, and fugitive writings, full of

energy and fire, contributed not a little to rouse and sustain the spirit of Germany before and during the war of liberation. His famous song, *Was ist des Deutschen Vaterland?* and many others, are sung wherever German is spoken. In 1817 he married a sister of Schleiermacher's, and in 1818 became professor of History in the new university of Bonn; but, aiming steadily at constitutional reforms, he was suspended in 1819 for participation in so-called 'demagogic movements,' and was not restored till 1840. He was elected a member of the German national assembly in 1848, but retired from it in 1849. He returned to Bonn, and continued in his fugitive writings to advocate the views of the German national party. Vigorous in mind and body, beloved and revered by the whole German people as 'Father Arndt,' he died at the age of ninety, 29th January 1860. His works comprise an account of the Shetland and Orkney Islands (1826); numerous political addresses to the German nation; some volumes of reminiscences; and his poems (2d ed. 1865). See German lives of him by Langenberg, Baur, and Schenkel, and an English one, with preface by Seeley (1879).

Arndt, JOHANN, a German Lutheran divine, was born at Ballenstedt, Anhalt, in 1555, and died at Celle, Hanover, in 1621. His *Wahres Christenthum* ('True Christianity') was translated into most European languages, and is yet popular in Germany. Its object is edification—the promotion of practical religion; and it is written with great warmth and unction, and in a strain of piety bordering on mysticism. It has been called the Protestant *Imitatio*, and its author the Fénélon of the Protestant Church. There are two English translations—by Boehm (1720) and by Jaques (1815).

Arne, THOMAS AUGUSTINE, Doctor in Music, one of the best and most pleasing of English composers, was born in London, 12th March 1710, and received his early education at Eton. His father, who was an upholsterer, intended to educate him for the bar; but the love of music was too strong to be restrained. Young Arne became skilful as a violin-player, forming his style chiefly on the model of Corelli; and his zeal in the study of music induced his sister (afterwards celebrated as Mrs Cibber) to cultivate her excellent voice. He wrote for her a part in his first opera, *Rosamond*, which was first performed with great success in 1733. Next followed his comic operetta, *Tom Thumb, or the Opera of Operas*; and afterwards his *Comus* (1738), which displayed greater cultivation of style. He married a singer, Cecilia Young (1736); and after a successful visit to Ireland, was engaged as composer to Drury Lane Theatre, and wrote many vocal pieces for the Vauxhall concerts. The national air, *Rule Britannia*, which was originally given in a popular performance, *The Masque of Alfred*, was of his composition, as was also the well-known setting of *Where the Bee Sucks*, written for a performance of the *Tempest*. Besides music for many long-forgotten works, he composed two oratorios, the opera *Eliza*, and another, *Artaxerxes*, in the Italian style; but his genius was better adapted to simple pastoral melody than to great dramatic compositions. In later life he enjoyed considerable reputation as a music teacher, his most distinguished pupil being Miss Brent. He died in London, 5th March 1778.

Arnee is a native name for the wild Buffalo (q.v.) of India.

Arnhem (anc. *Arenacum*; Ger. *Arnheim*), the capital of the Dutch province of Guelderland, on the right bank of the Rhine, 38 miles ESE. of Utrecht by rail. The manufactures include tobacco, woollen and cotton goods, soap, and

paper. The environs are exceedingly picturesque, forming a favourite residence of merchants of the Low Countries. Among its most remarkable buildings are the 'great church,' with interesting monuments, and the town-hall, whose grotesque carvings have gained for it the name of 'Devil's house.' Sir Philip Sidney died in 1586 at Arnhem; in 1813 the town was taken by the Prussians. Pop. (1884) 44,436.

Arnhem Land, a name formerly applied to a region in North Australia, or more properly in the northern territory of South Australia, so called from the ship of the Dutch navigators who discovered it in 1618.

Arnica, a genus of Tubulifloral Composites. The rhizome, leaves, and flowers of the Mountain Arnica (*A. montana*), sometimes called Mountain Tobacco, formerly enjoyed much repute in medicine as a stimulant in paralytic affections, low fevers, &c. The flowers are still employed to yield a tincture which is of service as an external application to wounds and bruises. The plant yields a considerable quantity of tannin, resin, volatile oil, and a peculiar alkaloid (arnicin). The rhizome is perennial and crooked, the stem about two feet high, simple or little branched, with few leaves, bearing on the summit a head of flowers of a dark golden yellow, often two inches in breadth. It flowers from June to August, forms an ornament of mountain meadows in Germany and Switzerland, and is found upon the Continent as far south as Portugal, and as far north as Lapland, but is not a native of Britain. There are a few North American species.

Arnica.

Arnim, HARRY, GRAF VON, born in Pomerania in 1824, from 1864 to 1870 was Prussian ambassador at Rome, where he backed up the anti-infallibilists during the Vatican Council. He was rewarded with the title of Graf, but, as German ambassador to France (1872-74), he fell into Prince Bismarck's disfavour, and, on a charge of purloining state documents, was sentenced to three months', to six months', to five years' imprisonment. He had, however, retired into exile, and died at Nice, 19th May 1881.

Arnim, LUDWIG ACHIM VON, a fantastic but original German writer of romances, was born at Berlin in 1781. After devoting some years to the study of the physical sciences, he began his career as an imaginative author with *Hollins Liebeleben* (1802). He was especially interested in the old popular poetry, and stirred up among his countrymen a warmer sympathy for it by the publication, along with the poet Clemens Brentano, of *Des Knaben Wunderhorn* (3 vols. 1808-19). In 1809 appeared *Der Wintergarten*, a collection of novels; in 1810, a romance, *Die Gräfin Dolores*; in 1811, *Halle und Jerusalem*, a humorous dramatic poem; and in 1817, *Die Kronenwächter*, an historical novel. He died in 1831.—His wife, **BETTINA VON ARNIM**, a sister of Clemens Brentano, was born in 1785 at Frankfort, and married him in 1811. The great event of her early life was her enthusiastic attach-

ment to Goethe, whom she first saw in 1807, he being then nearly sixty. The correspondence, published under the title of *Goethes Briefwechsel mit einem Kind*, in 1835, and translated by Bettina into English, is mainly founded on fancy. Her later works were semi-political in character. She died at Berlin, 20th January 1859. See Löper, *Goethes Briefe an Bettina* (1879).

Arno, next to the Tiber the most considerable river of Central Italy, rises on Mount Falterona, an offset of the Apennines, at an elevation of 4444 feet above sea-level, and 25 miles N. of Arezzo. It flows 140 miles in a generally westward direction, till it falls into the sea, 11 miles below Pisa, where it once had its embouchure. At Florence it is 400 feet wide, but is fordable in summer; and so far, except in the summer, it is navigable for barges. The Italian poets speak of 'the golden Arno'; but, in truth, its waters have mostly the colour of *café-au-lait*. The Arno is noted for the rapid and destructive character of its inundations, the most memorable being those of 1537 and 1740.

Arnobius (1) the Elder, a teacher of rhetoric at Sicca, in Numidia, about 320 A.D. He became a Christian about 300, and died most probably in 327. He wrote, according to Hieronymus, to prove the sincerity of his faith to the bishop who was to baptise him, his seven books, *Adversus gentes*, in which he meets the objections brought against Christianity, but shows that his own theology was not free from Platonic-gnostic conceptions. His work has great value to the student of the religion of Rome from the materials it contains. The standard edition is that by Reifferscheid (1875). An English translation will be found in vol. xix. of the *Ante-Nicene Library*.—(2) **ARNOBIVS** the Younger was a bishop in Gaul in the second half of the 5th century. He wrote a commentary on the Psalms, which is still extant, and which shows traces of semi-Pelagian heresy. It is reprinted in the 53d vol. of Migne's *Patrologia Latina*.

Arnold OF BRESCIA, was a native of that town, and was distinguished by the success with which he contended against the corruptions of the clergy in the early part of the 12th century. He was educated in France under Abelard, and adopted the monastic life. By his preaching, the people of Brescia were exasperated against their bishop, and through him Arnold was cited before the second Lateran Council, and banished from Italy (1139). He retired to France, but experienced the bitter hostility of St Bernard, Abelard's opponent, who denounced him as an enemy of the church. He thereupon took refuge in Zurich, where he remained five years. Meanwhile, an insurrection against the papal government had taken place in Rome, and thither in 1143 Arnold repaired, and endeavoured to lead and direct the movement. He exhorted the people to organise a government similar to the ancient Roman republic, with consuls, tribunes, and equestrian order; but they were disunited and restless, and gave way to the grossest excesses. The city, indeed, continued for ten years in a state of agitation and disorder; but these violent struggles were subdued by Pope Adrian IV. (Nicholas Breakspear), who, feeling the weakness of his temporal authority, turned to the spiritual, and resorted to the extreme measure of laying the city under an interdict, when Arnold, whose party became discouraged and fell to pieces, took refuge with certain influential friends in Campania. On the arrival of the Emperor Frederick Barbarossa for his coronation, in 1155, Arnold was arrested, brought to Rome, and hanged, his body burned, and the ashes thrown into the Tiber. But his influence lived after him, and through his sympathetic insight into his country's needs, his

name is even yet revered and loved in Italy, though he left no record of his doctrines save in the heart of the people. His eloquence and disinterestedness are acknowledged even by his enemies, who are also his biographers, and who have, unintentionally perhaps, placed him in history alongside Savonarola and Rienzi. His life is the subject of tragedies by Bodmer and by Nicolini.

Arnold, BENEDICT, a talented American military officer, whose early brilliant exploits are obscured by his attempt to betray his native country, was born in Norwich, Connecticut, January 14, 1741. By nature reckless and fond of adventure, he ran away from home when fifteen years of age, and joined the provincial troops then engaged in the old French war, but soon deserted. At twenty-one he became a merchant in New Haven. On the breaking out of the Revolutionary war, he joined the colonial forces; accompanied an expedition of 'Green Mountain Boys' (Vermonters), which, under Ethan Allen, captured Fort Ticonderoga; and in 1775, led an isolated detachment of an invading army through the wilds of Maine to Quebec, in the unsuccessful siege of which city he bore an important part. Here he was severely wounded, and for gallant conduct was made a brigadier-general by the colonial congress. Retreating from Canada by way of Lake Champlain, he superintended the construction on its waters of a flotilla, which he handled with much skill at the battle of Valcour Island.

Arnold was of an imperious and violent temper, and was frequently in difficulties with his fellow-officers; and, though greatly admired by General Washington and others high in rank, he appears to have had bitter and influential enemies. In 1777 five of his inferiors in rank were promoted by congress over his head to be major-generals—a circumstance which may be presumed to have sown the seeds of his subsequent disaffection towards the colonial cause. Though greatly chagrined, he was induced by Washington to retain his connection with the army; and, when on leave of absence he heard of the invasion of Connecticut by Governor Tryon, he hastened to join the colonial forces, and was present at the battle of Ridgefield, where his horse was killed under him. For gallantry in this action, he was made a major-general.

In the same year Arnold was sent by Washington to aid in the military operations in eastern New York, and fought with his customary impetuosity in the battles of Saratoga (having his horse killed, and being himself severely wounded), and is credited with having contributed largely by his skill and bravery to the capture of the invading army under General Burgoyne. Disabled temporarily by his wound, he spent much of the winter of 1777-78 in the hospital at Albany, and on the retirement of the royal forces from Philadelphia in the following spring, he was placed in command of that city. Here he met and married the accomplished daughter of Mr Edward Shippen, at whose house the unfortunate Major André (q.v.) had been a welcome guest during Howe's occupation of the city; and through this marriage appears to have begun that fatal acquaintance which resulted in the death of André as a spy, and the disgraceful downfall of Arnold as a traitor.

In 1780 Arnold sought and obtained the command of West Point, on the Hudson River (one of the most important posts in the colonies), which, through a conspiracy with André, he agreed to betray into the hands of the British commander. On the capture of André, and the discovery of the plot, Arnold precipitately fled to the British lines, and was given a command in the royal army. In

1781 he led an expedition against his native state, during which New London was burned, Fort Griswold, on the opposite side of the river, taken, and the garrison massacred. After the close of the war, Arnold resided in London in comparative obscurity, where he died June 14, 1801. See the *Life* by Jared Sparks; and that extenuating his treason, by Isaac N. Arnold (1880).

Arnold, SIR EDWIN, K.C.I.E. (1887), C.S.I. (1888), poet, born 10th June 1832, the son of a Sussex magistrate, and, after an education at Rochester and King's College, London, was elected a scholar of University College, Oxford. He won the Newdigate (1853) with a poem on *Belshazzar's Feast*, for a while was second master at Birmingham, and then became principal of the Government Sanskrit College at Poona. Returning to England in 1861, he joined the editorial staff of the *Daily Telegraph*; and to him was largely due the despatching of Mr George Smith to Assyria, and of Mr Stanley to discover Livingstone. His numerous works include *Poems* (1853); *The Indian Song of Songs* (1875); *The Light of Asia* (1879); *Indian Poetry* (1881); *Pearls of the Faith* (1883); *The Song Celestial* (1885); and *Lotus and Jewel* (1888).

Arnold, MATTHEW, one of the greater modern English poets, and the Sainte-Beuve of English criticism, eldest son of Dr Arnold of Rugby, was born at Laleham, near Staines, 24th December 1822, and educated at Winchester, Rugby, and Balliol College, Oxford. He won the Newdigate with a poem on Cromwell in 1843, and next year graduating with honours, was elected a fellow of Oriel in 1845. After acting for a few years as private secretary to Lord Lansdowne, he was appointed one of the Lay Inspectors of Schools in 1851, an office from which he retired in 1855. In 1857 he was elected professor of Poetry at Oxford. He was more than once sent by government to inquire into the state of education on the Continent, especially in France, Germany, and Holland; and his masterly reports, with their pregnant hints and downright statement of English deficiencies, when published in book form, attracted much attention in England. In 1883 a pension of £250 was conferred on him, and in the same year he lectured in the United States. He held an Italian order, which was conferred on him after he had for two years had charge of the young Duke of Genoa, while under education at Harrow. He died suddenly at Liverpool, 15th April 1888.

Arnold became known as a poet of classical taste and exquisite purity of imagination by the volume published under his name in 1854, consisting of new poems and selections from his two earlier volumes signed 'A.' In 1885 he issued a collected edition of his poems in three volumes. The English-speaking public in both the Old and the New World have long recognised Arnold as standing almost in the front rank of modern poets. Nowhere do we find greater dignity of thought and sentiment, greater distinction in manner and utterance. His verses have the stately calm and purity of marble, but with the faultlessness of an antique statue they have also something of its coldness and severity. His volumes contain nothing unworthy of him—he has always been his own severest critic—no other poet has sustained his flight with so strong and steady a wing. His lines never contain anything but what is essential; the redundant and the merely decorative find no place in poetry where the form is always on the same high level as the thought. Only once has he made an experiment for which his powers were inadequate or unsuited. He lacks the dramatic instinct, and his *Merope*, an imitation of an old Greek play, apart altogether from its being

an essay in a form that has long been dead, was doomed to failure from its lack of dramatic harmony and the sense of reality. As a critic, Arnold is only less eminent than as a poet. His criticisms on poetry contributed to the magazines and reviews did much to raise criticism in England to the level of a serious and almost systematic science, and it was doubly fortunate for English literature that such invaluable criticisms should be embodied in such sweet and lucid prose. Indeed, it would be difficult to overestimate the indirect benefit to our younger writers of having constantly before them such an admirable model and such a high standard for comparison. His literary judgments, pronounced from time to time in magazine articles, in prefaces to selections of poetry, or in occasional lectures or speeches, have long been received by the literary world with a respect much higher than that paid to the utterances of any other writer. His chief prose writings are *Essays in Criticism*, collected in 1865; *Lectures on the Study of Celtic Literature* (1867); *Culture and Anarchy* (1869); *Last Essays on Church and Religion* (1877); *Mixed Essays* (1879); and *Irish Essays* (1882). In his contributions to theology, *St Paul and Protestantism* (1870), and *Literature and Dogma* (1872), the reading public were no less startled by the audacious application of literary criticism to religion, than by the exquisite literary form so novel in works devoted to such questions.

Arnold, SAMUEL, composer, was born in 1740, and died 22d October 1802, having become organist to the Chapels Royal (1783) and to Westminster Abbey (1793). His *Maid of the Mill* (1765), *Prodigal Son* (1773), and other operettas and oratorios, are well-nigh forgotten, compiled as they mostly were from the works of his predecessors; and he is best remembered by his valuable collection of cathedral music (1790).

Arnold, THOMAS, D.D., head-master of Rugby, was born June 13, 1795, at West Cowes, in the Isle of Wight. In 1807 he was sent to Winchester, and remained there till 1811, when he was elected a scholar of Corpus Christi College, Oxford. Having taken a first class in classics (1814), he was next year elected a fellow of Oriel, and he gained the chancellor's prizes for the Latin and English essays in 1815 and 1817. As a boy, we are told, he was shy and retired; as a youth, disputatious, and somewhat bold and unsettled in his opinions; but before he left Oriel, he had won the good opinion of a college which at that time boasted of such names as Copleston, Davison, Whately, Keble, Hawkins, and Hampden. He took deacon's orders in 1818, and the year after settled at Laleham, near Staines, where he occupied himself in preparing pupils for the university. In 1820 he married Mary Penrose, daughter of a Nottinghamshire rector, and sister of one of his earliest friends. Nine years were spent in this quiet life; he was preparing himself for the arduous post he afterwards occupied; he was developing his opinions, and he had also already commenced his great undertaking, the *History of Rome*. It was a period which he himself looked back upon with loving memories. His letters at this epoch reveal to us a fine ambitious spirit bending cheerfully to the task of tuition, more useful than glorious; they also prove to us that those views of a religious and political character which afterwards distinguished him, were maturing in the privacy of Laleham. In one he expresses, in a somewhat sportive and familiar manner, the great principle which he afterwards contended for with so much earnestness, that there should be a Christian laity, a Christian legislature, a Christian government; by which he did not mean a system of laws or government formed in the manner

of the Puritans, out of texts of Scripture rashly applied, but imbued with the *spirit* of the New Testament and of the teaching of Christ. It was at Laleham, too, that Arnold first became acquainted with Niebuhr's *History of Rome*. This was an era in his life. It produced a revolution in his historical views, and his own *History of Rome* was modelled, almost too faithfully, on that of the great German.

From Laleham he was called to undertake the arduous duties of the head-mastership of Rugby. On these he entered in August 1828. Without dwelling on the details of that system of public education which he perhaps carried to its perfection, we may take notice of the high tone, moral and religious, which he infused into the school. He had the tact to make himself both loved and feared. He guided with great dexterity the public opinion of the school. 'In the higher forms,' says his biographer, 'any attempt at further proof of an assertion was immediately checked. "If you say so, that is quite enough; of course I believe your word;" and there grew up in consequence a general feeling that it was a shame to tell Arnold a lie—he always believes one.' On one occasion, when he had been compelled to send away several boys, he said: 'It is not necessary that this should be a school of 300, or 100, or of 50 boys, but it is necessary that it should be a school of Christian gentlemen.'

But the school was far from occupying Arnold's whole energies. The *History of Rome* went on; he took part in all the great questions of the day, political and theological. In politics he was a Whig, without being fettered by the ties of party. In the theological discussions of the time, he was chiefly distinguished by the broad views he had adopted of the nature of a Christian church. As already intimated, it was his leading idea that a *Christian people* and a *Christian church* ought to be synonymous expressions. He would never tolerate that use of the word church which limited it to the clergy, or which implied in the clergy any peculiar sacredness, or any trace of mediatorial function. The *priest* was unknown to him in the Christian community; this placed him at once in antagonism to the High Church party; and even Low Churchmen complained that he did not set sufficient value on their sacred order. But all, of whatever party, admitted and admired the zeal with which he taught that the full spirit of Christianity should permeate the whole of our civil or political life. If he seemed to lower the altitude of the clergy, it was only because he would raise the general level of the laity. He was convinced that 'the founders of our present constitution in church and state did truly consider them to be identical, the Christian nation of England to be the church of England; the head of that nation to be, for that very reason, the head of the church.'

In domestic life Dr Arnold was most happy; here he was distinguished by unflinching cheerfulness and spirit. In 1832 he purchased Fox How, a small estate between Rydal and Ambleside; and in this charming retreat he enjoyed in the vacations, amongst the family circle, his own uninterrupted studies. In 1841 he received from Lord Melbourne the Regius Professorship of Modern History at Oxford—an appointment accepted with great delight. He delivered some introductory lectures, which were heard with enthusiastic interest; and it was his intention, on his retirement from Rugby, to enter with zeal upon the duties of his professorship. But this and all other literary enterprises were cut short by a sudden and most painful death. The journey to Fox How was to be taken in a few days, when he was seized with a fatal attack of *angina pectoris*. Few biographies end more abruptly or more mourn-

fully; but he met his death with perfect fortitude and Christian hope, on 12th June 1842. He is buried in Rugby Chapel. His principal works are six volumes of *Sermons* (best ed. 1848); an edition of *Thucydides* (3 vols. 1830-35); the *History of Rome* (3 vols. 1838-43), broken off by his death at the end of the second Punic war; and his Oxford historical Lecture (1842). 'These,' in the words of an *Edinburgh* reviewer, 'are all proofs of his ability and goodness. Yet the story of his life is worth them all.' And that story has been admirably told by Dean Stanley in his *Life and Correspondence of Arnold* (1845, 12th ed. with additions, 1881).

Arnold, THOMAS KERCHEVER, a writer of educational works, was born at Stamford in 1800, and was educated at Trinity College, Cambridge, where he graduated in 1821. In 1830 he became rector of the small parish of Lyndon, in Rutland-shire, and there he died on the 9th March 1853. In 1838 he published his *Practical Introduction to Greek Prose Composition*, of which, in 1849, when it reached a seventh edition, more than 20,000 copies had been sold. Next year appeared his *Latin Prose Composition*. These works are still largely used, and new editions of both appeared in 1881. He also published, with the Rev. J. E. Riddle, an *English-Latin Lexicon* (1847); edited twenty-five volumes of classics; and produced English, French, Italian, German, and Hebrew grammars. All these works show his obligation to continental, especially German, scholars. As a theologian, he published several volumes of sermons, and some controversial treatises.

Arnot, WILLIAM, a popular Scottish preacher and author, was born at Scone in 1806, studied at Glasgow, and became minister of a parish there in 1839. He left the Established Church at the Disruption in 1843, becoming a minister of a Free Church in Glasgow; in 1863 he went to Edinburgh, and there he died in 1875. He published *Laws from Heaven for Life on Earth*, *Illustrations of the Book of Proverbs*, *The Parables of our Lord*, and *The Church in the House*. His *Autobiography and Memoir*, edited by his daughter, appeared in 1877.

Arnott, NEIL, was born at Arbroath in 1788, the son of a Catholic farmer. From Aberdeen Grammar-school he proceeded to Marischal College; and after going through the medical course, came up to London in 1806, and studied seven months at St George's Hospital. He made two voyages to China as surgeon in the service of the East India Company, then from 1811 till 1855 carried on a large practice in London. He was physician to the French and Spanish embassies, an original member of the senate of the London University (1836), a fellow of the Royal and Geological Societies, and Physician Extraordinary to the Queen (1837). He died in London, 22d March 1874. A course of lectures (1823-24) on natural philosophy in its applications to medicine formed the basis of his *Elements of Physics; or Natural Philosophy, General and Medical* (1827, 7th ed. 1876). In 1832 he invented the Water-bed (q.v.); and his treatise on *Warming and Ventilating* (1834) describes the 'Arnott Stove' and 'Arnott Ventilator' (see WARMING AND VENTILATION). His *Survey of Human Progress* (1861) is full of enlightened views on improvement generally. He was a munificent benefactor to the higher education, he and his widow giving no less than £12,000 to the London University, the four Scottish universities, and two ladies' colleges in London.

Arnotto. See ANNATTO.

Arnsberg, a town of Westphalia, on the Ruhr, 36 miles E. of Hagen by rail. In the orchard below its ruined castle is still pointed out the spot where

the famous Vehmgerichte (q.v.) was held. Pop. (1885) 6131.

Arnstadt, the chief town in the principality of Schwarzburg-Sondershausen, picturesquely situated on the Gera, 10 miles S. of Erfurt. It is one of the oldest Thuringian cities, its existence being traceable as far back as 704 A.D. Formerly it was the chief emporium for trade between the fertile lowlands and the Thuringian forest region, but is now a manufacturing town, engaged in weaving, glove-making, brewing, &c. Pop. (1885) 11,537.

Arnsvalde, a Prussian town, 41 miles SE. of Stettin, between three lakes. Pop. (1885) 7378, largely iron-workers.

Arokszállás, a town of Hungary, 44 miles NE. of Pesth. Pop. (1880) 12,794.

Arolsen, the capital of the principality of Waldeck, on the Aar, 14 miles SSW. of Warburg. Its castle (1720) contains a library with valuable MSS., Pompeian antiquities, and West's 'Death of Wolfe.' The sculptor Rauch and the painter Kaulbach were natives. Pop. (1885) 2442.

Aromatics constitute a class of medicines which owe their properties to the essential oils, to benzoic and cinnamic acids, to volatile products of distillation, or to odorous glandular secretions. The plants that contribute to this class of medicines are those which yield essences, camphor, or odorous resins, and amongst the families which yield the most important aromatics are the Labiatae, Umbelliferae, Lauraceae, Myrtaceae, Aurantiaceae, Coniferae, Scitamineae, Orchideae, &c. In some cases, the aromatic matter is diffused throughout all parts of the plant, but it is usually condensed in particular organs, such as the root, in the case of ginger and galanga; or the bark, in the case of cinnamon, canella, and cascarilla; or the flowers, as in the case of cloves; or the fruit, as in the case of anise and vanilla; or the wood, as in the case of sandal-wood and aloes-wood; or the leaves, as in the case of most of the Labiatae, Umbelliferae, &c.

Aromatics may be arranged in the following subclasses: (1) Those in which the active principle is an essential oil, as the oil of thyme, lavender, cajuput, neroli, fennel, &c. (2) Those containing camphor, or an allied body, such as artificial camphor obtained from turpentine. (3) Bitter aromatics, in which there is a mixture of a bitter principle and an essential oil, as chamomile, tansy, wormwood, &c. These are tonics and vermifuges. (4) Those of which musk is the type, such as civet and ambergris; and certain plants with a musk-like odour, such as *Malva moscata*, *Mimulus moschatus*, and *Hibiscus abelmoschus*. (5) Those containing a fragrant resin, as benzoin, myrrh, olibanum, storax, and the balsams of Peru and Tolu, which possess stimulant properties. (6) Lastly, those which are artificially produced by destructive distillation, as tar, creosote, benzol, or the various empyreumatic oils.

As a general rule, these substances act as diffusible stimulants of more or less power, and as antispasmodics, while those in which a bitter principle is present act as vermifuges and tonics. The whole class were formerly regarded as possessing disinfectant and antiseptic properties, and there is no doubt that some, as coal-tar, creosote, &c. strongly possess this property. In this country we usually associate aromatics with other medicines; but in France aromatic infusion, lotions, baths, &c. are prescribed. The composition of aromatic infusion may be given as an illustration: Take equal parts of the leaves of sage, ordinary and lemon thyme, hyssop, origanum, wormwood, and mint; and infuse 50 parts of these leaves in 100 parts of boiling water.

Aromatic Series. This term is applied to a large group of organic chemical compounds, many of which occur in balsams, essential oils, and other substances having an aromatic odour. It was originally limited to the compounds of the benzoic group, but it has now been extended so as to include other series homologous with them, and ranging round the group of hydrocarbons, C_nH_{2n-6} . The simplest of these hydrocarbons is Benzene (q.v.), in which there are six atoms of carbon, the formula being C_6H_6 . Now, such a body is an unsaturated one (see ATOMIC THEORY), and is capable of uniting with monatomic elements such as chlorine to form chlorides, containing from one to six atoms of chlorine. To account for this, Kekulé has devised a structural formula for benzene, which assists one in understanding the complex relations of the aromatic series; but it must be borne in mind that such formulæ do not profess to represent the actual positions of the atoms in the compound, but are only used as convenient stand-points from which to regard them. In Kekulé's formula, the double lines, uniting the atoms of carbon, indicate that each of these atoms can still unite with an atom of hydrogen. From this peculiar construction, it is evident that the compounds of the aromatic series must have distinctive properties, and the number of these compounds be very large.

Thus, referring to chlorine, we see that we may either *replace hydrogen by chlorine*, or add chlorine to benzene, the resulting bodies having the composition C_6Cl_6 and C_6H_5Cl , when the full amount of chlorine has been taken up. So also oxygen may enter into the compound, giving us a series of bodies called *phenols*, which are monatomic, diatomic, or tetratomic, according to the number of atoms introduced. The phenols correspond to the alcohols of the fatty series (see ALCOHOLS), ordinary phenol having the formula C_6H_5OH , that of common alcohol being C_2H_5OH . Hydrogen may also be replaced by amidogen, NH_2 , giving rise to *Amines* (see ALKALOIDS), the best known of which is Phenylamine, or Aniline (q.v.), $C_6H_5NH_2$. The *nitro compounds*, in which hydrogen is replaced by the group NO_2 , include nitrobenzene, or artificial oil of bitter almonds (not to be confounded with the true Oil, q.v.), the formula of which is $C_6H_5NO_2$.

When carbon enters the benzene group, C_6H_6 , it forms many new compounds. Thus hydrogen may be replaced by radicals such as methyl and ethyl, CH_3 and C_2H_5 , giving rise to such compounds as

Methyl benzene..... $C_6H_5CH_3$;
Ethyl benzene..... $C_6H_5C_2H_5$;

or, again, more than one molecule of these radicals may be introduced, as in

Dimethyl benzene..... $C_6H_4(CH_3)_2$;
Methyl-ethyl benzene..... $C_6H_4CH_3C_2H_5$.

From these again are derived aldehydes, alcohols, and acids, of which we can only give a single example:

Methyl benzene, or toluene..... $C_6H_5CH_3$;
Benzyl alcohol..... $C_6H_5CH_2OH$;
Benzyl aldehyde..... C_6H_5COH ;
Benzoic acid..... C_6H_5COOH .

All of which, in their composition and properties, show close analogies to the corresponding fatty compounds. An account of the aromatic series would be incomplete without reference to the *isomerism* which exists among its members. A reference to the formula for benzene will show that when only one atom of chlorine has been

introduced into the molecule, there can only be one monochlor benzene. When two, however, are present, or when one atom of chlorine and one of bromine have replaced hydrogen, as in chlorobromo benzene, the case is different:

Here we see that the atoms of hydrogen replaced may be either contiguous (1'2), separated by one group of CH (1'3), or by two groups (1'4); and that this is not a mere distinction on paper is borne out by experiment, which has succeeded in producing three chlorobromo benzenes, differing in properties, but identical in percentage composition. There are many other isomeric bodies known, but for further information the reader must refer to the article on ISOMERISM, or to a practical treatise on the subject.

Aromatic Vinegar differs from ordinary vinegar (which is acetic acid diluted with water) in containing certain essential oils which impart an agreeable fragrance. It is generally prepared by adding the oils of cloves, lavender, rosemary, bergamot, neroli, and cinnamon to the strongest acetic acid. Aromatic vinegar is a very pleasant and powerful perfume; it is very volatile, and when snuffed up by the nostrils, is a powerful excitant, and hence is serviceable in fainting, languor, headache, and nervous debility. Aromatic vinegar is generally placed on a sponge in a smelling-bottle or in a *vinaigrette*; it can also be purchased as a liquid in phials; and a drop or two allowed to evaporate into a sick-room, overpowers, but does not destroy any unpleasant odour. The liquid must, however, be cautiously dealt with, as it is very corrosive.

Aronia. See CRATÆGUS.

Aroo'stook, a river which, rising in the north of Maine, falls into the St John in New Brunswick, after a course of about 120 miles. It possesses an historical interest from its connection with the long-agitated question of the north-east boundary between British America and the United States.

Arouet, the family name of Voltaire (q.v.).

Arpad, the national hero of Hungary, under whom the Magyars first gained a footing in that country, about 884. Chosen duke on his father's death, he extended his conquests by incessant and mostly successful warfare with the Bulgarians, Wallachians, and Moravians, and made more than one successful incursion into Italy. He died in 907, leaving his power to his son. The Arpad dynasty ruled Hungary as dukes from 889 to 1000, and as kings from that year until it became extinct in the male line with Andreas III. in 1301. Arpad yet lives in the popular songs of the country, and not a little legend has gathered round his name.

Arpeggio, in Music, a chord of which the notes are given, not simultaneously, but in succession. From any one chord, several forms of arpeggio may be produced. In modern music the arpeggio is usually indicated by a perpendicular waved line prefixed to the chord.

Arpent, an old French land-measure, corresponding to the English acre. It contained a hundred square perches, and varied with the varying value of the perch from about an acre and a quarter to about five-sixths of an acre; or, in modern French measure, from one-third to one-half of a hectare.

Arpi'no (anc. *Arpinum*), the birthplace of Cicero and Marius, stands perched on an eminence, midway between Rome and Naples, about 65 miles from each. Pop. (1881) 5145.

Ar'quà, an Italian village with about 1000 inhabitants, 12 miles SW. of Padua, in the heart of the Euganean Hills. Here Petrarch died July 18, 1374; his house may still be seen, and his monument of red marble in the churchyard.

Ar'quebus, or **HARQUEBUS** (from Dutch *haakbus*, lit. 'a gun with a hook'), was the first form of hand-gun which could fairly be compared with the modern musket. Those of earlier date were fired by applying a match by hand to the touch-hole; but about the time of the battle of Morat, in 1476, guns were used having a contrivance suggested by the trigger of the arbalest or cross-bow, by which the burning match could be applied with more quickness and certainty. Such a gun was the arquebus. The arquebus being fired from the chest, with the butt in a right line with the barrel, it was difficult to bring the eye down low enough to take good aim; but the Germans soon introduced an improvement by giving a hooked form to the butt, which elevated the barrel; and the arquebus then obtained the name of the *haquebut*. Soldiers armed with these two kinds of weapon were designated *arquebusiers* and *haquebutters*—the former were common in the English army in the time of Richard III., the latter in that of Henry VIII.

Arquebusier.

Arraca'cha (*Arracacha esculenta*), a plant of the natural order Umbelliferae, a native of the elevated tablelands in the northern parts of South America. It is much cultivated in its native country for its roots, which are used as an esculent. When boiled, they are firm and tender, with a flavour not so strong as that of a parsnip. The plant is very like hemlock, to which genus Humboldt indeed referred it, and has a similar heavy smell. The flowers are in compound umbels, and are of a dull purple colour. The arracacha was at one time very strongly recommended as a substitute for potatoes; it was introduced into Britain through the exertions of the Horticultural Society, and its cultivation perseveringly attempted; but it has been found unsuitable to the climate of Britain, and of other parts of Europe where it has been tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavourable to it. The climate of the south of Ireland resembles that of its native regions more than any other in the British Islands. It seems to require a very regular temperature and constant moisture. There are probably some parts of the British colonies in which the arracacha would be found a very valuable plant. In deep loose soils

Arracacha.

it yields a great produce. It is generally propagated, like skirret, by offshoots from the crown of the root. By rasping the root and washing, a starch, similar to arrowroot, is obtained.—There is another species of the same genus, *A. moschata*, a native of the same regions, the root of which is uneatable.

Arrack, or **RACK**, is an East Indian name (derived from the Arabic) for all sorts of distilled spirituous liquors, but chiefly to that procured from *toddy* or the fermented juice of the cocoa and other palms, as well as from rice and the kind of brown sugar called *jaggery*. The palms in other tropical countries furnish a fermented beverage similar to the toddy of India, and in a few instances also it is distilled, but arrack essentially belongs to India and the adjacent countries. The cocoa-nut palm (*Cocos nucifera*) is a chief source of toddy or palm-wine, which is obtained from trees ranging from twelve to sixteen years old, or in fact at the period when they begin to show the first indication of flowering. After the flowering shoot or spadix enveloped in its spathe is pretty well advanced, and the latter is about to open, the toddy-man climbs the tree and cuts off the tip of the flower-shoot; he next ties a ligature round the stalk at the base of the spadix, and with a small cudgel he beats the flower-shoot and bruises it. This he does daily for a fortnight, and if the tree is in good condition, a considerable quantity of a saccharine juice flows from the cut apex of the flower-shoot, and is caught in a pot fixed conveniently for the purpose, and emptied every day. It flows freely for fifteen or sixteen days, and less freely day by day for another month or more; a slice has to be removed from the top of the shoot very frequently. The juice rapidly ferments, and in four days is usually sour: previous to that it is a favourite drink known in some parts of India as *callu*, and to the Europeans as *toddy*. When turning sour, it is distilled and converted into arrack. It is largely manufactured in Goa, Batavia, Ceylon, and Siam. A similar spirit is made pretty largely from the magnificent fan-leaved palm, *Borassus flabelliformis*, and also from the so-called date-sugar palm, *Arenga saccharifera*. The name is also given to a spirit obtained from rice and sugar fermented with cocoa-nut sap. An imitation arrack may be prepared by dissolving 10 grains of benzoic acid in a pint of rum.

Arrah, a town of Bengal, 320 miles NW. of Calcutta by rail. Here in 1857 a dozen Englishmen, with 50 Sikhs, held out for eight days against 3000 sepoys. A force despatched to their aid fell into an ambuscade, and lost 290 out of 415 men; but finally they were relieved by Major Eyre. Pop. (1881) 42,998.

Arraignment, in the practice of the criminal law in England, means calling a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. His innocence being presumed, it is the law, and is so laid down in the most ancient books, that, though charged upon an indictment of the gravest nature, he is entitled to stand at the bar in the form and in the garb of a free man, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands. When arraigned on the charge of treason or felony, the prisoner may be called upon by name to hold up his hand, by which he is held to confess his identity with the person charged. This form, however, is not an essential part of the proceedings at the trial, and it is sufficient for the prisoner, when arraigned, to confess his identity by verbal admission or otherwise. When thus

duly arraigned, the indictment is distinctly read over to the accused in the English tongue, and he then either confesses the fact—that is, admits his guilt—or he puts himself upon his trial by a plea of 'Not guilty.' Formerly, an incident of the arraignment sometimes was the prisoner's *standing mute*, as it was called—that is, refraining from, or refusing, a direct answer to the indictment; in which case the court proceeded to inquire whether the silence was of malice on the part of the prisoner, or was produced by the visitation of God, and to deal with him accordingly (see *PEINE FORTE ET DURE*). But by the 7 and 8 Geo. IV. chap. 28, sect. 2, it is enacted that where a prisoner shall stand mute of malice, it shall be lawful for the court to order the proper officers to enter a plea of 'Not guilty,' on which the trial shall proceed, as if the plea had been actually pleaded by the prisoner himself. Where, however, there is room for doubt as to the sanity of the prisoner standing mute, a jury consisting of any twelve persons who may happen to be present is forthwith charged to inquire whether he has intellect enough to plead and to understand the course of the proceedings. If they find the affirmative, the plea of 'Not guilty' is entered, and the trial goes on; but if the negative, the insane person is ordered by the court to be kept in strict custody during Her Majesty's pleasure, according to the 39 and 40 Geo. III. chap. 94, sect. 2.

In the Scotch criminal law, the expression *Calling the Diet* corresponds to arraignment. The prisoner is called upon by name by the presiding judge to attend to the indictment against him, which is read aloud by the clerk, and the prisoner is then required to plead, as in England, either 'Guilty' or 'Not guilty.' If 'Not guilty,' the trial proceeds—the prisoner, either by himself or his counsel, having always the last word.

The term arraignment is derived from the French *arraisonner*, the ancient form of which, according to Littré, is *araisnier*. See TRIAL, INDICTMENT, INFORMATION, PROSECUTION, PLEA, VERDICT, NOT PROVEN.

Arran, an island of Buteshire, in the mouth of the Firth of Clyde, 5½ miles SW. of Bute, 10 W. of Ayrshire, and 3 E. of Kintyre, from which it is separated by Kilbrannan Sound. It is of an oval form, 19 miles long and 10½ broad, with an area of 168 sq. m., about a seventh part being cultivated. Pop. (1821) 6541; (1881) 4730. The general aspect of Arran is mountainous and heathy, and in the north the jagged peaks are singularly grand. All around the coast is the low platform of an ancient sea-margin, with lofty cliffs on the S. and SW., from which the country rises abruptly. The highest point is Goatfell (a corruption of the Gaelic *Gaoth Bheinn*, 'wind mountain'), which, rising to a height of 2866 feet, forms a prominent feature of the island. From its sides slope the romantic glens of Rosie and Sannox, and at its base to the SE. opens Brodick Bay, at the head of which lay, until lately, Brodick village. The houses which composed it have now been removed, and a new village has sprung up on the opposite side of the bay, called Invercloy, where there is a spacious hotel. To the south of this, round a bluff headland, is Lamlash Bay, the chief harbour of Arran, and the best on the Firth of Clyde, sheltered by Holy Island, once the seat of a monastery. A picturesque mass of columnar basalt, 1030 feet high, succeeds. Farther south lies Whiting Bay, near which are two cascades 100 and 50 feet high respectively. At the SE. point of Arran is Kildonan Castle, opposite which is the small isle of Pladda, crowned by a lighthouse. Large caverns occur in the cliffs of the S. and SW. coast. In one of these, the 'King's Cave,' in the basaltic promontory of

Drumadoun, Robert the Bruce hid himself for some time. Shiskan Vale, opening into Drumadoun Bay, is the most fertile part of Arran. Loch Ranza, a bay in the north end of Arran, runs a mile inland, and is a herring-fishing rendezvous. Arran is a favourite resort for summer quarters; there is daily communication with it by means of steamboats from Ardrossan and the Clyde, the ports touched at being Brodick, Lamlash, and Corrie. The geology of Arran is almost unique, and displays a greater succession of strata than any other part of the British Isles of equal extent. The SE. half consists of Devonian sandstone, extending from the east coast 4 or 5 miles inland, and running SW. from Brodick beyond the centre of the island; and of trap rocks and carboniferous strata, which occupy the middle and western portions. The NW. half consists of a central granite nucleus, including Goatfell, bordered on the west by a tract of mica-slate, and on the north, east, and south by Lower Silurian rocks, which, again, have a run of Devonian sandstone on the east and south. Lias and oolite lie on the mica-slate. There are only rivulets in Arran; one of them tumbles over a precipice 300 feet high. Some level parts in the south half of Arran are fertile. The chief crops are oats and potatoes. Cattle, sheep, fish, and oats are exported. With the exception of the Kirk-michael estate of 3632 acres, the whole island belongs to the Duke of Hamilton, whose seat is Brodick Castle. Many antiquities occur, such as cairns, standing stones, and stone circles. Several stone coffins were found in a cairn 200 feet in circumference. Loch Ranza Castle, now in ruins, was once a residence of the Scots kings. From Brodick Bay, Bruce sailed to Carrick on his expedition for the recovery of the crown. See D. Landsborough's *Arran* (2d ed. 1875), and J. Bryce's *Geology of Arran* (4th ed. 1875).

Arranging, a term in Music which means the adapting of a piece of music so as to be performed on an instrument or instruments different from those for which it was originally composed, as when orchestral or vocal compositions are set for the pianoforte, or the reverse. It corresponds with the work of translation in literature, and requires similar gifts. The pianoforte arrangements of Franz Liszt have excelled all others, although in some cases he may have overstepped the boundary of propriety. Many of the classical masters, especially Bach, Beethoven, and Mendelssohn, have themselves performed the task of arranging their own music. See ACCOMPANIMENT, PORTOURRI, and FANTASIA.

Arras, the capital of the French department of Pas-de-Calais, on the navigable Scarpe, 120 miles N. of Paris. A fortress of the first rank, it consists of an old town on an eminence, and a new town in the plain. Among the principal edifices are the cathedral (1755-1833) and the beautiful Gothic hôtel-de-ville (1510), whose belfry, 246 feet high, was rebuilt in 1835. There are manufactures of lace, hosiery, beet-sugar, and agricultural implements, and a brisk trade in corn and oil. It was long so famous for its tapestry that in England the name *arras* was given to tapestry hangings. Arras was the capital of the Celtic Atrebatas (whence the name), and subsequently of the province of Artois. As such it was long a part of Burgundy. It was ceded to France in 1482, but came to Austria in 1493; nor did it finally become French till 1640, when Louis XIII. took it after a long siege. Robespierre was a native. Pop. (1872) 21,447; (1881) 27,041.

Arrest. To arrest an offender or a debtor is to seize his person, in order that he may be brought to trial, or compelled to obey the law. In English

criminal practice, arrest may take place in two ways: (1) *Without Warrant*.—According to Mr Justice Stephen, any person may arrest any one who commits a felony or gives a dangerous wound in his presence, any one whom he reasonably suspects of felony (if a felony has in fact been committed), or any one whom he finds committing certain offences specially provided for by statute. A peace-officer may also arrest any one who commits a breach of the peace in his presence, or any one whom he reasonably suspects of felony (whether a felony has been committed or not). His statutory powers of arrest are also wider than those of private persons; he may, for example, arrest any person whom he finds loitering at night, whom he has reason to suspect of having committed or being about to commit a crime; and (in the Metropolitan district) any person loitering at night who cannot give a satisfactory account of himself. (2) *With Warrant*.—A warrant is an order addressed by a judge or magistrate to a peace-officer, or to the officers within a certain district. If the person against whom it is issued is not within the jurisdiction of the authority issuing it, the warrant must be 'backed' by a magistrate of the place where such person is, or is supposed to be. Warrants issued in one part of the United Kingdom may be backed by a magistrate in another part. By an act of 1881, provision has been made for backing warrants throughout Her Majesty's dominions. The act applies to treason, piracy, and every offence which, by the law of that part of the empire where it was committed, is punishable by twelve months' imprisonment with hard labour. For the arrest of offenders against foreign law, or of offenders against British law taking refuge in a foreign country, see EXTRADITION.

In executing a warrant, or in making a lawful arrest, an officer, or even a private person, may break open doors in pursuit of the person whom he is authorised to take. Obstruction of an officer making an arrest has always been treated as a serious offence; it seems that a person may still be charged with treason if he rescues a prisoner charged with treason. Modern legislation treats this offence as a misdemeanour, for which imprisonment with hard labour is the appropriate punishment. But to rescue a murderer or a prisoner is punishable by penal servitude. The same subject is treated in Scotch law under the head *Deference*, which Sir Archibald Alison, in his work on the Criminal Law of Scotland (vol. i. p. 491), says, 'consists in the resistance to the officers of justice in the execution of their duty.' It is essential to such deference that it should be such as to defeat the warrant or other process which authorises the arrest. Mere unsuccessful attempts with this view are charged under the name of 'resisting and obstructing the officers of the law in the execution of their duty.'

On the other hand, persons who are active in assisting the officers of the law may be compensated for their expense and trouble, as provided by an act of 1851, which amends and extends the provision contained in an act of 1827. A special allowance may be made to any person who has shown extraordinary courage, diligence, or exertion.

In English civil procedure, arrest takes place only in exceptional cases. All the superior courts have power to arrest or attach persons for contempt. By an order of the court or a judge (which is not made without notice to the party), a writ may be issued to the sheriff, commanding him to arrest a certain person, and have him before the court to answer his contempt. Defendants on civil process were formerly arrested by means of the writ of *ca sa* or *capias ad satisfaciendum*. But this writ is now rarely issued, unless in the cases expressly

excepted out of the Debtors Act, 1869. That act put an end to imprisonment for debt, except where non-payment of money due involved contempt of or disobedience to the order of a competent court, as, for example, where a trustee refuses to comply with the order of a court of equity. Orders of committal are now made for the most part by judges of county-courts, to compel payment of a debt by instalments, where the debtor is drawing weekly wages, or has other means of paying the instalments, but has no furniture or other goods on which execution can be levied.

Arrest may also be made to prevent a debtor from absconding, or from removing his property out of the jurisdiction. Ancient writs available for this purpose were those of *capias ad respondendum* and *ne exeat regno*; the modern practice is regulated by the Debtors Act, 1869, and the Bankruptcy Act, 1883, sect. 25. Arrest on mesne process (i.e. during the progress of a suit, and before judgment given) is now abolished, except as above explained.

The following are privileged from arrest on civil process: Ambassadors and diplomatic representatives of foreign courts; peers of the United Kingdom; Scotch and Irish peers; members of parliament; clergymen during divine service, or going to or returning from service; and all persons attending any court of justice, as parties, witnesses, solicitors, or counsel. Barristers are probably entitled to their privilege only when attending the superior courts; Archbold, in his *Practice of the Common Law*, refers to a case where a barrister was discharged who was arrested on circuit. Persons in attendance on the sovereign are privileged; writs of protection were formerly issued to persons in the royal service, but this prerogative is now seldom or never exercised. In regard to privilege of parliament, it may be observed that though members of both Houses are free from arrest on civil process, actions may be brought against them; and the 10 Geo. III. chap. 50 provides that such actions are not to be delayed on pretence of privilege. It is also provided by the Bankruptcy Act, 1883, that if a person having privilege of parliament becomes bankrupt, he may be dealt with as if he had no privilege. No person who is a bankrupt may sit in either House; and if a member of the House of Commons fails to satisfy his creditors within a year after he is adjudicated a bankrupt, his seat becomes vacant. Privilege does not exempt any person from arrest for contempt of court.

In the Scots law, the word arrest is not a technical term for process against the person. But see ARRESTMENT and ARRESTMENT FOR FOUNDING JURISDICTION; also ATTACHMENT.

Arrestment, in the Scots law, is the legal process or diligence, as it is called, by means of which a debtor is prohibited from making payment or delivery to his creditor until another debt or claim due to the person making use of the arrestment by such creditor is secured or paid. Thus, if A owes £100 to B, but B, again, is indebted to C, arrestment may be used by C in the hands of A; the effect of which is to prevent A paying to B until C's claim has been satisfied. A, the party in whose hands the arrestment is laid, is called the arrestee; C, the user of the arrestment, is called the arrester; and B, the arrester's debtor, is called the common debtor. The arrestment, however, has not the effect of transferring the debt or subject arrested. For that purpose, a particular form of action, called an *action of furthcoming*, is necessary, decree in which operates as a complete transfer to the arrester. Arrestment in security is also used on the dependence of an action, so as to secure the debt which the pursuer expects to establish by decree. Arrestments are frequently recalled by

the court as oppressive, especially where a limited security is given. Arrestment in the hands of a man's banker is practically tying up his means. The corresponding diligence against land is called Adjudication for Debt, or, if in security, Inhibition.

The corresponding English term is Attachment of Debts (q.v.).

ARRESTMENT FOR FOUNDING JURISDICTION is a procedure in Scots law, by which a foreigner, or other debtor abroad, who is not subject to the jurisdiction of the Scottish courts, but who has movable property in Scotland, may be made subject to the jurisdiction of the Court of Session. By the Sheriff Courts Act, 1877, foreigners may be sued in the sheriff courts also, if a ship, in which the foreigner is interested, has been arrested within the sheriffdom. In the ordinary case, what is attached is money due to the foreigner, and any sum, however small, and any movable, if of appreciable value, is sufficient. The procedure is therefore one liable to great abuse; it should not be extended beyond the convenience of trade, on which the custom was originally based in the Netherlands. In practice it has been extended to all claims of a pecuniary nature, but not to actions relative to *status*. The practice must be treated as an exception to the general rule that a pursuer should go to the court of his debtor's residence. The only equivalent in England is the custom of foreign attachment in the city of London. Heritable property in Scotland is a distinct ground of jurisdiction against foreigners without special procedure.

ARRESTMENT OF WAGES, so far as required for the aliment of the artisan or servant, has always been prohibited by the common law of Scotland. Such arrestment is considered to be injurious to the working-classes, because it encourages transactions upon credit. This idea was supported by the result of a government inquiry, originating in Glasgow in 1853. By statute in 1845, such arrestments were prohibited absolutely in small-debt actions. The limit of what is required for aliment in the case of artisans and farm-servants and labourers, was fixed by statute in 1870 at 20s. per week, the excess being arrestable. This rule, however, does not apply to claims for rates and taxes, or for the support of a child.

ARREST OF JUDGMENT is the name of a motion made after verdict in the criminal courts of England, for acquittal on the ground that there is a blunder in the indictment. There was formerly a similar application in the common law courts, but this is now by appeal from the order of the judge to enter the verdict. See JUDGMENT.

Arrhena'therum, a genus of grasses. See GRASSES.

Arrian, FLAVIUS, a native of Nicomedia, in Bithynia, born about 100 A.D. A disciple and friend of Epictetus, the Stoic philosopher, he was admitted to the citizenship in Athens, and in 124 A.D. to that of Rome at the hands of the Emperor Hadrian. He was appointed prefect of Cappadocia in the year 136, and under Antoninus Pius, the successor of Hadrian, he was promoted to the consulship. But some four years afterwards, he appears to have retired from public life, and devoted himself to literature in his native place, where he died at an advanced age in the reign of Aurelius. As the pupil and friend of Epictetus, he edited the *Manual of Ethics (Enchiridion)* left by his master, and wrote the lectures of Epictetus (*Diatribæ*) in eight books, of which only four have been preserved. The most important work by Arrian is the *Anabasis Alexandrou*, or history of the campaigns of Alexander the Great, which has come down to us almost entire. This book is our chief authority on the

subject of which it treats; and is a work of great value. Arrian had chosen Xenophon as his model of composition, and hence the Athenians called him the young Xenophon. In close connection with his former history, Arrian wrote his Indian History, giving an account of the people of India. Other writings by Arrian, his letter to Hadrian on a voyage round the coasts of the Euxine Sea, and another, a voyage round the coasts of the Red Sea, are valuable with regard to ancient geography. The best edition of Arrian's *Anabasis* is that by Krüger (1848); Eng. trans. by Chinnock (1884).

Arrondissement (Fr. from *arrondir*, 'to make round'), an administrative district forming a subdivision of a French Department (q.v.).

Arrow. See ARCHERY.

Arrow-grass. The popular name of *Tirglochin*, a genus of Alismaceæ, of which two species occur in Britain.

Arrowhead (*Sagittaria*), a genus of petaloid monocotyledons of the order Alismaceæ, distinguished by unisexual flowers, having three herbaceous sepals and three coloured petals, with numerous stamens and carpels, the latter separate. They are aquatic plants, natives of very different climates, from the tropics to the cold regions of the world.—The Common Arrowhead (*S. sagittifolia*) is a beautiful aquatic, a native of England, with arrow-shaped leaves which rise above the surface of the

Arrowhead (*Sagittaria sagittifolia*).

water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The starchy corms have sometimes been used for food, but have an acrid unpleasant taste. *S. sinensis* has long been cultivated in China and Japan; and *S. obtusifolia* (N. America) is also used as food. Several species and many varieties of this genus are found in North American waters.

Arrow-headed Characters. See CUNEIFORM.

Arrow-heads. See ELF-BOLTS and FLINT IMPLEMENTS.

Arrowroot is a variety of starch extracted from the roots of certain plants growing in tropical countries. It is a fine starchy farina, much valued as a delicacy, and as an easily digestible food for children and invalids. It is obtained from the root-stocks (*rhizomes*) of different species of *Maranta*, belonging to the natural order of Scitamineæ. The species chiefly yielding it is *M. arundinacea*, a native of tropical America, cultivated in the West India Islands, and growing about 2 feet high, with ovate-lanceolate somewhat hairy leaves, clusters of small flowers on two-flowered stalks, and globular fruit about the size of currants. The rhizomes are often more than a foot long, of

the thickness of a finger, jointed, and almost white, covered with large papery scales. They are dug up when a year old, washed, carefully peeled, and reduced to a milky pulp. In Jamaica the roots are reduced by beating in deep wooden mortars; in Bermuda, by means of a wheel-rasp; but modern machinery has now been introduced. The pulp is

Arrowroot (*Maranta arundinacea*):

A, flowering branch; B, base of flower stem; C, branch of the rhizome. (From Bentley and Trimen's *Medicinal Plants*.)

then mixed with much water, cleared of fibres by means of a sieve of coarse cloth or hair, and the starch is allowed to settle to the bottom. The water dissolves, and so removes the greater part of the albumen and salts, the starch quickly settling down as an insoluble powder, which is then purified by successive washings. The arrowroot is finally dried in the sun or in drying-houses, from which dust and insects are excluded by means of gauze. The careful peeling of the roots is of great importance, as the skin contains a resinous matter which would impart a disagreeable flavour. Great precautions are taken against impurities; and the knives used in peeling the roots, and the shovels used in lifting the arrowroot, are made of German silver. The West India arrowroot most esteemed in the market is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East India arrowroot is not in general so highly valued, perhaps because substitutes for the genuine arrowroot more frequently receive that name. The *Maranta arundinacea* is now, however, cultivated to some extent both in the East Indies and in Africa. *M. indica* is to be regarded as a more variety, with perfectly smooth leaves. It is cultivated both in the East Indies and in Jamaica, and other species and varieties are sometimes cultivated. What is called Florida arrowroot is in part prepared from *Zamia integrifolia*; but the genuine *Maranta* arrowroot is also produced in Florida.

The amount of starch present in the rhizomes varies, according to age, from 8 to 26 per cent.

Arrowroot is exported in tin cases, barrels, or boxes, carefully closed up. It is a light, opaque, white powder, which, when rubbed between the fingers, produces a slight crackling noise, like that heard when newly fallen snow is being made into a snowball. Through the microscope the particles are seen to be convex, more or less elliptical, sometimes obscurely triangular, and not very different in size. The dry starch is quite inodorous, but when dissolved in boiling water, it has a slight peculiar smell, and swells up into a very perfect

jelly. Potato-starch, with which it is often adulterated, may be distinguished by the greater size of its particles, their coarser and more distinct rings, and their more glistening appearance. Refined sago-flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculated. Arrowroot is also sometimes adulterated with rice-starch, and with the common starch of wheat-flour.

Tapioca (see MANIOC) was formerly sometimes called Brazilian arrowroot; and the starch prepared from many other plants has often also usurped the name. Thus 'Chinese arrowroot' is said to be from the tubers of *Nelumbium speciosum*. East Indian arrowroot is often prepared from different species of *Curcuma* (see TURMERIC), while *Dion edule*, *Zamia*, and other cycads are used in Mexico, *Tucca oceanica* in the Sandwich Islands, and so on; even the starch of maize sometimes appearing as Oswego arrowroot, that of Arum as Portland arrowroot, and that of potato as 'English arrowroot!' Although materially differing in rate of digestibility, arrowroot proper having in this respect the advantage, all these varieties of starchy food have much the same nutritive value, and all alike require the addition of milk to form an adequate food. It should further be borne in mind that all starches alike are indigestible to infants, whose salivary ferment is undeveloped.

The name arrowroot had its origin from the use of the fresh roots as an application to wounds to counteract the effects of poisoned arrows; and the expressed juice has been accordingly recommended as an antidote to poisons, and a cure for the stings and bites of venomous insects and reptiles.

Arrowsmith, AARON, born at Winston, Durham, in 1750, at the age of twenty came up to London, and by 1790 had established a great map-making business, his chief productions being maps of the World, North America, Scotland, and Southern India. He died 23d April 1823.—His nephew, JOHN (1790–1873), was also an eminent cartographer.

Arroyo Molinos, a village in Estremadura, Spain, noted as the scene of the complete discomfiture of the French forces under General Girard by Lord Hill on the 28th October 1811, who took 1500 prisoners, the whole artillery, colours, baggage, &c., with a trifling loss to himself. French historians (Thiers and others) maintain that the battle was 'undecided.'

Arru Islands, a group of over eighty islands in the Dutch East Indies, lying west of New Guinea, with a united area of about 2650 sq. m., and a population of some 15,000. The largest island is Tanna-Besar (77 miles long by 50 broad). The surface is low, and the coasts are steep and inaccessible, on the east side fringed with coral reefs. The soil is covered with the most luxuriant vegetation. The islands are remarkably rich in animal life, especially birds, mostly related to those of New Guinea. The inhabitants resemble the Melanesians of New Guinea more than the natives of the Moluccas. On the ground of this inclination to the Papuan type, in connection with the peculiar formation of the Archipelago, Wallace has advanced the supposition that the Arru Islands formed originally a part of New Guinea. There is an active trade, but not in native hands. Cotton and woollen goods, iron and copper wares, Chinese pottery, knives, rum, rice, opium, and arrack are imported, and bartered for mother-of-pearl, trepang, edible nests, pearls, tortoise-shell, and the skins of birds of paradise.

Arsacidae, a dynasty of Parthian kings, so called from the name of its founder, Arsaces, who wrested a kingdom for himself from the feeble

grasp of the Seleucid Antiochus II. about 250 B.C. Its greatest kings were Mithridates, Phraates, Mithridates 'the great,' Volagases I., and Artabanus, who lost his crown and his life at Hormizdján, in 227 A.D., in his attempt to stem the conquering career of Ardashir, founder of the Sassanian dynasty. See ARMENIA, and PARTHIA.

Arsamas, a Russian town, 60 miles S. of Nijni-Novgorod. It has thirty-four churches, three monasteries, important leather manufactures, and considerable trade in sail-cloth and sheep-skins. Pop. (1881) 11,497.

Arsenal (through Ital. and Span. forms from Arab. *dār aṣṣinā'ah*, 'workshop,' made up of *dār*, 'house,' *al*, 'the,' *cinā'ah*, 'art.' The Span. *atarazana* best preserves the wider sense of the Arabic original; the other languages have narrowed its meaning to 'dock' or 'armoury'), a term formerly applied merely to a repository of naval stores and ordnance, but now extended to the foundries and factories of warlike stores, for both army and navy, as well as to the depôts where they are stored. The principal arsenals of Great Britain, in their true sense as naval stores and dockyards, are at Deptford, Chatham, Pembroke, Sheerness, Portsmouth, and Plymouth. The only government foundry for shell and heavy guns in Great Britain is at Woolwich (q.v.). There is a manufactory of small-arms at Enfield, and abroad, arsenals at Gibraltar, Malta, and Calcutta, with a gun-factory at Cossipore.

In France, the principal naval arsenals are at Cherbourg, Brest, Toulon, L'Orient, Rochefort, Dunkirk, Havre, St Servan, Nantes, Bordeaux, and Bayonne, with military arsenals at Paris; in Russia, at St Petersburg, Cronstadt, and Sebastopol; in Prussia, at Danzig; in Denmark, at Copenhagen; in Turkey, at Constantinople; in Italy, at Genoa, Livorno, Spezia, Civita Vecchia, Naples, Ancona, and Venice; in Austria, at Trieste; in Spain, at Cadiz, Carthagena, and Barcelona; in Portugal, at Lisbon. The principal armouries of the United States are at Springfield, Massachusetts, where small-arms are manufactured, and at Watertown, in the same state, where heavy guns are cast; besides which there are numerous other arsenals and depôts of supply in various states and territories. There are naval arsenals at New York, Boston, Baltimore, and other points on the coast.

Arsenic and its Compounds. Arsenic (through Lat. from Gr. *arsenikon*, 'arsenic,' a word meaning literally 'male,' *arsēn*, from the notion of the old alchemists that metals were of different sexes) is the name applied in popular language to a well-known poisonous substance, arsenious acid, but, strictly speaking, the term is restricted to the metal, of which the symbol is As, and the atomic weight 75. The metal arsenic is rarely found free in nature, but in a state of combination it occurs largely. The most important of all arsenical minerals, because of their use as ores of arsenic, for the preparation of white arsenic, or arsenious acid, are those in which arsenic is combined with nickel and cobalt. The chief of these are arsenical pyrites, or leucopyrite, nickeline, cobaltine, and smaltine, which are found in Cornwall and the continent of Europe, as well as in other parts of the world. The last-named two are used for the preparation of blue colours for porcelain or stoneware. The presence of arsenic in a mineral may commonly be detected by the alliaceous odour which it emits before the blowpipe.

The metal is generally prepared from arsenious acid, As_2O_3 , by mixing it with its own weight of charcoal, placing the mixture in a well-covered crucible, and subjecting the whole to heat, when

the metal set free by the charcoal rises, and condenses in the upper part or cover of the crucible. Metallic arsenic is very brittle, can easily be reduced to powder by hammering, or even pounding in a mortar; and when a freshly cut surface is examined, it presents a brilliant dark steel-gray lustre, which, however, readily tarnishes on exposure to the air. The metal, as such, is not considered poisonous, but when introduced into the animal system, it is there faintly acted upon by the juices, and in part dissolved, at the same time, exhibiting poisonous properties. When heated in the open air, it burns with a peculiar bluish flame, and emits a characteristic alliaceous odour. The only use to which the metal arsenic is applied in the arts is in the manufacture of leaden shot of the various sizes, when its presence in small quantity in the lead renders the latter much more brittle than it ordinarily is. Of all the compounds of arsenic the most important is the one already alluded to—namely, arsenious acid, which is an oxide of arsenic. With sulphur, arsenic forms two important compounds: *Realgar*, As_2S_3 , a red, transparent, and brittle substance, which is employed in the manufacture of the signal-light called *White Indian Fire*; and *Orpiment*, As_2S_3 , or *King's Yellow*, a cheap pigment of a yellow colour. With hydrogen, arsenic forms arseniuretted hydrogen, AsH_3 , a very poisonous gas, and one which has been fatal to several chemists.

ARSENIOUS ACID is the arsenical compound most familiarly known. It is obtained principally during the roasting of the arsenical nickel ores in Germany in furnaces communicating with flues. When the arsenic of the ore burns, it passes into the condition of arsenious acid, As_2O_3 , and rising as vapour into the somewhat cool flue, is there deposited as a grayish powder, known by the names of *Smelting-house Smoke*, *Flowers of Arsenic*, *Poison-flour*, or *Rough Arsenious Acid*. In this condition, the arsenious acid is contaminated with some impurities, from which it may be separated by introducing the gray powder into an egg-shaped vessel, and applying heat at the lower end, when the arsenious acid rises in vapour, and condenses in the cool end as a transparent glassy or vitreous substance. Ordinary arsenious acid of the shops (which is what is popularly known as *arsenic*) is a white crystalline powder, which feels decidedly gritty, like fine sand, when placed between the teeth, and has no well-marked taste. It is very heavy, so much so as at once to be noticeable when a paper or bottle containing it is lifted by the hand. It is soluble in about 10 parts of boiling water, or 100 parts of cold water. As ordinarily sold in quantities under 10 lb. in weight, the arsenious acid is required by law to be coloured with $\frac{1}{4}$ of its weight of indigo, or $\frac{1}{8}$ of its weight of soot; the object of the admixture being to render any liquid to which the arsenious acid might be added, with a murderous intent, of a black or bluish-black hue, and thus indicate the presence of something unusual. In packages of 10 lb. and upwards, arsenious acid is allowed to be sold in the pure white crystalline form without coloration. When placed in a spoon, or other vessel, and heated, the arsenious acid volatilises, and condenses in crystals on any cool vessel held above. Again, when arsenious acid is placed on a red-hot cinder, the strong alliaceous odour characteristic of arsenic is given off. When thrown upon water, instead of at once descending through the water like sand, arsenious acid, notwithstanding its great density (specific gravity 3.70), partially floats on the surface, as wheat-flour does; and that portion which sinks in the water rolls itself into little round pellets, which are wetted only on the outside, and contain much dry arsenious acid

within. The solution of arsenious acid in water is recognised by three tests:

(1) Hydrosulphuric acid and hydrochloric acid produce a *yellow precipitate* of sulphide of arsenic, As_2S_3 , soluble in ammonia.

(2) Ammonio-sulphate of copper, an *apple-green precipitate* of arsenite of copper, CuHAsO_3 .

(3) Ammonio-nitrate of silver, a *yellow precipitate* of arsenite of silver, As_3AsO_3 .

In many cases, arsenious acid is used as a means of destroying animal life, but, happily, the processes for the detection of the poison in organic mixtures and in the animal tissues are unerring and trustworthy.

For the isolation and recognition of arsenious acid in organic mixtures, such as the contents of a stomach, the method generally pursued is called Reinsch's process, from the name of its discoverer. The manner of its application is to treat the organic mixture with water sufficient to render it thin, then add hydrochloric acid to the extent of one-eighth of the volume of the liquid; apply heat, and when the whole has been raised to near the boiling-point, introduce clean, newly burnished pieces of copper in the form of wire, gauze, or foil. If arsenious acid be present in the mixture, a steel-gray coating of metallic arsenic will form on the surface of the copper. This apparent tarnishing of the copper may take place when no arsenious acid is in the mixture, and may be produced by salts of mercury, antimony, &c., as well as by sulphur compounds, and even occasionally by fatty matters. To distinguish between the coating formed by arsenious acid and that produced by other substances, the copper is taken out of the mixture, washed with water, to remove acid; immersed in ether, to dissolve off any adherent fatty matter; dried between folds of blotting-paper; introduced into the lower end of a dry glass test-tube, and there cautiously heated. The metallic arsenic, As , is driven off by the heat from the surface of the copper, rises in vapour into the upper portions of the test-tube; there meets the oxygen of the air, with which it combines, forming arsenious acid, As_2O_3 , and thereafter deposits itself on the inner surface of the cool part of the tube in little glistening crystals. On allowing the tube to cool, adding water thereto, and applying heat, the water dissolves the crystals of arsenious acid, yielding a solution, to separate portions of which the liquid tests mentioned above may be successfully applied.

Arsenious acid forms compounds (salts) with alkalis and other bases, which are called arsenites. Some of these are employed in commerce and medicine. Arsenious acid, boiled with a solution of potash, or carbonate of potash, forms an arsenite of potash, used in medicine, and known as *Fowler's Solution* or *liquor arsenicalis*. Many sheep-dipping mixtures are composed of arsenious acid, soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. A compound of arsenious acid and the oxide of copper, called the arsenite of copper, or *Scheele's Green*, is a pigment largely used by painters as a pretty and cheap green paint. The same substance is, or was formerly, extensively employed in the manufacture of common green paper-hangings for the walls of rooms; and it seems certain that rooms covered with paper coated with this green arsenite of copper are detrimental to the health of human beings residing therein, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. Another green pigment is named *Schweinfurth Green*, and contains arsenious acid, oxide of copper,

and acetic acid, and is a double arsenite and acetate of copper.

Arsenic has long been used as a medicine. When taken into the stomach, it is soon absorbed into the blood, acting powerfully in such skin diseases as Psoriasis, Lepra, Eczema (q.v.), &c. As a tonic alterative it holds a high place, and it is much used in ague, remittent fever, and St Vitus's dance. The usual method of administering arsenic is in small doses (from three to five drops) of the liquor arsenicalis, largely diluted with water, twice or thrice in the day.

When given in the doses above mentioned, for eight or ten days, symptoms of poisoning begin to appear, the skin becoming hot, the pulse quick, the eyelids hot and itchy; the tongue has a silvery appearance; the throat is dry and sore, the gums swollen and tender; and if the treatment is persisted in, salivation ensues, and then come nausea, vomiting, diarrhoea, nervous depression, and faintness. The quantity necessary to destroy life, of course, varies, but under circumstances favourable for its operation the fatal dose for an adult is from *two to three grains*. Death from a poisonous dose of arsenic may occur in a few hours, or after the lapse of days. Arsenic has been used frequently as a slow poison, the symptoms being attributed to inflammation of the bowels from natural causes. Fortunately, in most cases its detection is easy.

In some countries, especially in Austria (though the practice is not unknown in England), arsenic is given to cattle and horses to render the skin bright and glossy. In Styria, arsenic is taken by the peasant girls to increase their personal attractions; and it has been definitely ascertained that over a considerable area in the south-west of Austria, including Styria, Carinthia, Salzburg, Tyrol, Lower Austria, and the Erzgebirge, arsenic eating is largely practised by men, who nevertheless attain a healthy old age. Arsenic eaters, who generally begin the use of the drug secretly, say that it improves the complexion, increases the digestive powers, and so strengthens the respiratory organs as to enable the bearers of heavy burdens to climb mountains with ease. At first a dose may be taken once a week, afterwards daily; and there are authenticated cases of men who consume six grains—enough to poison three men—at one dose without inconvenience. Once the habit is established, it is impossible to give up arsenic eating. Terrible heart-gnawings following any attempt gradually to stop the practice; and sudden cessation causes death. That arsenic can be taken habitually for any length of time with impunity was formerly regarded as a physiological impossibility; and yet the fact is established on unquestionable evidence.

No effective chemical *antidote* for arsenic has yet been discovered. In case of an overdose, or of intentional poisoning, the following treatment is recommended: Evacuate the stomach by the stomach-pump, using lime-water; administer large draughts of tepid sugar and water, chalk and water, or lime-water; avoid the use of alkalies, but administer charcoal and hydrated sesquioxide of iron; bleed freely; take a tepid bath, and use narcotics. If the fatal symptoms be averted, let the patient for a long time subsist wholly on farinaceous food, milk, and demulcents.

Arsin'oe, daughter of Ptolemy I., king of Egypt, born 316 B.C., married at sixteen the aged Lysimachus, king of Thrace, whose eldest son, Agathocles, had already wedded Lysandra, her half-sister. Desirous of securing the throne for her own children, Arsinoë prevailed on her husband to put Agathocles to death; whereupon Lysandra fled with her children to Seleucus in Asia, and induced

him to declare war against her unnatural father-in-law. Lysimachus was slain, and Seleucus seized the kingdom. Arsinoë now sought refuge in Macedonia, which, however, was also taken possession of by Seleucus; but on his assassination, a few months later, by Ptolemy Ceraunus, her half-brother, she received a hypocritical offer of marriage from the usurper, who wanted to destroy her two sons lest they should prove formidable rivals to his ambition. She consented to the union, and opened the gates of the town in which she had taken refuge, but her children were butchered before her eyes. She then fled to Egypt, where, in 279, she married her own brother, Ptolemy II. Philadelphus.—There was a city of Arsinoë in Middle Egypt, formerly called Crocodilopolis; another near the head of what is now the Gulf of Suez; and three of the same name in Cyprus.

Arsis and Thesis (Gr., 'raising up,' and 'laying down'), grammatical terms applied to the elevation and depression of the voice in speaking. In music, they signify the strong position and the weak in a bar, and are indicated by the down-beat and up-beat of the hand.

Arson (Old Fr. from Lat. *ardere*, 'to burn'), in the criminal law of England, is a felony, described as the malicious and wilful burning of the house or building of another man. It is essential to the offence that the house or building burned should be that of *another*; to destroy one's own house by fire, especially in a town, or where other buildings are contiguous, which are thereby put in danger, is only a misdemeanour. Mere negligence will not support a charge of arson—there must be criminal intention. The matter is dealt with by the Criminal Law Consolidation Act of 1861, and various penalties of penal servitude and imprisonment are imposed. The statutory offence includes the setting fire to a house in the possession of the offender, if it be done with intent to defraud, and also the setting fire to growing woods and farm produce (the most frequent form of this offence), and to any goods in a house which it would be a felony to set fire to. The statute also includes the case of using explosives against a house, and renders all attempts at arson offences punishable by penal servitude or imprisonment. By special statutes for the protection of the public service, setting fire to ships of war, arsenals, government stores, &c., or the attempt to do so, is punishable by death.

In Scotland, the technical term is *wilful fire-raising*. This is properly confined to setting fire to buildings, growing or stored corn, growing wood, or coal-heughs; but the common law extends to many minor offences, such as burning sheds, haystacks, and furniture. A man is of course entitled to burn his own property; but one of the most common offences is burning property with intent to defraud insurers. The tendency of the Scots law is to exact a wider criminal responsibility than in England for negligence in fire-raising, and for the indirect results of the offender's act. The statutory punishment of wilful fire-raising in Scotland is still death, but penal servitude is the punishment actually inflicted.

Ars-sur-Moselle, a town of Alsace-Lorraine, on the river Moselle, 6 miles SW. of Metz by rail. Pop. (1885) 4620, largely iron-workers.

Art. A man in the savage state is one whose whole time is of necessity occupied in getting and retaining the things barely needed to keep him alive. When a society is able to supply its needs without using up, to that end, all the time of all its members, leisure arises, and some or all of them are enabled to devote part or even the whole of their time to occupations other than the support

and protection of life. All such occupations have pleasure for their aim, and are included in the domain of art in its widest sense. The earliest forms of art were naturally methods of decoration applied to objects of daily use. Prehistoric man is known to have developed several kinds of decoration. Innumerable decorated objects of every kind have been dug up, the like of which are often actually found in use among little developed races in our own day. Every work of art, says Mr Ruskin, 'either states a true thing, or adorns a serviceable one.' The earliest existing 'statement of truth' in the form of art is probably to be found amongst the engraved bones which the cave-dwellers have left behind them. Some of these bones have first been formed into convenient shape for handles and the like, and afterwards roughly sculptured into the likeness of an animal's head. Others have been used as so much paper to draw upon, without any visible intention of applying them afterwards to purposes of utility. Beasts of the chase formed the subjects which these prehistoric artists scratched with the point of a flint upon the bones. One engraved outline of a mammoth has been found, and many of stags knee-deep in the long grass. Not impossibly this early study of animal life was connected with those rudimentary beliefs which, in the form of fetishism, seem to have been universal in all the least-developed peoples. Animal life, again, is the subject of the best work of Egyptian and Chaldean artists.

In ordinary speech the intonation of the voice already provides the materials for song. Passionate speech approximates to song still more closely. Musical notes can be gained from shaped pieces of wood, stone, and other simple contrivances. Thus rude forms of music could and doubtless did arise very early, generally in connection with the dance or with some kind of mimetic performance out of which the drama was in time destined to arise.

Civilisation seems to have first arisen in three great river-basins—those of the Nile, the Tigris and Euphrates, and the Yang-tse-kiang. About early Chinese art we as yet know next to nothing. Chaldaea does not come within the range of history till very much later than Egypt; nevertheless, the civilisations of the two countries probably arose independently, and at about the same time. In Egypt, animal-worship always retained its hold upon the people down to the latest times, but it was coupled with ancestor-worship. The art of Egypt arose chiefly out of the latter part of the religion. The preservation of the body or the likeness of the dead was essential in the estimation of every Egyptian. Hence arose mummification; hence also portrait sculpture for burial, and monumental sculpture for display. It was likewise essential to preserve the aspect of the ordinary occupations of life, because, by the intervention of Osiris, such representations were believed to be made real for the souls of the dead. Hence the number of incidents of everyday life depicted on the walls of Egyptian tombs, often with great skill, especially in the rendering of animal forms, the traditions of the treatment of which may have descended from a remote antiquity. The monumental architecture of Egypt was likewise encouraged by the same desire for permanence. In its earliest known forms (the pyramids, mastabas, &c.), it was essentially an architecture of the tomb. The quantity of the harder rocks readily available, helped to determine the nature of Egyptian art. Chaldaea is a stoneless country. Its arts chiefly depended upon the nature of clay for their forms. The Chaldeans (proto-Babylonians) wrote upon clay tablets, which were afterwards baked. They built with bricks, chiefly sun-dried. They invented the potter's wheel at an early date, and

they found out how to enamel. Their chief buildings were covered with enamelled bricks. They imported stone, which they sculptured well (the statues from Tello in the Louvre), treating it as a precious thing. They were great magicians, believers in the power of many spirits capable of being represented by natural objects—a belief at first not far removed from fetishism. They therefore studied the motions of the heavenly bodies; and their temples were solid staged towers of sun-dried brick, raised above the mists of the plains. They invented the forms of winged men and animals to represent certain demons and spirits; the figures of angels also come to us from Chaldaea. The dome and the proto-Ionic capital were Chaldean inventions. The Assyrians borrowed their arts and sciences from the Chaldeans, but they infused their own fierce spirit into the more subtle ideals of their neighbours. The Hittites, whose empire in Asia Minor and Syria was probably contemporary with the rise of Assyrian power, would owe their culture to Assyria. The Phoenicians, whose power in the Levant culminated later, borrowed their arts partly from Egypt, partly from Assyria. Their trading ships traversed all parts of the Mediterranean. An inartistic people themselves, they yet produced a most important effect in the development of art, for it was by their commerce that the artistic and other products of different countries were exchanged. The Greeks were thus brought in contact with works of art made by the Egyptians and the peoples of the East. Assyrian traditions likewise reached them overland through Asia Minor. The influences of Egypt and Assyria are clearly perceptible in early Greek works and legends. Greek art developed very slowly at first. It was only under the influence of the passionate struggle of Greece against the Persian hosts, that the Hellenic ideal took perfect form. It may be called an Ideal of Reserve. In architecture and sculpture alike this ideal reigns, culminating in the age of Pericles. Gods are represented in perfect human shape, without exaggeration of form or posture, and with little expression beyond an aspect of benevolent calm and satisfaction. After the Peloponnesian war, the purity of this ideal passed away. Sculpture tended to become theatrical or portrait-like, and portraiture became the leading art. In Italy there was little native art, except that which the Etruscans cultivated, and of which they seem to have derived the origins from the Phoenicians. The only known remnants of it are objects found in tombs. The Greek influence was next powerfully felt, especially in those parts which were colonised by Greek settlements. After the conquest of Greece by Rome, the Hellenic influence in art became supreme. Roman artists, in the time of the empire, developed in architecture a style founded upon that of the Greeks, with certain oriental elements added. The dome and the semi-dome were very much employed by Roman architects. Fresco and mosaic were likewise much used. Portrait sculpture flourished. When the capital of the empire was removed to Byzantium, oriental influences became stronger, and Greek traditions gradually lost predominance. The ancient traditions still lingered on in Italy, but new influences from Byzantium changed the ideals there also.

The adoption of Christianity had not at first much effect upon the style of art. Roman influences had for a long time pervaded all Western Europe. When the barbarian invasions commenced, and the western empire fell, art was for a time completely paralysed. Ireland alone was practically untouched. Celtic art seems to have been a local product, influenced at some early date by Byzantine-Greek traditions brought over

perhaps by early missionaries. As order slowly emerged out of the chaos that followed the fall of the Roman empire, local styles of art began to arise here and there. In these, Roman and barbarian traditions were mingled. Irish missionaries laid the foundation of Anglo-Saxon art, and carried the Celtic style to various parts of Europe. The influences of Byzantium and of the old traditions still lingering in parts of Italy, were likewise felt from time to time. Under the Merovingian kings, local revivals of art were effected. Charles the Great made the first really successful attempt at an organised revival, in which he was assisted by workmen trained at Byzantium. A promising revival likewise took place in Italy under the Lombards. Every revival in the north of Europe was, however, nipped by a return of warfare and disorder.

It was not till after the year 1000 A.D. that the tendencies towards a permanent revival became fixed. Then arose in North Germany and along the Rhine the Romanesque style. Many fine churches built in this style in the 11th and 12th centuries are still in existence. Under the direction of Bishop Bernward, the school of Hildesheim reached great excellence. Fine churches were built, excellent metal-work done, manuscripts beautifully illuminated, and wall-paintings executed in a very noble style. The Romanesque style owed little to Byzantium, but much to Italy. The crusades, by bringing East and West in contact, helped to quicken the new life. The ancient art of Chaldæa, handed over to the Persians, modified by Egyptian and Greek influences, altered in its ideals by the rise of Mohammedanism, had waxed in power, and become in the hands of the Saracens thoroughly different in style and aims from the arts of Europe. Its chief centres were Bagdad, Cairo, and Spain. Sicily very early experienced the influence of this school. Its decorative principles spreading throughout Western Europe in conjunction with Byzantine influences, created the great style of Gothic art (which had nothing to do with the Goths). Gothic art was especially cultivated in the feudal countries. It was different in France from what it was in England, but in both countries it reached its perfection in the first half of the 13th century, and then gradually declined. When Gothic art was culminating in the north of Europe, Italy was in a backward condition. Some fine buildings were raised, but the amount of artistic production was small.

The religious revival brought about by Francis of Assisi in the 13th century rapidly changed this state of things, and an intellectual revival followed. Fresco-painting improved under the hands of Cimabue, Giotto, and their followers at the end of the 13th and the beginning of the 14th centuries, who worked chiefly for Franciscan patrons. The Dominican revival soon succeeded, and then, in the 15th century, fine schools of art of all kinds flourished in various parts of Italy. The revival of classical study gave a new impetus to art. Ancient sculptures and buildings were studied and imitated, and about the commencement of the 16th century the culmination of this epoch of art was reached. Meantime, in the north of Europe, in the 15th century, painting had been cultivated with great success, whilst Gothic traditions were everywhere losing power. Under the influence of the mystic preachers, a beautiful school of painting arose in the Rhine Valley in the 14th century, Meister Wilhelm and Meister Stephan of Cologne being its leading artists. At the beginning of the 15th century, the centre of art-life in the North shifted to the Low Countries. There the Van Eycks made technical improvements in the method of painting, besides introducing the study of nature as

the chief aim of their art. The Flemish school influenced all Germany, and generated the schools of Nuremberg, Augsburg, and other towns. When the classical revival spread north of the Alps, Gothic art ceased, and the so-called Renaissance reigned everywhere.

The Reformation came, and for a time ruined the arts (with the exception of music) which had grown up in the service of the medieval church. In some parts of Europe, the old traditions lingered on longer than elsewhere. Portraiture survived longer than other forms of art, and indeed culminated in excellence when ideal painting was already on the decline. The life of the 16th century was a life of action, and the art of action (*drama*) was naturally the one most cultivated. Painting, then, was succeeded by drama, the age of Raphael by that of Shakespeare. A school of painting, however, flourished in the Low Countries when the art was practically dead everywhere else. Under the protection of drama, music also developed until that art in turn reached the highest level. Meantime the art of painting had also revived, and schools of a new character arose in different countries. These schools have developed in different directions, and felt the influence of the contemporary literary and scientific movements which have gone on about them. The Romantics of Germany and the Pre-Raphaelites of England have been thus produced. It will be for future generations to estimate the value of these and similar modern schools.

In the preceding historical sketch, the arts of the East have been but slightly referred to. The Chinese school probably arose spontaneously, and may afterwards have been affected by Chaldæan influences conveyed through Persia, and thence overland. The Japanese school is merely an offshoot of the Chinese. Median and Persian intermediaries likewise conveyed to India some dim traditions of the arts of the Semitic and Greek peoples. Under the influence of the Buddhist movement a national Indian art was created, and some of its finest monuments are to be found in the interior of Ceylon. Chaldæan traditions have been the foundation of all the arts of Western Asia.

The English style of painting was practically founded by Van Dyck, in the reign of Charles I. He was succeeded by Sir Peter Lely, and he in turn by Sir Godfrey Kneller. Richardson, Hudson, and other mediocre painters followed, the mass of their work consisting of portraits. In the 18th century, a revival was effected by Hogarth, Reynolds, and Gainsborough. Wilson painted landscapes in the classical style; Gainsborough introduced into the rendering of landscape a broader rendering of country scenes. Turner's art was primarily founded upon the classical style, but he united with that a direct appeal to nature, and by unbounded study he attained a skill of handling and a minute knowledge of nature in every mood, such as has never before or since been attained. Constable carried on the traditions of Gainsborough, and strongly influenced the landscape painters of France. The decline of landscape art in the present day is marked by increasing triviality on the one hand, and slovenliness on the other.

The impulse to decorate a useful object is one common to all mankind. It is merely to continue a little further the labour of simple manufacture. With this instinct is involved the equally natural impulse which drives men to imitate the objects seen about them, and by which they are chiefly interested. Landscape-painting, for example, is suggested by the desire to fix upon some portable surface the image of a view which pleases or

interests the draughtsman. But out of this effort at imitation arises a new desire—that of creation. The artist is not satisfied merely with attempting to copy what he sees. The study of nature fills his mind with thoughts of beauty; he conceives persons and scenes which he has never beheld, and the impulse arises in him to give visible form to such conceptions. Works produced in this spirit are new creations, and take rank as the highest form of art. Their excellence is determined by a twofold test. Is the thought itself fine? has it been duly expressed? In the works of early schools of art, we often meet with the finest thoughts expressed by very undeveloped means, and yet completely. In works of a declining school, the expressive power of the artists is generally great, but their thought feeble or mean. Complete powers of expression, themselves beautiful, and fullness of lovely and ennobling thought, are the marks of a culminating school. Every school of art arises in the wake of some new ideal which it endeavours to express. Some ideals are best expressed in monumental buildings, like the ideal of Persistence of the Egyptians. The Greek ideal of Reserve found its clearest expression in perfect sculpture. Each ideal exercises a formative power, and directs at once the desires and the hands of men. It wins for itself, step by step, clearer and nobler expression, and enjoys a brief time of perfect life. Then a decadence sets in, and after a longer or shorter period of transition or barrenness, another ideal arises to produce a new art. Such a transition can best be watched taking place in the 14th century, between the medieval ideal, which produced chivalry, feudalism, and Gothic architecture, and the Renaissance ideal, which produced the study of antiquity, the revival of learning, a tendency towards despotism in government, and the great schools of painting in Germany and Italy. It follows from this, that in every epoch there is one dominant art to which the rest are subsidiary. In the 13th century, architecture ruled. Painting and all the minor arts derived their forms from those developed in the service of architecture. The very binding of books was decorated with bas-reliefs. Ivory carvings were like little buildings.

It is impossible to draw a sharp line of division between fine and decorative art. Sculpture primarily intended to decorate a building, may be (as in the case of Notre Dame at Paris) amongst the finest, considered as pure sculpture. In a time of artistic culmination, almost everything that is made is endowed with something of the splendour of the supreme art. Nevertheless, one law can be stated to which all art, primarily decorative, must conform. Decoration must not interfere with the utility of the object decorated, but must rather express, or at all events be conformable (in spirit as in shape) to that utility. Giving to this same principle a wider application, we may deduce from it the law, applicable to all art whatsoever, that the material in which a work of art is executed must to some extent govern the style of the work. There is one style suitable for sculpture in granite, another for sculpture in marble, another for metal, another for wood. A figure rightly carved in the one substance would be wrong if copied into another. Again, the process of working has also to be taken into consideration in the design. A cartoon for a painting would not be suitable for translation into a stained-glass window, a tapestry, or a mosaic. Hence all mosaics copied from pictures are fundamentally wrong as works of art. In line-engraving, the lines are ploughed into a copperplate by the direct application of the strength of the engraver's arm. In etching, the copperplate is first covered with varnish, and then the varnish is scratched off in fine lines by the point

of a needle. The lines are afterwards bitten in by the chemical action of an acid. The artist's hand acts in the one case deliberately and with force, in the other swiftly and lightly. What, therefore, is suitable treatment in line-engraving is unsuitable in etching, and *vice versa*. In pen-and-ink drawing, the pen lays black lines on a white surface. In wood-engraving, the white spaces are cut out, and what is to print black is left standing in relief. A good pen-and-ink drawing, therefore, will make a bad woodcut.

All the decorative and many of the creative arts may likewise be considered as 'glorified handicrafts.' As long as an object is only intended for use, it is not a work of art. An object made purely for use may indeed be beautiful. If, like a ship or a water-wheel, it is made to be as it were used by the forces of nature, its forms are then as much dictated by the action of the forces of nature as the forms of a cloud or a hill, and it shares the beauty of all natural objects; but it is not a work of art. It is only when the workman goes beyond what is necessary for use, and consciously aims at giving also pleasure by his work, that he becomes an artist. Weaving is not an art, but tapestry-making is; it is the glorified handicraft of weaving.

Much has been written about the artistic or inartistic nature of certain peoples. Thus the ancient Greeks are considered an artistic race, the Romans inartistic. In all probability there is an artistic potentiality in every people. The ideal of the Greeks was representable, and their circumstances were at the time favourable to its representation. The Romans were chiefly employed in the government and administration of a large empire. Their ideal was not representable, and their energies were fully occupied in developing it in other than artistic directions. It is not the natural gifts so much as the condition and circumstances of a people at a given date that determine whether it shall be artistic or not. The French in the 13th century were the most artistic people in Europe. In the 15th century, the French produced relatively little of supreme excellence, whilst the Italians had in the meantime gone to the front. Art is primarily an expression of happiness, and a product of passion in leisure. When the passions of a race are fully occupied in the business of life, art languishes. It grows strong when a strong race is enabled by circumstances to devote its strength to joy. The passion of life in the present day is chiefly enlisted in scientific discovery. Art, therefore, is not the first thing in the life of any existing nation, and no supremely great school is at present culminating.

The bibliography of art is vast; but for the history of ancient art the reader may consult the works of Chipiez and Perrot; Fergusson's *History of Architecture*; Murray's *Greek Sculpture* (1880); Lord Lindsay's *Christian Art* (1847); Woltmann and Woermann's *History of Painting* (trans. by Colvin, 1880); Lübke's *History of Art*; Jameson's *Sacred and Legendary Art*; the South Kensington *Universal Catalogue of Works of Art*; W. M. Conway's *Early Flemish Artists*, and Ruskin's works. And see the articles *ÆSTHETICS*, *ARCHITECTURE*, *DRAMA*, *ENGRAVING*, *MUSIC*, *PAINTING*, *RENAISSANCE*, *ROMANTICISM*, *SCULPTURE*.

ART INSTRUCTION.—In the education of the artist, the first aim is to secure the power of outlining correctly in pencil from a copy, and after this has been attained, the pupil proceeds to add light and shade to his previous work in outline. The next step is to draw—or, if a sculptor is being trained, to model in clay—from the object itself, and for this purpose plaster casts of fruit, flowers, and leafage, and afterwards casts of statues, form the most convenient models. When sufficient power has been gained by these exercises, the pupil enters

the life-school, and works from the draped and the undraped human figure; if a sculptor, modelling the subject in clay; if a painter, rendering it in light and shade, and afterwards in colour. On leaving the life-class he is free to choose his own special department of art, but for the landscape-painter, and even for the decorative designer, as for the sculptor and the figure-painter, the fittest preparation and the most searching training lies in study from the human figure, though the latter require a knowledge of anatomy which is unnecessary in the case of the former. The training of the painter includes instruction in the various technical processes of oil and water-colour painting, as that of the sculptor includes instruction in the qualities and capabilities of the marble and other materials with which he works; while the architect requires a wider scientific knowledge, and a full acquaintance with the laws of mechanical construction.

In the early times of art the painter or sculptor was trained like any other craftsman. He entered the studio of some recognised practitioner of the art to which he meant to devote himself; and began, if under a painter, to prepare colours and to ground canvases, learning all that his master had to teach him; and finally he took part in the production of the monumental frescoes and even of the easel-pictures which were given to the public under the master's name. Gradually, however, the fine arts began to separate themselves more sharply from the other crafts. Their professors assumed a higher status than formerly. It became more and more the custom that an artist should finish with his own hand every portion of each work which issued from his studio. Academies of art were formed, and, in connection with them, art training was conducted by certified instructors. Thus a class of art-teachers, as distinct from artists, arose, a change not altogether favourable in its influence upon the future of art.

In England, one of the first efforts in the direction of systematic art training was made by Sir Godfrey Kneller, who in 1711 founded an institution for giving professional instruction in design. In 1724 Sir James Thornhill established a similar academy in his own residence; but several students seceded from his class, headed by John Vanderbank, who started a short-lived academy, in which study from the life was introduced. This was followed by the well-known St Martin's Lane Academy, founded by William Shipley, where for thirty years those who afterwards became the leading artists of the time received their training. It was superseded by the schools instituted by the Royal Academy after its foundation in 1768.

The establishment of the South Kensington Department of Science and Art marks an important epoch in the history of art instruction in England. It may be said to have arisen out of the report of a select committee of the House of Commons appointed in 1835 'to inquire into the best means of extending a knowledge of the arts and principles of design among the people (especially the manufacturing population) of the country.' On the recommendation of this committee a sum of £1500 was devoted to the establishment of a Normal School of Design, with a museum and lectures. The school was opened in 1837, and by 1851-52 the government grant for this school and its various branches throughout the country had attained the amount of £15,055. In 1852, in accordance with a report of a select committee, the scheme was reconstructed, and a 'Department of Practical Art' created, with Sir Henry Cole, K.C.B., as superintendent; and a Science Department was added in 1853. It was under the management of the Board of Trade till 1856, when it passed under the control of the Lord President and the Vice-

president of Council on Education. In 1886 the number of schools and branch schools under the Science and Art Department throughout Great Britain was 226, in which a total of 40,134 students were being trained. The South Kensington Museum, founded in 1851, has played an important part in the art education of the country.

In 1869 a great stimulus to art education was given by the foundation, through the bequest of £45,000 by Felix Slade, of the 'Slade Art Professorships' in the universities of Oxford, Cambridge, and London. These chairs have been held by Mr Ruskin and other persons of the highest eminence, and it is impossible to overestimate the good which may be expected to result from this effort to improve the taste and knowledge of the wealthier classes, in whose hands the patronage and direction of art in our country mainly rests.

In Scotland, a remarkable effort in the direction of art instruction was made by Robert Foulis, the well-known printer. In 1751 he visited the Continent, engaged drawing-masters, and purchased pictures, casts, and engravings; and on his return to Glasgow in 1753 he started a school of art. The classes were continued till about 1776, and were far from a pecuniary success; but they afforded training to such excellent artists as David Allan and James Tassie, and exercised a most important and beneficial influence upon Scottish art. In 1760 the Board of Manufactures in Scotland founded a school of art in Edinburgh which is still in active operation, and which, under the name of 'The Trustees' Academy,' has afforded instruction to almost every Scottish painter of distinction for more than a century and a quarter. In 1858 this school was affiliated with the South Kensington Science and Art Department, and it serves not only for the instruction of art-craftsmen in design, but also as a school for painters and sculptors preparatory to the life-class of the Royal Scottish Academy. In 1880 art instruction was brought within the scope of the Scottish university curriculum by the establishment of the Watson-Gordon chair of Fine Art in the University of Edinburgh, in memory of Sir John Watson-Gordon, P.R.S.A., through the bequest of a sum of about £12,000 by his brother and sister.

In Ireland there are classes in connection with the Royal Hibernian Academy for study from the antique and the life; and the Dublin Metropolitan School of Art is under the South Kensington Department.

Various continental schools, especially those of Munich and Antwerp, have attained celebrity; but Paris is now the great centre of art instruction, in which many British and American students have been trained. Since the time of J. L. David—who, when in exile, also influenced the school of Belgium—the French have been celebrated for their command over form; and, in recent years, their power as colourists has greatly increased. The Parisian method of study is admirably adapted for giving its pupils a certain technical dexterity. The *Prix de Rome* of the French Academy is a much-coveted distinction, insuring a residence for study in the Villa Medici, Rome.

ART UNIONS are the subject of a separate article; see page 469.

Arta (Turkish *Narda*, the ancient *Ambracia*), capital of a division of Thessaly, ceded to Greece by Turkey in 1881 (area, 395 sq. m.; pop. 31,178). The town stands on the left bank of the river Arta (the ancient *Aracthus*), 8 miles from its mouth in the Gulf of Arta (the ancient *Ambracian Gulf*), an arm of the Ionian Sea between Greece and Albania. It is the see of a Greek archbishop, and has a considerable trade. Pop. (1881) 4328, two-thirds Greeks.

Artabazus, the name of several distinguished Persians under the dynasty of the Achemenidae. When Xerxes advanced against Greece, an Artabazus led the Parthians and Chorasmians. At a later period he warned Mardonius, but in vain, against engaging in battle at Plataea; and on his defeat fled with 40,000 men, and reached Asia in safety.—Another Artabazus was general under the Persian king, Artaxerxes II., and afterwards revolted against Artaxerxes III. For this offence he was forgiven, through the exertions of his brother-in-law, Mentor, a favourite and staunch supporter of the next king, Darius, whom we subsequently find Artabazus faithfully attending after the battle of Arbela. Alexander rewarded his fidelity by appointing him satrap of Bactria.

Artanthe. See MATICO.

Artaxerxes (ancient Persian *Artakshashtra*), the name of several Persian kings. (1) **ARTAXERXES I.**, surnamed *Longimanus* ('long-handed,' no doubt from his wide-reaching power), the second son of Xerxes, after the conspiracy of Artabanus, which caused the death of the king, put to death his elder brother, and ascended the throne in 465 B.C. His long reign, extending for forty years, was marked by a decline of power.—(2) **ARTAXERXES II.**, surnamed *Mnemon* ('the mindful'), succeeded his father, Darius II., in 404 B.C. After the death of his rebellious brother Cyrus in the battle at Cunaxa, he became involved in war with Sparta, which ended with the peace of Antalcidas. He died in 358.—(3) **ARTAXERXES III.**, named *Ochus*, was the son and successor of the preceding. He found the empire falling to pieces, but did much to build it up again, and stave off the coming ruin. After putting down the revolts of Artabazus and Orontes, he subdued Phœnicia and Egypt, and reduced Cyprus. He mainly owed the conquest of Egypt to his general, Mentor, and him he rewarded with the satrapy of the west coast of Asia Minor. He outraged the religion of the Egyptians by desecrating their temples and slaughtering their sacred animals. He was poisoned in 338 by his favourite eunuch, Bagoas.—(4) **ARTAXERXES**, or *Ardeshir*, the founder of the new Persian dynasty of the Sassanidae, overthrew Ardavan (Artabanus), the last of the Parthian kings, and was hailed as 'king of kings' on the battlefield in 227 A.D. He next conquered Media and a large part of the Iranian highlands, but had less success in Armenia, and was defeated by Alexander Severus in a great battle in 233. He made most of the former vassal states of the Arsacidae into provinces of an empire, which he consolidated so well that it endured for four hundred years. He died in 242.

Artedi, PETER, a celebrated Swedish naturalist, was born in 1705. He studied for the church at Upsala, but soon betook himself to the natural sciences, having Linnæus for fellow-student and friend. He became specially distinguished in ichthyology; and having gone to England in 1734, he there completed his great work, the *Ichthyologia*, the first which gave a truly scientific character to the study of fishes. He was also a distinguished botanist. He went to Leyden in 1735, and in the same year was drowned in a canal near Amsterdam.

Artemis, a goddess of Greek Mythology, daughter of Zeus and Leto, twin-sister of Apollo, born with him in Delos, whence she is often called *Ortygia* from the ancient name of the island, or *Cynthia* from Mount Cynthus there. To the Greeks she was (1) a kind of feminine Apollo, armed like him with the bow, dealing plagues and death to beasts and men, but also healing diseases and averting evils. She has a special care over the

young of animals, and is therefore the goddess of the flocks and the chase. Her heart has never yielded to love. She slew Orion for an attempted insult, and changed Actæon into a stag simply because he had seen her bathing. As the sister of Apollo, regarded as identical with Helios ('the sun'), she came to be regarded as the goddess of the moon, corresponding to Selene, and latterly the worship of the two was amalgamated. (2) The Arcadian Artemis is merely a goddess of the nymphs, hunting together with them on the Arcadian mountains, drawn in a car by four stags with golden antlers. (3) In Attica and Sparta the goddess was worshipped under a somewhat sterner aspect, and the usages point back to original human sacrifices. According to tradition, Iphigenia, who had herself been about to be sacrificed to the goddess, brought her image from Tauris and set it up at Brauron in Attica, whence *Brauronia* became a name of Artemis. At Sparta boys were scourged at her altar until it was sprinkled with their blood. (4) The goddess worshipped as Artemis at Ephesus was originally a divinity of Asiatic origin, quite distinct from the maiden huntress of native Greek mythology. Instead, she personified the fructifying powers of nature, and her image was represented as many-breasted (*polymastos*), the attendants of her temple being eunuchs and women. The allusion to her worship as 'Diana of the Ephesians' in Acts xix. will be remembered.

By the Romans Artemis was identified with the ancient Italian divinity Diana, a goddess of light, representing the moon, corresponding to Dianus or Janus, a god of light, the sun. The attributes proper to Artemis were attached to her name.

In art Artemis is represented as a young and handsome huntress, her hair tied up around her head, modestly clothed in the chlamys, but with the legs bare below the knees. She carries the bow and quiver of arrows, and is attended by dogs or stags. As the moon-goddess, again, she is clothed in a long robe, her head covered by a veil, above her brow the crescent of the moon. Her most famous statue is the so-called 'Diana of Versailles,' found in Hadrian's villa near Tivoli, now in the Louvre. See Claus, *De Dianæ antiquissima apud Græcos natura* (Breslau, 1881); and Schreiber's 'Artemis' in Roscher's *Lexikon der Mythologie* (Leip. 1884).

Artemisia, queen of Caria from 352 to 350 B.C., was the sister and wife of Mausolus, and is celebrated for the magnificent mausoleum which she caused to be erected to her husband's memory (see MAUSOLEUM).—Another Artemisia, queen of Halicarnassus, accompanied Xerxes, with five ships, in his expedition against Greece, and distinguished herself at the battle of Salamis (490 B.C.); she ended her life, in consequence of an unfortunate attachment, by leaping from a rock.

Artemisia. See WORMWOOD.

Artemus Ward. See BROWNE, C. F.

Arteries (Gr. *artēria*, probably from *air-ein*, 'to raise,' but by some connected with *aēr*, 'air,' from the old idea that these tubes were air-carriers, since after death they are generally found empty), the vessels through which the blood passes from the heart to the tissues. The structure of an arterial tube is very complex, and a section of it may be roughly subdivided into three layers, called the coats of the artery: an external, consisting of interlacing bundles of fibrous tissue mixed with elastic fibres, which in large vessels such as the aorta are gathered together to form an elastic layer; a middle, which is muscular, contractile, and brittle, the fibres being arranged in a circular

direction; an internal, also brittle, the free surface being smooth and formed of a single layer of endothelial cells. External to these cells there is a layer of delicate connective tissue, outside which there is the elastic layer constituting the bulk of the inner coat, and distinguished by numerous perforations, causing its fenestrated appearance. The tube is also enveloped in cellular tissue, termed the *sheath* of the artery. When an

artery is wounded by a sharp instrument, the effect varies with the direction of the cut. Thus, if longitudinal, the edges may not separate, and the wound may heal without much bleeding; if oblique or transverse, the edges gape; and a nearly circular orifice allows of a profuse hemorrhage. If the artery be completely divided, its walls do not collapse like those of a vein, but pass through certain changes provided by nature to prevent fatal bleeding. The cut orifice contracts, and also retracts into its cellular sheath; this checks the flow of blood, a clot of which shortly forms on the outer side; then another forms inside the vessel; and together, they stem the flow, till the cut edges of the artery have time to throw out lymph (see ADHESION), and heal as wounds of other tissues. When an artery is compressed by a ligature, the brittle inner and middle coats crack and curl inwards. The interior of the vessel becomes filled with a clot which extends as far as the nearest collateral branch. Gradually the clot is absorbed and fibrous tissue deposited in its place, the result being that this part of the artery is entirely obliterated. See BLEEDING.

The arteries of the human body consist of two groups—those belonging to the lesser or pulmonic circulation, and those belonging to the greater or systemic circulation. All the offsets of the latter group are branches, more or less direct, of the aorta. As each main trunk passes into a portion of the body, it divides into two principal divisions: one, which breaks up into branches for the supply of the tissues in the vicinity—the artery of *supply*; and another, which passes almost branchless to supply the parts beyond—the artery of *transmission*. These, however, anastomose freely (see ANASTOMOSIS), so that the distant tissues are not solely dependent for their supply on only one arterial trunk. Thus the femoral artery divides in the groin into the profunda or deep femoral, to supply the thigh, and the superficial femoral, to supply the leg below the knee. Again, the common carotid divides into the external carotid, to supply the neck and head, and the internal carotid, to supply the brain. Although arteries have generally the same distribution or arrangement of branches, they frequently vary, and thereby are apt to puzzle a superficial anatomist. Some of the varieties are so common that it becomes difficult to decide which is normal. These peculiarities are often found as constant forms among lower animals, but in many cases they may be due simply to enlargement or diminution of vessels already existing. The principal arteries will be considered under their distinctive names, as at

Aorta (q.v.); and see CIRCULATION, BLOOD, HEART, VEIN.

DISEASES OF ARTERIES.—Arteries, like other organs of the body, are liable to acute inflammation (Arteritis); but this rarely occurs except as a consequence of inflammation in the neighbourhood of the vessel, or of obstruction of its tube (see below). By far the most common and important disease affecting arteries is Atheroma (q.v. for etymology). Atheroma is commonly a disease of advanced life, but may be found at any age. Its occurrence is favoured by any cause which produces greatly increased arterial pressure (occupations or amusements involving very great physical exertion, excessive use of alcohol), probably also by syphilis. It commences with a chronic inflammation, with greatly increased formation of cells in the outer layers of the inner coat of the arteries, perhaps also in the middle coat. This infiltration causes destruction of the natural tissues of these coats, and consequent loss of elasticity and contractility in the parts of the artery affected. The inflamed portions of tissue undergo fatty degeneration, and may either (a) become so softened as to be carried away by the blood-stream, or, more commonly, (b) become gradually calcified—i.e. converted into bony plates by the deposition in them of chalky matter. (a) A portion of the wall of an artery weakened in this way rarely becomes perforated, but frequently yields to the blood-pressure, becomes dilated, and forms an *Aneurism* (q.v.). (b) Calcification is much commoner, especially in old people, and may frequently be recognised in the superficial arteries by the hard feel the vessel has under the finger.

Atheromatous deposit is at first attended with a narrowing of the calibre of the vessel, varying with the thickness of the deposit, and most marked at the points of bifurcation. Smaller arteries may be completely obliterated, whilst the larger arteries may be very much contracted. Thus the common iliac has been found to have its canal diminished by about one-half, and the great ascending branches of the arch of the aorta, the subclavian and carotid arteries, have been found very nearly closed. A later consequence of the same disease is dilatation of the vessel. The elasticity of the outer coats being insufficient to contract the artery after the distension produced by each contraction of the left ventricle of the heart, it remains distended during the relaxation of the ventricle, and thus slowly expands; the enlargement being most marked at parts where there is most obstruction to the blood-current, as, for example, in curved arteries. These changes have also an effect on the retractile power of the arteries. A healthy artery, if cut across, may shorten to the extent of an inch or more; but the retractile power is destroyed by the deposition of bony rings or plates. But although incapable of shortening, the arteries sometimes become abnormally lengthened, and consequently become not only dilated, but also tortuous. All these changes produce great interference with the normal circulation of the parts whose arteries are affected; and where the disease is advanced, a cause that would otherwise be trivial may lead to serious results—e.g. softening of the brain, gangrene of the limbs, &c.

Another condition involving much danger is this: an ossified artery loses the smoothness which the interior of the vessel ought to present, and from the displacement or cracking of a bony plate, there may be sharp rough projections exposed, to which the fibrin of the circulating blood may adhere. These little clots becoming detached, may be carried with the blood till they become arrested, and plug up an artery, thus presenting cases of embolism or Thrombosis (q.v.). Again,

the relation of this disease to accidents and surgical operations on arteries is obvious. A blow or strain may rupture a diseased artery, when a healthy elastic vessel might have escaped injury. Such a slight movement as suddenly lifting the arm to the head, for the purpose of securing the hat in a sharp gale, has been known to be followed by aneurism of the axillary artery (Syme). A ligature applied to any calcified artery is very apt to cause it to break, and the difficulty of securing such vessels is often very great. It is to this form of disease that most of the failures of operations for aneurism are due.

Atheroma can be detected in the living subject only in its advanced stages, and its presence is often revealed by the occurrence of some secondary disease or symptom.

Another form of chronic inflammation of the arteries is met with in syphilis. It consists in a uniform thickening of the inner coat of the vessel, without the degenerative changes of atheroma, but with great diminution of its calibre, and consequent interference with the circulation. It is best seen and most important in the brain, where it often leads to softening.

Embolism is the name given to the obstruction of an artery by a plug carried to it from another part of the body. This may follow atheroma (see above), but is most commonly a consequence of the detachment of a mass of fibrin from a diseased heart. Any artery may be obstructed by embolism; the consequences are most serious in the brain, the retina, and the limbs. In the larger arteries of the brain, embolism causes symptoms and results very similar to Apoplexy (q.v.); in the retina, it causes sudden and often complete loss of vision (see EYE, *Diseases of*).

When the principal artery of one of the limbs is 'suddenly plugged in its higher part, a sensation of severe pain is commonly the immediate result of the accident. In some cases, the pain extends along the course of the vessel, which, though pulseless, is extremely tender; in others, the suffering is referred to some distant part of the limb, as, for instance, to the calf. Signs of a deficient circulation succeed, and they may amount to pallor, loss of temperature, numbness of the surface, or even to that torpor which is observed to precede the total death of a limb in certain cases of injuries of vessels.' Although Gangrene (q.v.) is always to be feared as the result of an obstructed artery of large size, it does not invariably follow; as a collateral circulation may be established, and the life of the limb may be thus saved. Very young persons will endure the obliteration of very large vessels without gangrene; and a case is on record in which 'all the main arteries of both upper extremities and of the left side of the neck were reduced to solid cords,' and yet no gangrene ensued. From the description of the symptoms, the nature of a case of sudden occlusion of a large artery by a plug may possibly be recognised, or at all events suspected, even by a non-professional observer. Medical aid must at once be sought. The early indications of treatment are to preserve the temperature of the part, to favour the establishment of a collateral circulation, to protect the limb from irritation or injury, to give nourishing blood-making food, and to relieve pain by the judicious use of opiates. The later treatment, if the affection is not checked, is that which is described in GANGRENE.

Arteriotomy, or the opening of an artery, is an operation that has been strongly advocated in those cases in which it is desirable to produce a more decided and immediate depletion of the cerebral circulation (as in severe forms of sanguinous apoplexy) than could be produced by ordinary

venesection. It is supposed by some surgeons to relieve pressure on the brain more efficiently than opening the jugular vein could do; and whether this is the case or not, it is a simpler and less dangerous operation. The only vessel operated on is either the temporal artery itself or one of its main branches, which is partially divided and allowed to bleed. The operation is a simple one, but should of course only be undertaken by a surgeon. To arrest the flow of blood when sufficient has been taken, the artery should be completely divided to allow its cut ends to retract; and after the surrounding parts have been sponged, a compress, or small pad, should be applied to the wound, and secured by a bandage, which must be carefully adjusted, so as, if possible, to remain undisturbed for four or five days, when it may be removed, and the wound covered with a strip of plaster.

Artesian Wells are perpendicular borings into the ground, through which water rises from various depths, according to circumstances, above the surface of the soil. The possibility of obtaining water in this way in a particular district depends on its geological structure. All rocks contain more or less water. Arenaceous rocks receive water mechanically, and according to their compactness and purity, part with a larger or smaller proportion of it. A cubic yard of pure sea-sand can contain about one-third of its bulk of water. It would part with nearly the whole of this into a well sunk in it, and regularly pumped from. Chalk and other rocks, composed of fine particles, closely compacted together, contain as large a proportion of water; but from the power of capillary attraction, little or none of this water would be drained into a well sunk in such rock. From the existence, however, of numerous crevices in chalk through which the water freely flows, and from the general presence of a larger quantity of water than the porous rock is able to retain, wells sunk in chalk often yield water. There is yet a third class of rocks, which are perfectly impervious to water: such are clays, which are absolutely retentive, neither allowing water to be obtained from them nor to pass through them. When such rocks occur in Basins (q.v.) in alternating layers, and in such order that pervious beds are inserted between impervious ones, it is evident that if a perforation is made through the retentive barrier-bed in the lower portion of the basin, the water contained in the water-logged strata will rise through the bore to a height depending upon the pressure of water which has accumulated in the confined sloping space between the two impervious beds. The explanation will be more evident by a reference to the accompanying figure, which may be considered as a diagrammatic section of the London

Section of the London Basin.

basin. There are here a number of porous beds, *b*, *b*, composing the cretaceous measures, resting on the impervious gault, *aa*, and these, again, are covered by the equally impervious series of the London clay, *cc*, which form the strata on the surface, and extend to a considerable depth. The edges of the chalk-beds are largely exposed in the higher grounds around London; the water falling on the

whole area of these exposed edges, sinks into the more or less porous cretaceous beds, and would, in course of time, by continued accessions, fill up the basin, were it not prevented by the clay above. By driving a bore, *d*, through this superior bed, the inferior water-logged strata are reached, and the subterranean water rises to the surface, and flows continuously, by means of hydrostatic pressure.

Many such wells exist in London and its vicinity; those which, since 1844, have supplied the ornamental fountains in Trafalgar Square descend into the upper chalk to a depth of 393 feet. The most famous artesian well perhaps is that of Grenelle, near Paris, which was bored in 1833-41, and whose water is brought from the gault at a depth of 1798 feet. It yields 516½ gallons of water in a minute, propelled 32 feet above the surface; temperature, 81°·7 F. An artesian well bored at Pesh in 1868-79, yields, at a depth of 3182 feet, water of a temperature of 165° F. In the United States, numerous artesian wells have been sunk, some of great depth, among which are two in St Louis, Missouri, 2197 and 3843½ feet deep respectively; several in Chicago of from 700 to 1200 feet in depth; one in Louisville, Kentucky, 2086 feet deep; one in Columbus, Ohio, 2775½ feet in depth, with many others from 500 to 2000 feet deep.

The Chinese and Egyptians were early acquainted with artesian wells. The oldest known in Europe is at Lillers, in Artois (hence the name *Artesian*), and was sunk in 1126. They have been in use for centuries in Austria, especially in the neighbourhood of Vienna, where formerly the boring for them was conducted in a rude and empirical manner. As soon as geology took the position of a science, and the theory of artesian wells was propounded, the engineer was able, after the geological survey of a district, to discover whether a supply of water could there be obtained in this way. Already, districts formerly dry and arid have received a plentiful supply of water by means of such wells, and many more applications have yet to be made. Artesian borings have been executed in the Sahara from remote antiquity, and new ones have been opened by the French in the Algerian Sahara with remarkable success. In the province of Constantine alone there are more than 150. The result is proving beneficial not only to the country materially, but also to the character and habits of its nomadic Arab inhabitants. Several tribes have already settled down around these wells, and forming thus the centres of settlements, have constructed villages, planted date-palms, and entirely renounced their previous wandering existence.

Artesian wells have supplied a portion of the data upon which the internal temperature of the earth has been calculated. They have their origin below that zone which is affected by the changing superficial temperature of the seasons, and consequently the water is of a constant temperature. Thus the Grenelle artesian well has a temperature of 81°·7 F., while the mean temperature of the air in the cellar of the Paris Observatory is only 53° MM. Arago and Walferdin observed the temperature as the work proceeded, and found that there was a gradual and regular increase downwards. Walferdin also made a series of very accurate and careful observations on the temperature of two borings at Creuzot, within a mile of each other, commencing at a height of 1030 feet above the sea, and going down to a depth, the one of 2678 feet, the other about 1900 feet. The results, after every possible precaution had been taken to insure correctness, gave a rise of 1° F. for every 55 feet down to a depth of 1800 feet, beyond which the rise was more rapid, being 1° for every 44 feet of descent.

Artevelde, JACOB VAN, a Flemish popular leader in the 14th century, was a wealthy and high-born brewer of Ghent. In 1335, when war was raging between England and France, he gave his support to the former power, while the Count of Flanders sided with the latter; and he actually concluded a treaty with Edward III. Proclaimed governor of Flanders, for nine years he was almost absolute ruler; but he went too far when, in 1345, he proposed that the Black Prince should be elected Count of Flanders. For this the Flemings were not prepared, and Artevelde was killed in a popular insurrection, July 24, 1345. His son Philip van Artevelde in 1381 headed a new revolt of the people of Ghent, and gained a victory over the Count of Flanders, the son of his father's old enemy. The count therefore sought the assistance of Charles VI. of France, and Philip was defeated and slain at Roosbeke, 1382. His history forms the theme of a fine drama by Sir Henry Taylor. See Hutton, *James and Philip van Artevelde* (1883).

Arthritis, inflammation of the joints. See JOINTS, RHEUMATISM, GOUT.

Arthropoda. In this great division of the animal kingdom, the body consists of a usually definite number of segments, each bearing a pair of hollow and almost always jointed limbs, into which the body muscles proceed.

In all cases, the epidermis gives rise to an external horny layer of *Chitin* (q.v.), which usually attains considerable strength and thickness, and in crustaceans is further strengthened by impregnation with salts of lime. The segments of the body and their corresponding appendages exhibit a considerable degree of differentiation, especially in the anterior region of the body, where also some or many segments may completely coalesce, their appendages also becoming extraordinarily modified for various functions; so that it requires the combined research of both the embryologist and the comparative anatomist to analyse the organism into its constituent parts. The nervous system consists of a brain above the mouth, and of a ventral chain of ganglia united by longitudinal and transverse commissures; a nerve-ring round the oesophagus connects the ventral chain with the brain above. One pair of ganglia is developed for each segment, although some of these also coalesce more or less completely in the adult.

The Arthropoda divide naturally into two great alliances—the water-breathers or Branchiata (see GILLS), and the air-breathers or Tracheata (see RESPIRATION); the former including the Crustacea, and the latter the Prototracheata or Peripatidea, the Myriapoda, the Arachnida, and the Insecta. The relation of the Arthropoda to other groups will best be understood from ZOOLOGY. Separate articles will be found on the CRUSTACEA, MYRIAPODA, ARACHNIDA, and INSECTS. A distinct class has been recently established for the genus *Peripatus* (q.v.), which persists as a survivor of the ancestral insects. In several of its characters, it links together the worm and arthropod types, and gives a new basis to Cuvier's union of the two under the title *Articulata*.

Arthur, king of the Siluri or Dumnonii—British races driven back into the west of England by the Saxons—is represented as having united the British tribes in resisting the pagan invaders, and as having been the champion, not only of his people, but also of Christianity. He is said to have lived in the 6th century, and to have maintained a stubborn contest against the Saxon Cerdic, but the Saxon Chronicle is suspiciously silent as to his warfare and as to his existence. Indeed the Welsh bards of the earliest period do not assert that he was a

contemporary, and it is more than doubtful whether he is an historic personage. It is worthy of remark that the fame of Arthur is widely spread; he is claimed alike as a prince in Brittany, Cornwall, Wales, Cumberland, and the lowlands of Scotland; that is to say, his fame is conterminous with the British race, and does not extend to the Goidels or Gaels. As is now well known, Great Britain was twice invaded by races of Celtic blood and tongue; the first wave was that of the Goidels, and after a lapse of some considerable time, a second Celtic wave, that of the Brithons or Britons from the east, overran Britain, and drove the Gaels to west and north. Finn and Ossian belong to the mythic heroic cycle of the Gaels, and Arthur and Merlin to that of the Britons. These several shadowy forms are probably deities shorn of their divinity and given historic attributes and position, much as, among the Norsemen, Odin, when he ceased to be regarded as the All-father or God, came to be reckoned as an ancestor of the kings.

In the lays of the Welsh bards, supposed to be as early as the 6th and 7th centuries (although no MS. is extant of older date than the 12th century), Arthur and his brave companions are celebrated, but modestly and without marvels. It is possible that there may have existed in the 6th century a prince bearing the already well-known heroic name; and if so, about him the myths belonging to the remote ancestor or god have crystallised. The legendary additions begin to gather in the history of the Britons by Nennius, a writer supposed to have lived at the beginning of the 7th century, but Mr Thomas Wright has shown (*Biographia Literaria*, Saxon period) that his history is a forgery of a much later date, probably of the 10th century. Mr Skene, however (*The Four Ancient Books of Wales*, vol. i. pp. 50-60), makes light to give Arthur an historic place, and we do not deny that there may have been a prince of that name. Next in order come the so-called Armoric collections of Walter, Archdeacon of Oxford (latter part of 11th century), from which Geoffrey of Monmouth (q.v.) professes to translate, and in which the marvellous and supernatural elements largely prevail. Here for the first time the magician Merlin comes into association with Arthur. According to Geoffrey, Arthur's father Uther, conceiving a passion for Igrna, wife of Gorlois Duke of Cornwall, is changed by Merlin into the likeness of Gorlois, and Arthur is the result. After his father's death, Arthur becomes paramount leader of the British, and makes victorious expeditions to Scotland, Ireland, Denmark, Norway, and also to France, where he defeats a great Roman army. During his absence, his nephew Modred revolts, and seduces Prince Arthur's wife, Gweniver (Gwenhwywar). Arthur returning, falls in a battle with his nephew, and is carried to the Isle of Avalon (q.v.) to be cured of his wounds. Geoffrey's work apparently gave birth to a multitude of fictions which came to be considered as quasi-historical traditions. From these, exaggerated by each succeeding age, and recast by each narrator, sprung the famous metrical romances of the 12th and 13th centuries, first in French and afterwards in English, from which modern notions of Arthur are derived. In these, his habitual residence is at Caerleon, on the Usk, in Wales, where, with his beautiful wife Guinevere, he lives in splendid state, surrounded by hundreds of knights and beautiful ladies, who serve as patterns of valour, breeding, and grace to all the world. Twelve knights, the bravest of the throng, form the centre of this retinue, and sit with the king at a round table, the 'Knights of the Round Table.' From the court of King Arthur, knights go forth to all countries in search

of adventure—to protect women, chastise oppressors, liberate the enchanted, enchain giants and malicious dwarfs, is their knightly mission.

The earliest legends of Arthur's exploits are to be found in the bardic lays attributed to the 6th and 7th centuries (*Myvyrian Archaeology of Wales*, 1801). A Welsh collection of stories called the *Mabinogion*, of the 14th and 15th centuries, and translated into English by Lady Charlotte Guest in 1849, gives further Arthurian legends. Some of the stories 'have the character of chivalric romances,' and are therefore probably of French origin; while others 'bear the impress of a far higher antiquity, both as regards the manners they depict, and the style of language in which they are composed.' These latter rarely mention Arthur, but the former belong, as Mr Skene puts it, to the 'full-blown Arthurian romance.' Chrétien de Troies, the most famous of the old French trouvères in the latter part of the 12th century, made the Arthur legend the subject for his *Romans* and *Contes*, as well as for two epics on Tristan; the Holy Grail, Peredur, &c. belonging to the same cycle. Early in the same century, the Arthurian metrical romance became known in Germany, and there assumed a more animated and artistic form in the *Parzival* of Wolfram of Eschenbach, *Tristan* and *Isolt* of Gottfried of Strasburg, *Erec* and *Iwein* of Hartmann, and *Wigalois* of Wirnt. The most renowned of the heroes of the Arthurian school are Peredur (Parzival or Perceval), Tristan or Tristram, Iwein, Erec, Gawain, Wigalois, Wigamur, Gauriel, and Lancelot. From France the Arthurian romance spread also to Spain, Provence, Italy, and the Netherlands, even into Iceland, and was again retransplanted into England. One of the publications that issued from the press of Caxton (1485), was a collection of stories by Sir Thomas Malory, either compiled by him in English, from various of the later French prose romances, or translated directly from an already existing French compendium. Copland reprinted the work in 1557, and in 1634 the last of the black-letter editions appeared. A reprint of Caxton's *Kynge Arthur*, with an introduction and notes, by Robert Southey, was issued in 1817 (*The Byrth, Lyfe, and Actes of Kynge Arthur*, &c. 2 vols. 4to). The most complete edition is that by Thomas Wright (Lond. 3 vols. 1866) from the text of 1634.

The name of King Arthur was given during the middle ages to many places and monuments supposed to have been in some way associated with his exploits, such as 'Arthur's Seat' near Edinburgh, 'Arthur's Oven' on the Carron near Falkirk, &c. What was called the sepulchre of his queen was shown at Meigle, in Strathmore, in the 16th century. Near Boscastle, in Cornwall, is Pentargain, a headland called after him 'Arthur's Head.' Other localities take his name in Brittany. In the middle ages in Germany, Arthur's Courts were buildings in which the patricians assembled. One such still remains at Danzig. There was one anciently at Thorn, about which a ballad and legend exist. Milton was meditating an Arthurian epic in 1639; and in our own day the interest of the legends about King Arthur and his knights has been revived by Tennyson's *Idylls of the King* (1859 *et seq.*), and some of Wagner's operas. We must not omit to note the magnificent life-sized ideal bronze figure of Arthur, cast for the monument of Maximilian I., now in the Franciscan church at Innsbruck, and regarded as the finest among the series of heroes there represented.

See Villemarqué, *Contes Populaires des Anciens Bretons* (1842); and his *Poèmes des Bardes Bretons du 6^e Siècle* (1850); Holtzmann, 'Artus' in Pfeiffer's *Germania*

(1867); San-Marie (A. Schulz), *Die Arthursage* (1842), and his *Beiträge zur Breton. u. Celt.-German Heldensage* (1847); also Rhys, *Celtic Britain* (1882); Grässe, *Sagenkreise des Mittelalters* (1842); Skene's *Four Ancient Books of Wales* (1868); Glennie's *Arthurian Localities* (1869); Cox's *Popular Romances of the Middle Ages* (1871); Fontan, *Arthur, ou le Roi-chasseur* (1874).

Arthur, PRINCE, the posthumous son of Geoffrey (Henry II.'s fourth son) by Constance, Duchess of Brittany, was born in 1187. On Richard's death in 1199, Arthur, by the law of primogeniture, should have succeeded to the English crown; and the French king, Philip II., upheld his claims, until John (q.v.) bought him over to a disgraceful treaty. Arthur soon after fell into his uncle's hands, and was imprisoned, first at Falaise, afterwards at Rouen, where, on 3d April 1203, he is supposed to have perished, either by assassination or by drowning in an attempt to escape. The story of John's orders to Hubert to put out his eyes was current as early as 1228, and is treated in a celebrated scene of Shakespeare's *King John*.

Arthur, CHESTER ALAN, twenty-first president of the United States, was born at Fairfield, in Franklin County, Vermont, on the 5th October 1830. His father was the Rev. W. Arthur, D.D., a Baptist minister, and a native of the north of Ireland. He distinguished himself as a student at Union College, New York; and devoting himself to law studies, was admitted to the bar in 1853. After having practised for some years, he was made a judge-advocate; at the outbreak of the great civil war he held the post of Inspector-general; and during the war was Quartermaster-general for the New York forces. He subsequently returned to law practice, and became the head of a very eminent law firm. Arthur took a prominent share in politics, on the Republican side; and in 1871 President Grant appointed him Collector of Customs at the port of New York. As being hostile to the reform in the civil service aimed at by President Hayes, he was removed from this post in 1878, and again returned to the practice of law. He was a leader of the Republican party in the State; and though belonging to the section of the Republicans opposed on the question of civil service reform to that represented by General Garfield, was made vice-president of the United States when Garfield became president in 1881. The death of Garfield, caused by the effects of an assassin's pistol-shot, called the vice-president to the supreme magistracy of the union; and Arthur was installed as president on the 22d September 1881, and held the office till 4th March 1885, when he was succeeded by Grover Cleveland, who had been the Democratic candidate. During his term of office two important measures were passed by congress in 1882—a bill dealing with the Mormon question, and declaring polygamy illegal, and the other dealing with the Chinese question. A tariff bill with Protectionist bearings was passed in 1883. He was neither a great nor a brilliant president, but he was practical, business-like, and honourable in the fulfilment of his duties. He died November 18, 1886.

Arthur's Seat, a well-known lion-shaped hill immediately east of Edinburgh, rising to a height of 822 feet above sea-level. The ascent is easy, and the prospect from the top unrivalled. Arthur's Seat is supposed to derive its name from the British king. When the hill received this appellation is not known; but at the close of the 15th century, the poet Kennedy mentions 'Arthur Sate or ony higher hill.'

The hill consists partly of aqueous sedimentary rocks, and partly of volcanic rocks. The aqueous strata are of carboniferous age, and are overlaid

by a succession of beds of basalt and porphyrite, with intercalated beds of fragmental volcanic materials. These bedded rocks are traversed by irregular sheets of dolerite and basalt, which form the mural cliffs of Salisbury Crags, Samson's Ribs, &c. The bedded igneous rocks point to subaqueous volcanic action in carboniferous times. At some subsequent period—long after the carboniferous strata had been elevated, folded, fractured, and much denuded—volcanic action again broke out on the site of Arthur's Seat. The rocks ejected at this later period are represented by the coarse volcanic agglomerate and overlying dolerite, &c. of the Lion's Haunch, and the basalt of the summit of the hill—this latter occupying the pipe or throat of the younger volcano.

Artichoke (*Cynara Scolymus*), a thistle-like perennial plant belonging to the tubuliflorous group of composites, now growing wild in the south of Europe, but probably a native of Asia. The radical leaves are 3 to 4 feet long, somewhat spiny, pinnatifid, or undivided. The stem is 2 or 3 feet high, branched, with large heads of violet-coloured (sometimes white) thistle-like flowers at the summits of the branches. The plant has been long cultivated for the sake of the delicate succulent receptacle or broadened axis of the flower-head, taken before the flower expands, which is boiled and eaten with melted butter, or sometimes eaten raw with salt and pepper. The part used is the same which is called the *cheese* in thistles by children, and is sometimes eaten by them. The tender central leaf-stalk is also occasionally used

Artichoke.

in the same way as that of the Cardoon. Several varieties are in cultivation, differing in the more or less spiny leaves, and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about 4 feet asunder, and 2 feet apart in the row. The artichoke bed continues productive for several years. Sea-weed is an excellent manure.—The Cardoon (q.v.) belongs to the same genus.—The Jerusalem Artichoke (q.v.) is a totally different plant, being a kind of sunflower (*Helianthus tuberosus*).

Articles of Association are the printed regulations for the conduct of the business of a joint-stock company registered under the Companies Acts. They are stamped as a deed, and signed by the subscribers to the memorandum of association. These two documents are then registered by the registrar of joint-stock companies, who grants a certificate of incorporation. Each member is entitled to have a copy of the articles and memorandum for one shilling. The Companies Act, 1862, gives in Schedule A, model regulations

(97 in number), which form the Articles of Association for every company limited by shares, except in so far as they may be expressly altered by the company. The most important articles deal with calls on shares, transfer of shares, forfeiture of shares, meetings, powers of directors, dividends, &c. See COMPANY.

Articles of War, ordinances for the government of troops, seamen, and camp-followers, by punishing, as crimes, acts or omissions which, in civil life, would be mere breaches of contract—e.g. desertion or disobedience of orders. *Military Articles of War* were, prior to the passing of the first Mutiny Act (q.v.) in 1689, the only ordinances for regulating discipline amongst the troops raised, from time to time, for each campaign. They were issued by the crown or by the commander-in-chief, in pursuance of authority conferred by the crown, for each campaign, and ceased to operate on its conclusion. This prerogative power, dating from the Conquest, was superseded in 1803 by a corresponding statutory power, expressed in section 69 of the Army Act of 1881, but not likely to be used. The earliest complete code, dated 1385, is the 'Statutes, Ordinances, and Customs' of Richard II. Articles of War were then issued by Henry V., Henry VII., and during the great Rebellion by both sides, in almost identical language; those of Lord Essex were published under an ordinance of the Lords and Commons. Charles II. and James II. also issued Articles of War. The former, dated 1672, formed the groundwork of those issued in 1878, which were consolidated with the Mutiny Act in the Army Discipline and Regulation Act of 1879, now replaced by the Army Act of 1881 (see ARMY DISCIPLINE); but the earlier Articles were of excessive severity—death or loss of limb for almost every crime.—The United States Articles of War are published in the annual Army Regulations, and cover generally the same ground as those of England. Sentences of death by courts-martial, as in the United Kingdom, must be concurred in by at least two-thirds of the members, and, with few exceptions, must be confirmed, before execution, by the president of the United States.

Naval Articles of War are similar in every respect to those for the army, and, like them, have been incorporated in a Naval Discipline Act, of which they form the first section. The power of the Admiralty to make Articles of War for the government of the Marines is recognised in section 179 of the Army Act, under which this body is disciplined when not borne on the books of a man-of-war in commission.—In the United States, marines are subject to the regulations for the army or navy, according as they happen to be engaged with either branch of the service; the Naval Articles being, however, essentially the same as those governing the army.

Indian Articles of War are a distinct and special body of regulations, and apply only to officers, soldiers, and camp-followers who are natives of India.

Articles, The Six, were imposed by act of parliament in 1539, when, Henry VIII. being displeased with some of the bishops most favourable to the Reformation, their opponents for a time regained the ascendancy. These articles asserted the doctrine of transubstantiation, declared communion in both kinds not to be necessary, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. The act imposing them was popularly called 'the six-stringed whip'. Severe penalties were appointed for writing or speaking against them, and for

abstaining from confession or the sacrament at the accustomed times, for priests failing to put away their wives, and for persons writing or speaking against the doctrine of transubstantiation. Archbishop Cranmer vainly opposed the act in the House of Lords: the king was resolute to have it passed. Its severity was mitigated by a subsequent act of his reign (1544), and although it continued substantially unrepealed, it was transgressed with impunity even by ecclesiastical dignitaries.

Articles, The Thirty-nine, of the Church of England, are the articles of religion which were agreed upon by the archbishops and bishops of both provinces and the whole clergy in the convocation held at London in the 4th year of Elizabeth, 1562, under Archbishop Parker. To have a clear view of the history of these important articles, we must go back to the promulgation of the original ones, forty-two in number, in the reign of Edward VI. The council appointed by the will of Henry VIII. to conduct the government during the king's minority, was for the most part favourably disposed towards the Reformed opinions, and the management of church affairs devolved almost entirely upon Archbishop Cranmer. In the year 1549, an act of parliament was passed, empowering the king to appoint a commission of 32 persons, to make ecclesiastical laws. Under this act, a commission of 8 bishops, 8 divines, 8 civilians, and 8 lawyers (amongst whom were Cranmer, Ridley, Hooper, Coverdale, Scory, Peter Martyr, and Justice Hales), was appointed in 1551, and one of its first acts was to draw up a code of articles of faith. These were forty-two in number, and were set forth by the king's authority in 1553. Strype makes it appear that these forty-two articles were agreed upon in the convocation that was sitting in 1552, but his assertion has been much questioned. Against Strype may be cited not only Fuller, but also Burnet, Lamb, and Palmer. But perhaps the best authority on the subject, Archdeacon Hardwick, in his *History of the Articles of Religion* (1859), makes it appear highly probable that Strype's view was correct. To these articles was prefixed the Catechism, and there is no doubt that Cranmer had the principal hand in their composition; for he owned before Queen Mary's commission that they were his doing. But immediately after their publication, Edward died, and one of the first acts of the convocation summoned with the parliament in the first year of Queen Mary, was to declare that these forty-two articles had not been set forth by the agreement of that House, and that they did not agree thereto. In 1558 Elizabeth succeeded her sister. In 1559 Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled up. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the Reformed Church. Parker applied himself to this work, and, for the purpose, revised the forty-two articles of King Edward, rejecting four of them entirely, and introducing four new ones—viz. the 5th, 12th, 29th, and 30th, as they now stand, and altering more or less seventeen others. This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of King Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of King Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to thirty-nine. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to

thirty-eight. From these thirty-eight there was a further omission—viz. of the first half of the 20th article, which declares that 'the church hath power to decree rites and ceremonies, and hath authority in controversies of faith.' As all the records of convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571 the articles once more underwent revision, Archbishop Parker and Bishop Jewel making a few trifling alterations, and the 29th being restored. The convocation which was then sitting ratified them both in Latin and English, and an act of parliament was passed in that year compelling the clergy to subscribe 'such of them as only concern the confession of the true Christian faith, and the doctrine of the Sacraments.' There still, however, remained some difficulty as to which was the authorised copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the thirty-nine articles as they now stand. 'His Majesty's Declaration,' which precedes them, and directs that they shall be interpreted 'in their literal and grammatical sense,' was prefixed by Charles I. in 1628.

It may be interesting to know from what other sources the thirty-nine articles are derived. Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording, with the Confession of Augsburg. The 9th and 16th are clearly due to the same source. Some of them, as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII., and annotated by the king's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it only existed in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melancthon.

The thirty-nine articles have been described as 'containing a whole body of divinity.' This can hardly be maintained. They contain, however, what the Church of England holds to be a fair scriptural account of the leading doctrines of Christianity, together with a condemnation of what she considers to be the principal errors of the Church of Rome and of certain Protestant sects. As far as they go (and there are many things unnoticed by them) they are a legal definition of the doctrines of the Church of England; though it is to the *Book of Common Prayer* that members of that communion look for the genuine expression of her faith. They were adopted by the convocation of the Irish Church in 1636, and by the Scottish Episcopal Church at the close of the 18th century. Corpus Christi College, Cambridge, contains the only copies of the Articles in manuscript or print that are of any authority. Amongst them are the Latin manuscript of the Articles of 1562, and the English manuscript of the Articles of 1571, each with the signatures of the archbishops and bishops who subscribed them.

See Hardwick's history of the Articles already cited. Amongst the commentaries upon them are those by Bishop Burnet (1669); Bishop Beveridge (1716); Bishop Forbes of Brechin (2d ed. 1871); and that most denounced by Anglican authorities, the exposition by Dr Harold Browne, Bishop of Winchester (Lond. 12th ed. 1882). *Tract XC.*, by Cardinal Newman, illustrated the 'elasticity' of the Articles. See also the articles CREEDS and CONFESSIONS.

Articula'ta or **ARTICULATED ANIMALS**, one of the great primary divisions of the Animal Kingdom, according to the system of Cuvier (see **ZOOLOGY**). It included those animals of which the body is divided into a number of distinct

joints—viz. the higher worms or Annelids, and also the Insects, Crustaceans, Arachnids, and Myriapods. The four latter groups were separated from the Annelida (q.v., and see also **WORMS**) by Von Siebold, on account of their possession of hollow jointed limbs, into a separate sub-kingdom, **Arthropoda** (q.v.).

Articulate Sounds. See **LETTERS**.

Articulation. See **JOINTS**.

Artificial Flowers, &c. See **FLOWERS (ARTIFICIAL)**, **STONES (PRECIOUS)**, **PEARLS, &c.**

Artificial Limbs are mechanical contrivances adapted to reproduce the form, and as far as may be, the function of a lost or absent member. They have, in one form or other, been in use from very early times. Herodotus mentions the case of a prisoner who amputated his own foot to escape from his shackles, and, escaping to his friends, was provided with a wooden substitute. The brave M. Sergius, great-grandfather of Catiline, was consul in the year 167 B.C. He lost his right hand in his second campaign; and received twenty-three wounds, so that neither his remaining hand nor his feet were fully serviceable. Notwithstanding this, he fought in four battles with his left hand only; afterwards he made himself an iron hand, and fighting with it fastened on, was instrumental in raising the siege of Cremona, in protecting Placentia, and in storming twelve of the enemy's camps in Gaul, during the second Punic war (Pliny, *Hist. Nat.* 28, 104-106). In 1885 a remarkable specimen was discovered in a tomb at Capua along with other relics dating from 300 B.C.; it is thus described in the catalogue of the London Royal College of Surgeons, where the specimen is preserved: 'Roman Artificial Leg.—The artificial limb accurately represents the form of the leg. It is made with pieces of thin bronze fastened by bronze nails to a wooden core. Two iron bars, having holes at their free ends, are attached to the upper extremity of the bronze. A quadrilateral piece of iron, found near the position of the foot, is thought to have given strength to it. There was no trace of the foot, and the wooden core had nearly all crumbled away. The skeleton had its waist surrounded by a belt of sheet bronze, edged with small rivets, probably used to fasten a leather lining.' The upper third of the leg was hollow, while the lower two-thirds were filled with wood.

The celebrated artificial hand of the German knight, Götz von Berlichingen—'Götz of the Iron Hand'—was invented about 1504 by a mechanic of Nuremberg. It weighed three pounds, and was so constructed as to grasp a sword or lance. In the twelfth chapter of Ambrose Paré's *Œuvres de Chirurgie*, as translated by Thomas Johnson in 1605, it is described 'by what means arms, legs, and hands may be made by art, and placed instead of the natural arms, legs, and hands that are cut off or lost.' No improvements worthy of record were made from the time of Ambrose Paré till the beginning of the present century, when Baillif of Berlin constructed a hand which did not exceed a pound in weight, and in which the fingers, without the aid of the natural hand, not only exercised the movements of flexion and extension, but could be closed upon and retain light objects, such as a hat, and even a pen. Recent years have seen great advances in the adaptation of these mechanical contrivances to varied requirements. The first desideratum in an artificial limb is lightness. This applies equally to both upper and lower extremities. In other respects, however, important differences exist between what is desirable in an artificial arm and what in an artificial leg. In the former, *mobility*, to the extreme limit

compatible with control over its movements, is wished for; in the latter, *stability* is chiefly thought of. The artificial arm is destined to reproduce as far as possible the prehensile powers of the lost upper extremity; the artificial leg, the weight-supporting function of the natural lower limb. In both, the mechanical appliance must fit accurately and grasp firmly the stump of the natural limb; and this without exerting injurious pressure or causing discomfort at any point.

Arms.—The utility of an artificial arm depends much on the nature of the stump. A stump above the elbow is most suitable when it tapers gradually to its lower end, and terminates in a rounded surface. When an arm is removed at the shoulder-joint, and there is no stump, an artificial arm can still be fixed in its proper place by means of a corset. In amputation below the elbow-joint, the best stump is one formed by amputation at the wrist. The simplest form of artificial arm after amputation above the elbow, consists of a leathern sheath accurately fitted to the upper part of the stump. The lower end of the sheath is furnished with a wooden block and metal screw-plate, to which can be attached a fork for holding meat, a knife for cutting food, or a hook for carrying a weight. The arm should be so carried as to represent the position of the natural arm when at rest. It is retained in its position by shoulder and breast straps, and forms a light, useful, and inexpensive substitute for the lost member. More complicated, and therefore more expensive pieces of apparatus are made, in which motion is given to the fingers, a lateral action of the thumb is obtained, the wrist-movements are partially imitated, and a degree of natural softness given to the hand by a covering of gutta-percha and india-rubber. Nothing has tended so much to the very highest development of artificial arms and hands, as an accident which happened more than a quarter of a century ago to the celebrated French tenor, M. Roger, who lost his right arm above the elbow. It was necessary, for his future appearance on the stage, that he should have an artificial limb, which would serve the purposes of histrionic action, and permit him to grasp a sword and draw it from its scabbard. Such a contrivance was invented in 1845 by Petersen, a Prussian mechanic, and the French Academy of Sciences commissioned MM. Gambey, Rayer, Velpeau, and Magendie to report upon it. The apparatus, which weighed less than 18 ounces, was tested upon a soldier who had lost both arms. By its aid he was enabled to pick up a pen, take hold of a leaf of paper, &c. Petersen's conceptions were improved by Messrs Charriere, the celebrated

Fig. 1.

The Beaufort arm (fig. 1) possesses a similar 'instinctive' power of movement. It consists of a wooden hand attached to a leathern socket that firmly fits the

stump. The fingers are half-closed parallel to one another, the first two finger-tips opposing that of the movable thumb. The thumb is pivoted on a pin concealed in the ball of the thumb; it is firmly pressed against the finger-tips by a strong india-rubber band similarly concealed. A piece of whipcord is attached to the back of the thumb, whence it runs upwards to the shoulder of the wearer, and across his back to the opposite shoulder, around which it is fastened by a tape loop. By drawing upon and relaxing the whipcord, the grasp of the thumb is alternately opened and closed; and these movements can be attained by slight movements of the shoulders, or by advancing and retracting the artificial arm. This arm was adopted by the French government for distribution to soldiers maimed in the Franco-German war of 1870-71. It is a remarkably efficient appliance, and has the advantage of cheapness, so that it is within the reach of all classes.

Legs.—The object in view here is to support weight, and to supply movement useful in progression. Weight can be borne in three ways in an artificial leg: (1) On the end of the stump; (2) by the contact-friction between the surface of the limb and a tightly fitting sheath; and (3) on the tuberosity of the ischium or 'sitting bone.'

The simplest artificial leg is the 'bucket' leg (fig. 2), consisting of a hollow wooden or leathern sheath, A, fitting accurately to the contour of the stump, and having a 'peg,' B, firmly attached to its lower end. The weight is here chiefly borne by the 'sitting bone,' which reposes on the smooth brim of the 'bucket.' The end of the stump should not quite reach the floor of the 'bucket,' hence it takes no part in supporting the weight of the body, which might give rise to pain in the stump. This appliance is suited only for amputation through the thigh. Its great defects are the absence of bending at the knee, and the absence of a foot, which makes it useless on soft ground.

Fig. 2.

Of the more complicated forms of artificial leg three are especially popular. The first of these is of English origin, and owing to its having been adopted by the Marquis of Anglesey, is known as the *Anglesey leg*; it is fully described in Gray's work on *Artificial Limbs*. The second is that invented by an American named Palmer, and called the *Palmer leg*. From its lightness and the greater ease of walking with it, it soon superseded the *Anglesey leg* in America. In the third, also invented in America, and known as *Dr Bly's leg*, the principal faults of the two other legs have been completely overcome. The advantages of this leg are thus summed up by Mr Bigg: (1) Adaptation to all amputations either above or below the knee. (2) Rotation and lateral action of the ankle-joint. (3) Power on the part of the patient to walk with ease on any surface, however irregular, as, owing to the motion of the ankle-joint, the sole of the foot readily accommodates itself to the unevenness of the ground. (4) The ankle-joint is rendered perfectly indestructible by ordinary wear, owing to its centre being composed of a glass ball resting in a cup of vulcanite. (5) The action of the ankle-joint is created by five tendons, arranged in accordance with the position

assigned to them in a natural leg. These tendons are capable of being rendered tight or loose in a few seconds, so that the wearer of the leg has the power of adjusting with precision the exact degree of tension from which he finds the greatest comfort in walking. (6) There is a self-acting spring in the knee-joint, urging the leg forward in walking, and imparting automatic motion. (7) The whole is covered by a flesh-coloured enamel, which can be washed with soap and water. (8) At the knee-joint there is a mechanical arrangement representing the crucial ligaments, and affording natural action to that articulation by which all shock to the stump in walking is avoided. Hermann's artificial limb is still more highly approved by many, as affording more support when the knee is bent. See Max Schede's work on Amputation, and the *System of Surgery* by Holmes and Hulke (3d ed. 1883).

The Beaufort leg (fig. 3), invented by the Count de Beaufort in 1851, and improved subsequently,

Fig. 3.

has three great recommendations: it lengthens the stride that can be safely taken, it reproduces the natural gait, and it is remarkably cheap. Baron Larrey, the celebrated French surgeon, reported on this invention to the Academy of Medicine, that 'it consists of a piece of ash-wood, which, like the peg, is attached to the ordinary wooden leg. It replaces the metal disc of the peg, and is shaped somewhat like a foot, but shorter in length. The plantar surface is covered with a leathern sole, garnished with cork at the heel. It is curved

in form, the curve being such as to give the limb continuous lines of bearing on the ground while the body moves forward, save that the curve is not so perfectly uniform as to involve any danger of slipping.' He shows how the curved sole is instrumental in increasing stability, in lengthening the pace, and in giving it a natural character. In 1865 this new form of foot was adapted to a new leg-case, with lateral supports of ash-wood, and a joint corresponding to the knee, applicable to cases of amputation of all sorts. These limbs are now made in London by the Provident Surgical Appliance Society. For artificial eyes, noses, palates, teeth, see EYE, RHINOPLASTIC OPERATIONS, PALATE, DENTISTRY, TEETH.

Artillery originally meant any projectile weapon or engine of war, even bows and arrows and slings; now it means either cannon of any description or the soldiers who manage the cannon. It is here used in the latter sense; the description of various kinds of ordnance will be found either under CANNON or under their special names. *Park of Artillery* is a collective name given to the whole of the guns, carriages, ammunition, and other appurtenances essential to the working of a field or siege army.

Artillery Corps.—The introduction of field-guns necessitated the formation of a body of men set apart to study the force and action of gunpowder, the flight and range of projectiles, the weight and strength of cannon, and the manœuvring of heavy masses of field artillery; and after the great wars

in the beginning of the present century, artillery had become the third great branch of military service, after the infantry and cavalry.

Artillery is divided into two classes, field and siege (sometimes called fortress or garrison artillery). The former is divided into *Batteries* (q.v.) as tactical units, and, besides the highly trained horse, field, and mountain, there are rocket and position batteries formed when necessary. In time of peace, a few of the latter class exist in India, where the guns are drawn by bullocks and manned by men of the garrison artillery. Siege or fortress artillerymen are grouped into regiments, battalions, &c., like infantry, for administrative purposes, in all armies except that of Great Britain (see below). Marine artillerymen, though belonging to the navy and working ships' guns, are to be classed as siege artillery. They are organised like infantry.

The *Royal Regiment of Artillery* is the collective name for the whole of the artillery belonging to the British army. Formed first in 1715, constant additions have been made to the same regiment, and it is now almost an army in itself, comprising *Horse, Field, and Garrison Artillery*. Many schemes have been originated for dividing this regiment at least into two branches, mounted and dismounted, but never fully carried out. The horse artillery, however, is separately recruited, and except that the officers revert to field or garrison artillery on promotion to await reappointment to it, may be considered a different regiment. In action, the horse artillery, having all the men mounted either on horses or on the limbers of the guns, can manœuvre with cavalry; the field artillery, carrying the gunners on the guns and wagons, and being armed with a heavier weapon, cannot move at such a rapid pace except for very short distances. The garrison artillery sometimes furnishes men to accompany guns of position (20-pounders or 40-pounders) dragged at a walk on to the field of battle by cart-horses, bullocks, or elephants, and it also mans the mountain batteries in India; but its proper duty is to work the heavy guns of forts or siege batteries.

The *Coast Brigade* consists entirely of old soldiers who are stationed in the small coast-forts, charged with the duty of looking after the magazines, stores, and guns in them. There are generally two men to each fort, and a master-gunner (see WARRANT OFFICER) superintends one or more forts under a district officer from the nearest regular battery of artillery. The officers of the coast brigade (1 major, 10 captains, and 19 lieutenants) are always promoted from the ranks, and generally placed in charge of large stores and important magazines; some act as adjutants for their districts.

In 1857, after the Indian Mutiny, the native gunners of the Bombay, Bengal, and Madras regiments of artillery were disbanded, and the officers amalgamated with those of the old Royal Artillery, but their promotion continued on their own seniority lists. These officers are gradually disappearing. A major-general holds the appointment of inspector-general of artillery, and visits every fort and sees every man in the regiment at home yearly. A deputy-adjutant-general at the War Office represents it on the general staff of the army.

A horse or field battery has 5 officers (1 major, 1 captain, and 3 lieutenants) and 151 men; and a garrison battery, 4 officers (1 major, 1 captain, and 2 lieutenants) and from 100 to 150 men, according to the guns of position in its charge. The horse artillery forms two brigades, lettered A and B, of 10 batteries each, also lettered and grouped thus for administrative purposes only. There are four similar brigades of field artillery.

These are numbered, but their batteries (20 to 23 in a brigade) are lettered. Each horse or field brigade has also a *dépôt* battery. Some batteries are armed with the new 13-pounders, some with 12-pounders, and some 9-pounders, and 12 field artillery batteries with 16-pounders. The garrison artillery is divided into 11 brigades (of 9 to 10 batteries), and each is allotted to a district or artillery division, becoming the first brigade of that division, the territorial militia artillery forming the other brigades. There is a *dépôt* battery at each divisional headquarters, recruiting from the district for the service batteries. The men enlist as 'gunners' or 'drivers,' according to their height; the standard being 5 feet 6 inches for the former, and 5 feet 4 inches for the latter. They serve 6 years, and then pass to the reserve for 6 more.

The following table from the Army Estimates of 1887-88, shows the numbers of the force :

ROYAL ARTILLERY.	
Commissioned officers.....	1,072
Non-commissioned officers.....	1,807
Rank and file.....	25,470
Horses.....	7,576
ROYAL HORSE ARTILLERY.	
Commissioned officers.....	181
Non-commissioned officers.....	271
Rank and file.....	3,978
Horses.....	3,844
Total men.....	32,779
Total horses.....	10,920

Of this number, some 12,000 men (80 batteries) are placed at the disposal of the East Indies, to be paid for out of Indian revenues.

The *Royal Malta Fencible Artillery* is practically a local regiment of artillery militia, though officially ranking, as part of the regular army, next after the 2d West India Regiment. It does not serve anywhere but at Malta.

The *Royal Lascars* of Hong-kong and Ceylon are also local militia, but are enlisted for universal service.

The *Honourable Company of Artillery* is the oldest existing volunteer corps in Britain. Together with the *Sergeants-at-arms*, the *Yeomen of the Guard*, and the *Gentlemen Pensioners*, it was established as far back as 1537, when Henry VIII. granted a patent creating the 'Fraternity or Guild of Artillery of Long-bows, Cross-bows, and Hand-guns.' In 1638 the corporation of the city of London presented to the company the Artillery Grounds, near Moorfields, for military exercises. Royal princes frequently enrolled themselves as members of the company, usually as 'captain-general.' In 1780, during the 'Lord George Gordon riots,' this company effectually protected the Bank of England; in 1848, and again in 1859, it was ready if needed, but has never been engaged in actual warfare with an enemy. Its members, elected by the ballot of a Court of Assistants, pay two guineas annual subscription, and £5 entrance fee, and supply uniforms, but not arms and accoutrements. They learn rifle-shooting as well as artillery practice; meeting twice a week at Moorfields, and every summer spend some days in camp. The corps comprises six infantry companies; a troop of light cavalry, who furnish their own horses; and a battery of artillery, as well as a company of veterans. Until 1849 the members elected their own officers; but since that year the crown has appointed them. The lieutenant-colonel appoints the non-commissioned officers. The total number, of all arms, is about 600. The company is the only volunteer body allowed to march through the streets with bayonets fixed. See G. A. Raikes, *History of the Hon. Artillery Company* (2 vols. 1878-80).

Artillery Schools.—The first school for artillery instruction was established by the Venetians in the beginning of the 16th century. Soon afterwards Charles V. established similar schools at Burgos and in Sicily. The French founded a school of practical artillery in 1675; and in 1679, a theoretical school at Douai. At present France has seven such establishments. Saxony had an artillery school in 1766; but the other German states were more tardy in this work. In Prussia alone the artillery and engineer schools are combined; but in other states these two arms are separate. The officers' studies comprise mathematics, as much of physics and chemistry as is necessary to the duties of the artillerist, field and permanent fortification, tactics, military history and topography, drawing, &c. The practical exercises include gun and mortar drill, siege operations, laboratory and manufacturing studies.

A *Royal Military Academy* was established at Woolwich in 1741, for the artillerists and engineers of the royal army. The East India Company sent their artillery cadets to this academy from the year 1798 to 1810; but afterwards, until 1861, they maintained a separate establishment at Addiscombe (which, however, was not wholly for artillery). The students in the academy are admitted by fair open competition, between the ages of 17 and 20; and remain two and a half or three years, before being commissioned in the Royal Artillery or Engineers. The sons of military officers are admitted on lower terms than those of other persons. There are 22 professors and instructors of various kinds. There is also at Woolwich a *Department of Artillery Studies*, for the instruction of junior officers of artillery; an *Ordnance Select Committee*, for examining and reporting on the numerous inventions relating to artillery brought before the War Office; and the *Artillery College*, consisting of a few officers in training for the superintendence of the manufacturing departments in the Royal Arsenal. The members pass a severe qualifying examination, and attend lectures on theoretical gunnery, chemistry, applied mathematics, and metallurgy. The *School of Gunnery* at Shoeburyness is for experiments upon ordnance, gunpowder, and projectiles, and to exercise young artillery officers in the practical and mechanical duties of their profession.

In the United States, the principal artillery school is at Fortress Monroe, in Virginia. Here, under three artillery field-officers, five batteries (one from each artillery regiment of the army) are in constant training, together with such officers and men as may from time to time be ordered to the school for instruction.

Artiodactyla. The great mammalian order Ungulata (see MAMMALIA, UNGULATA) is divided into two groups; first, the Perissodactyla, including the horse, tapir, and rhinoceros, besides a multitude of extinct forms, and distinguished by the third digit of each limb being symmetrical in itself, by the presence of an odd number of digits on the hind-foot, by the number of dorso-lumbar vertebrae being at least twenty-two, and so on; while the second sub-order, the Artiodactyla, possess the third digit, unsymmetrical in itself, but forming a symmetrical pair with the fourth digit. While the hind-foot bears an even number of digits, the number of dorso-lumbar vertebrae never reaches twenty-two, and rarely exceeds nineteen. Numerous minor osteological differences exist between the two sub-orders, which broadly correspond to the ancient divisions of solid-hoofed and cloven-hoofed respectively. In the article FOOT will be found some details as to the differences in the feet of various animals of the ungulate order.

The Artiodactyla again divide into two groups

—the Non-Ruminantia and the Ruminantia. The former have usually more than one pair of upper incisors, and the molars have a more or less tuberculated pattern, whence they are frequently termed Bunodontia. The metacarpal and metatarsal bones remain separate, and there are no horns. The stomach has rarely more than two divisions. The Non-Ruminantia include two existing families, Suidæ and Hippopotamidæ. The Suidæ (pigs) have the skin moderately thick and hairy; the third and fourth toes are much longer than the second and fifth. The teeth are frequently as many as forty-four, and the molars are multituberculate. The Hippopotamidæ have the skin extremely thick, with scanty hairs; the head, body, and limbs extremely massive; and the four toes all resting on the ground. The Ruminantia have never more than one pair of upper incisors. In the lower jaw, the canines closely resemble and are situated beside the six incisors, which thus seem to have increased to eight. The molars bear a double series of crescentic ridges, whence the name Selenodontia is frequently applied to the ruminant group. The stomach has at fewest three, and usually four divisions. Thus in the sheep or ox, the cardiac portion of the stomach is differentiated into the enormous rumen or paunch, and the reticulum or honeycomb stomach, with which it communicates. After the fodder has been chewed again, it passes readily into the third division, the *psalterium*, or manyplies, which acts as a filter, and only allows the finely comminuted portions of the food to enter the highly glandular *abomasum* or rennet stomach, in which gastric juice is secreted, and proteid digestion goes on.

The existing groups of ruminants are the Tragulidæ, the Cotylophora, and the Camelidæ. The Tragulidæ (sometimes erroneously termed musk-deer) are the least differentiated forms, and show interesting affinities to the non-ruminants. The Cotylophora, including the ox and deer tribes (Bovidæ and Cervidæ), are the central family, which are broadly distinguished by the cotyledonary placenta, and the structure of their horns; those of the Cervidæ being naked, deciduous, and annually renewed processes of the frontal bones; while those of most Bovidæ (sheep, antelopes, oxen, buffaloes) are non-deciduous processes of the frontal bones, covered by the thickened and hardened epidermis known as horn. But in one sub-family, the giraffes, the horns arise as separate ossifications, and are covered by hairy skin.

The third family, the Camelidæ, are aberrant ruminants. They walk on broad integumentary cushions, developed below the phalanges of the third and fourth toes, which are alone developed, the nails not forming hoofs. Large pointed canines are present in each jaw. The stomach has a characteristic structure. The placenta is diffuse. There are only two existing groups—the Camels of the Old World, and the Llamas of the New.

See RUMINANTIA, BOVIDÆ, DEER; also FIG, HIPPOPOTAMUS; ALPACA, ANTELOPE, BUFFALO, CAMEL, GIRAFFE, LLAMA, OX, SHEEP, &c.

Artocarpa'ceæ, a natural order of Monochlamydeous dicotyledons, of which the Bread-fruit (*Artocarpus incisa*) is the most familiar example; it is usually extended to include the tribe of mulberries and figs (Moraceæ), and with them is often grouped as a sub-order of the great nettle family, Urticaceæ, but by Baillon under Ulmaceæ. The Artocarpaceæ proper are almost all tropical trees, and include many highly useful species, as well as some deleterious to man. The milky juice of some yields Caoutchouc (q.v.); and that of a few species is so bland as to be used as a substitute for milk (see COW-TREE). The juice of others is, however, very poisonous, as that of *Antiaris*

toxicaria, the poison usually called Upas by the Javanese. The fruits are wholesome; the importance of Bread-fruit in the South Sea Islands is well known; and the seeds of the Musanga of the Gold Coast of Africa, and of *Brosimum alicastrum* in the West Indies, are eaten as nuts. The fibrous bark of the Bread-fruit tree is made into cloth; its wood is used for building, its male catkins for tinder; its leaves serve as substitutes for table-cloths and wrapping-papers, and its milky juice for bird-lime. The bark of *Antiaris saccidora* is used in Western India for making sacks, which are formed by cutting a branch of the dimensions of the sack wanted, and simply turning back and drawing off the bark after it has been soaked and beaten, the wood being sawn off so as to leave a little portion to form the bottom of the sack. The fibrous bark of *Cecropia peltata*, or Trumpetwood, is used for cordage. The stem and branches are hollow, and are used for wind-instruments. The wood of some species is valuable, such as Letterwood (q.v.). The wood known as *fustic* is *Machura tinctoria*, and *M. aurantiaca* (Osage Orange) also yields yellow stain. See BREAD-FRUIT, UPAS; also FIG, MULBERRY.

Artois, an old province in the north of France, bounded by Flanders and Picardy, and almost corresponding with the modern department of Pas-de-Calais. Its capital was Arras. Louis IX. in 1237 made Artois a county, and gave it to his brother Robert. Afterwards it passed into the hands of Flanders and Burgundy, but was ceded to France by treaties in 1659. Charles X., in his early life, and also after his abdication, was known by the title of Count d'Artois.

Arts. The term 'Arts,' or 'Liberal Arts,' as technically applied to certain studies, came into use during the middle ages, and on the establishment of universities, the term 'Faculty of Arts' denoted those who devoted themselves to Science and Philosophy, as distinguished from the faculty of Theology, and afterwards of Medicine and Law. The number of 'Arts' embraced in the full medieval course of learning was seven: Grammar, Logic, Rhetoric (constituting the *Trivium*), Music, Arithmetic, Geometry, and Rhetoric (the *Quadrivium*). The terms Master and Doctor were originally applied synonymously to any person engaged in teaching. In process of time, the one was restricted to the liberal arts; the other to Divinity, Law, and Medicine. See DEGREES, UNIVERSITY.

Art Unions. Art unions are associations having for their object the promotion of an interest in the fine arts, and a more liberal patronage of them by the public. Though the origin of these unions seems to belong to the French, it was the Germans who fostered and developed them into the important aids to art they have since become. The Art Union of Munich was formed in 1823, and within ten years of that date, nearly every town of any consequence in Germany had one. Many of the German associations also directed their attention to the formation and encouragement of permanent galleries of art and other kindred objects; that of Cologne greatly assisting in the completion of its celebrated cathedral.

The first union in Britain was established in Edinburgh in 1834, at which time the patronage of the fine arts had reached such a low ebb, that, excluding portraits, the amount expended in the purchase of pictures in the Scottish Academy's annual exhibition was sometimes as low as £35, and never more than £300. The success of the association was immediate, and to its founders the public are in no small degree indebted for the rapid progress which art has made in this country

during the last thirty years. It has otherwise followed the example of the German unions, inasmuch as nearly every year it purchases an important work of art, a picture or a statue, which is placed in the permanent National Gallery. Similar associations immediately followed in London and Dublin, and now almost every large town which has an annual art exhibition has also its art union. These associations are nearly all constituted alike, and consist of any number of individuals paying a certain sum, usually a guinea per annum, towards a fund, which, after deducting necessary expenses, is mainly devoted to the purchase of works of art for distribution as prizes to the subscribers.

The distribution is effected on the lottery principle, but a diversity of practice exists in the method of expending the funds. As this diversity has given rise to much controversy, it may be briefly explained. Firstly, the method common on the Continent, and adopted in Edinburgh, consists in putting, year by year, the whole sum to be devoted to the purchase of works of art, into the hands of a committee of gentlemen, who are chosen for their supposed taste in such matters, and requesting them to purchase pictures and other works of art for distribution by lot to the subscribers. Secondly, the plan followed by the London Art Union is to distribute the money itself by lot, and to insist on the prize-holders expending their prizes in pictures, selected by themselves, from certain exhibitions. If the object of the associations is to cultivate a taste for higher art than exists in the general community for the time being, then there is no doubt that the first method is the true one.

The weak point of art unions is the expense of management, which in some cases is a very high percentage of the total sum subscribed; and it may even be doubted whether, now that the patronage of art has grown to its present dimensions, they have not outlived their usefulness.

The difficulty of distinguishing between the lottery as part of the art union, and lotteries of an unquestionably illegal kind, led in 1846 to the passing of a special act for legalising *bona-fide* art unions, maintained solely for the encouragement of art. Unions, however, to be legal, must be incorporated by royal charter, or the instrument constituting the association and their rules be previously approved by the Privy-council. See EXHIBITIONS, LOTTERIES.

Artvin, a town of Russian Armenia, on the Charuch, 34 miles S. of Batum. Pop. 8000.

Arum. See ARRU.

Arum, a genus of spadiceifloral monocotyledons, belonging to the natural order Araceæ or Aroidæ. This order is chiefly tropical, and comprises herbaceous plants, some of which are stemless; shrubby plants, some of which are arborescent; and plants which climb by aerial roots, clinging to the trees of tropical forests. The leaves are sheathing at the base, convolute in bud, usually with branching veins. The small degenerate flowers are crowded upon the elongated axis or *spadix*, which is generally inclosed by a large bract or *Spathe* (q.v.), frequently coloured or white: the male flowers are aggregated at the upper part of the spadix, and the female flowers towards its base. In some species, a stench like that of carrion is produced during flowering, as well as a remarkable degree of heat. Plants are of course slightly warmer than the air around them, the heat being produced by the breaking up and oxidation of their protoplasm, and by the true respiration, in short, which goes on in all living tissues (see ANIMAL HEAT); but flowers,

in general, are only 1° or 1½° warmer than the air, whereas the flowers of some of the Arums and nearly allied plants are sensibly warm to the touch, and that of *A. cordifolium* has been found to have a heat of 121° F., when that of the air was only 66° F.—The only British species is *A. maculatum*, Cuckoo-pint or Wake-Robin, which is abundant in England, and in most parts of Europe, growing chiefly in moist shady woods and under hedges. It has a tuberous perennial root; its leaves are all radical, on long stalks, strongly arrow-shaped, often spotted; the spathe greenish yellow, inclosing a rather short violet or brownish-red spadix. It produces scarlet berries, 1-2 seeded, about the size of peas, clustered upon the spadix. The root has a burning acid taste, which, however, it loses in drying or boiling. In a fresh state, it is a drastic purgative, too violent for medicinal use; and, indeed, it, as well as the leaves, is an active poison; yet a nourishing farina is prepared from it, after the acid juice has been removed. This farina is a pure starch, and is known in England by the name of Portland Sago or Portland Arrowroot. It was formerly prepared to a considerable extent in the Isle of Portland, where also the tubers (corms) themselves were eaten by the country-people. They lose great part of their acidity in drying, and were formerly used in medicine as a stimulant in impaired digestion, a diuretic in dropsies, and an expectorant in chest complaints. The plant is cultivated in India for food.—*A. indicum* is also cultivated in Bengal for its esculent stems and small pendulous tubers.—Acridity in the juice, and the presence of an abundant and nutritive store of starch, from which the acid juice is easily separated, are characteristics of many plants of this order, particularly species of *Caladium* and *Colocasia*, much used for food in warm countries, under the names Cocco (q.v.), Eddoes, &c.—*Amorphophallus campanulatus* (*A. campanulatum*), called Ol by the Bengalese, is cultivated in some parts of India for its corms, which form a very important article of food; yet in a fresh state it is so acrid that it is employed as an external stimulant. The peculiar acridity of the order is most remarkably displayed in *Dieffenbachia*, the Dumb Cane (q.v.).—Two large species of *Arisæma*, another genus very closely allied to Arum, were found by Dr Hooker to afford food to the inhabitants of the Sikkim Himalaya at an elevation of upwards of 10,000 feet. Their tuberous roots are bruised by means of wooden pestles, and thrown into small pits with water, until the commencement of acetous fermentation, when the acidity is mostly dissipated; but the process is so imperfect that cases of injury from the poisonous juice are frequent. The tubers of *Arisæma atrorubens*, a native of the United States, and there known as Dragon-root and Indian Turnip, yield a pure white starch like that of *A. maculatum*.—The Dragon-plant, *A. Dracunculus*, a native of the south of Europe, is sometimes seen in gardens in Britain, despite its carrion-like smell.—The so-called 'Lily of the Nile,' so commonly used as a decorative plant in this country on account of its white spathes and large leaves, is *Richardia* (*Calla*) *æthiopica*.

Arum maculatum:
A, flower-stalk within
bract or spathe; B,
flower-stalk without
spathe.

Arundel, an ancient municipal borough (till 1867 also parliamentary) of Sussex, on the navigable Arun, 5 miles from its mouth, and 10 miles E. of Chichester. Arundel Castle, the seat of the Fitzalans, Earls of Arundel, from 1243 to 1580, and since then of the Howards (q.v.), comprises a circular Norman keep, 100 feet high, and a modern Gothic edifice dating from 1791. It has stood three great sieges, in 1102, in 1139, and in 1644. The cruciform parish church (1387) has its choir cut off from the nave by a brick wall. The Duke of Norfolk's proprietary claims over this choir, called the Fitzalan chapel, but really a collegiate church, were vainly contested in 1879-80. The splendid Roman Catholic church (1873) was erected by the Duke of Norfolk at a cost of £150,000. Pop. (1851) 2748; (1881) 2748. See *Tierny's Arundel* (1834), and *Freeman's English Towns* (1883).

Arundel, THOMAS, Archbishop of Canterbury, was born in 1353, the second son of Robert Fitzalan, Earl of Arundel. In his twenty-first year he was raised from the archdeaconry of Taunton to the see of Ely; in 1388 he was translated to the archbishopric of York, and in 1396 to that of Canterbury. Banished by Richard II. (1397), he helped to seat Henry of Lancaster on the throne (1399); but he is chiefly remembered as a bitter opponent of the Lollards, two of whom were burned by him in 1401 and 1410. He died 19th February 1413.

Arundel Marbles, part of a collection of ancient sculptures, purchased in 1624 at Smyrna and elsewhere by Thomas Howard, Earl of Arundel (1586-1646), and presented in 1667 to the university of Oxford by his grandson, Henry Howard, afterwards Duke of Norfolk. Its gem is the 'Parian Chronicle,' consisting of fragments of a marble inscription, supposed to have been executed in the island of Paros about 263 B.C. In its perfect state this inscription contained a chronological table of the principal events in Grecian history from 1582 to 264 B.C. The chronicle of the last ninety years is lost, and the extant portion of the inscription is much corroded and defaced. The 'Arundel Society,' established in 1848, for promoting the knowledge of art, commemorates the name of the Earl of Arundel, one of the earliest lovers of art in England.

Arundo. See REED.

Aruwimi is the name of an important tributary of the Congo, entering the latter from the north in 1° 10' N. lat., 23° 30' E. long. It was explored for 100 miles by Stanley in 1883, and by it Stanley advanced to the relief of Emin Pasha in 1887. For a time it was maintained by some that the Aruwimi was the lower course of Schweinfurth's Welle, now believed to enter the Congo by the Mobangi far to the west. See CONGO, AFRICA.

Arvad (Gr. *Arados*), an ancient city of Phœnicia, occupying a small island barely a mile in circumference, 2 miles from the coast, near the mouth of the river Eleutherus. It is said to have been founded by the Sidonians, and was famed for the seafaring skill of its inhabitants.

Arval Brethren (*Fratres Arvales*), a college of twelve priests in ancient Rome, who yearly made offerings to the field Lares for the increase of the fruits of the field. Its institution was ascribed to Romulus, from which we may at least argue its extreme antiquity. Niebuhr suggested that it was originally connected with the Latin element of the Roman state, just as its sister college, that of the *Sodales Titii*, was confessedly instituted for the purpose of keeping up the specially Sabine religious rites. The office was held for life—its badge was a chaplet of ears of corn worn on the head with a white band. One account of the ceremonies at

their principal festival, that of three days in honour of Dea Dia, supposed to be Ceres, is preserved in an inscription written in the first year of the Emperor Elagabalus (218 A.D.). The same inscription contains a hymn, which appears to have been sung at the festival from the earliest times. Later inscriptions show that the college was still in existence about the middle of the fourth century.

Arve, a mountain stream rising in the Col de Balme, one of the Savoyan Alps, and flowing through the Vale of Chamouni into the canton of Geneva, below which town it joins the Rhone, after a course of 62 miles.

Arveyron, a small tributary of the Arve, in Savoy, is the outlet of the famous *Mer de Glace*, in the valley of Chamouni, from which it issues in a torrent through a beautiful grotto of ice, from 40 to 150 feet in height, known as the 'Ice-gates of the Arveyron.' Its course is short, and it joins the Arve on its right bank, some distance above Chamouni.

Arvicola. See VOLE.

Aryan Race and Languages. The name Aryan (less properly, Arian) has, since about 1845, been used to designate the ethnological division of mankind otherwise called Indo-European or Indo-Germanic. That division consists of two branches, geographically separated, an eastern and a western. The western branch comprehends the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, the Basques of the Pyrenees, and the Finns of Lapland; the eastern comprehends the inhabitants of Armenia, of Persia, of Afghanistan, and of Northern Hindustan. The evidence on which a family relation has been established among these nations is that of language. Between Sanskrit (the mother of the modern Hindu dialects of Hindustan), Zend (the language of the ancient Persians), Greek (which is yet the language of Greece), Latin (the language of the Romans, and the mother of the modern Romanic languages—i.e. Italian, French, Spanish, Portuguese, Roumanian), Celtic (once the language of great part of Europe, now confined to Wales and parts of France, Ireland, and Scotland), Gothic (which may be taken as the ancient type of the Teutonic or Germanic languages—including English—and of the Scandinavian), and Slavonic (spoken in a variety of dialects all over European Russia and a great part of Austria), the researches of philology have within the 19th century established such affinities as can be accounted for only by supposing that the nations who originally spoke them had a common origin. No one of these nations, existing or historical, can claim to be the parent nation of which the others were colonies. The relation among the languages mentioned is that of sisters—daughters of one mother, which perished, as it were, in giving them birth. No monuments of this mother-language have been preserved, nor have we any history or even tradition of the nation that spoke it. That such a people existed and spoke such a tongue is an inference of comparative philology, the process of reasoning being analogous to that followed in the kindred science of geology. The geologist, interpreting the inscriptions written by the finger of Nature herself upon the rock-tablets of the earth's strata, carries us back myriads of ages before man appeared on the scene at all, and enables us to be present, as it were, at creation itself, and see one formation laid above another, and one plant or animal succeed another. Now languages are to the ethnologist what strata are in geology; dead languages have been well called his fossils and petrifications. By skilful interpretation of their indications, aided by the light of all other avail-

able monuments, he is able to spell out, with more or less probability, the ethnical records of the past, and thus obtain a glimpse here and there into the gray cloud that rests over the dawn of the ages.

When these linguistic monuments are consulted as to the primitive seat of the Aryan nations, they point to Central Asia, somewhere probably east of the Caspian, and north of the Hindu Kush and Paropamisian Mountains. There, at a period long anterior to all European history—while Europe was perhaps only a jungle, or, if inhabited at all, inhabited by tribes akin to the Finns, or perhaps to the American Indians—dwelt that mother-nation of which we have spoken. From this centre, in obedience to a law of movement which has continued to act through all history, successive migrations took place towards the north-west. The first swarm formed the Celts, who seem at one time to have occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic peoples. All these would seem to have made their way to their new settlements through Persia and Asia Minor, crossing into Europe by the Hellespont, and partly, perhaps, between the Caspian and the Black Sea. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a period subsequent to the last north-western migration, the remnant of the primitive stock would seem to have broken up; part poured southwards through the passes of the Himalaya and Hindu Kush into the Punjab, and became the dominant race in the valley of the Ganges; while the rest settled in Persia, and became the Medes and Persians of history.

It is from these eastern members that the whole family takes its name. In the most ancient Sanskrit writings (the Veda), the Hindus style themselves Aryas; and the name may be preserved in the classic Arii, a tribe of ancient Persia, and in the district Ariana. Airyana is evidently an old Persian word, preserved in the modern native name of Persia, Airan or Iran. *Arya*, in Sanskrit, signifies 'excellent,' 'honourable,' originally, 'lord of the soil,' from a root *ar* (Lat. *arare*, 'to plough'), distinguishing tillers (*earers*) of the earth from the nomadic Turanians. French savans limit the word *Aryan* to the eastern section of the Indo-European stock.

Max Müller has drawn a picture of the Aryan family while yet one and undivided, in which the state of thought, language, religion, and civilisation is exhibited in a multitude of details. Where the same name for an object or notion is found used by the widely spread members of the family, it is justly inferred that that object or notion must have been familiar to them while yet resident together in the paternal home. It is in this way established, that among the primitive Aryans not only were the natural and primary family relations of father, mother, son, daughter, hallowed, but even the more conventional affinities of father-in-law, mother-in-law, sister-in-law; that to the organised family life there was superadded a state organisation with rulers or kings; that the ox and the cow constituted the chief riches and means of subsistence; and that houses and towns were built.

One general observation made by Max Müller is so interesting that we quote it entire. 'It should be observed,' he says, 'that most of the terms connected with chase and warfare differ in each of the Aryan dialects, while words connected with more peaceful occupations belong generally to the common heirloom of the Aryan language. The proper appreciation of this fact in its general bearing will show how a similar remark made by Niebuhr, with regard to Greek and Latin, requires a very different explanation

from that which that great scholar, from his more restricted point of view, was able to give it. It will show that all the Aryan nations had led a long life of peace before they separated, and that their language acquired individuality and nationality as each colony started in search of new homes—new generations forming new terms connected with the warlike and adventurous life of their onward migrations. Hence it is that not only Greek and Latin, but all Aryan languages, have their peaceful words in common; and hence it is that they all differ so strangely in their warlike expressions. Thus the domestic animals are generally known by the same name in England and in India, while the wild beasts have different names, even in Greek and Latin.'

In this mainly pastoral life, the more important of the primitive arts were known and exercised: fields were tilled; grain was raised and ground into meal; food was cooked and baked; cloth was woven and sewed into garments; and the use of the metals, even of iron, was known. The numbers as far as a hundred had been named, the decimal principle being followed. The name for a thousand had not come into requisition until after the dispersion, for it differs in the different Aryan tongues.

The Aryan religion consisted in a worship of natural objects and phenomena, more especially of the sun and dawn, and other bright powers of day; but it was *henotheistic* rather than polytheistic, as out of the many gods he believed in, the worshipper prayed to one only at a time. The gods ruled the world, dwelling like a human family with the *dyauspitar* (*Diespiter*) at their head. This 'father of heaven' was the 'bright' sun, the stars and moon were his sons and daughters. Fragments of the hymns addressed to the gods, framed while abstract language did not yet exist, and every word was a metaphor, originated those stories of gods, heroes, and monsters, which, with more or less of variety, but still with a family likeness, formed the primitive mythology of every member of the group. Curious parallels, however, between Aryan mythology and that of savage races not ethnologically connected with the Aryan have been pointed out by Lang and others, and have given rise to discussion whether these are due to transmission, or merely to the essential identity in the working of the human mind at equal levels of culture.

It should be mentioned that Latham's theory of the European origin of the Aryans was supported by Spiegel and Benfey, and still finds assertors. See Poesche, *Die Arier* (1878); Penka, *Origines Arianæ* (1883); *Herkunft der Arier* (1886); and O. Schrader, *Sprachvergleichung und Urgeschichte* (1883). Some of the European languages would in that case offer a truer representation of the original Aryan tongue than the Indic ones. The original home of the Aryan would be Scandinavia, or the neighbourhood of the Baltic; and the Aryan himself, a coarse nomad, without metals, clothed in skins. Poesche assumes that the Aryan languages were the product of the white race, whose colour was due to the albinism caused by a long residence in the marshy country between the Niemen and the Dnieper. But as Sayce points out, the weight of evidence from comparative philology is against other than an Asiatic cradle for the Aryan tongue. The parent-speech need not necessarily have been one undivided uniform tongue, but may already have been split up into dialects, like the provincial Latin that developed into the Romanic languages of modern Europe. Humboldt believed that the Sea of Aral is the remains of a great inland lake which once included the Caspian and the Euxine—a theory confirmed by recent researches. According to Sayce, it was this

inland sea, with the desert that lay to the south of it, which cut the Aryans off from communication with the civilised races of Elam and Babylonia, and forced the first emigrants to the west to push their way through the steppes of Tartary and the pass of the Ural range.

See Sayce's *Introduction to the Science of Language* (2d ed. 2 vols. 1883); also the articles ETHNOLOGY, PHILOLOGY, MYTHOLOGY.

As was the designation both of a Roman weight (called also *libra*) corresponding very nearly to an English *pound*, and also of a coin made of the mixed metal *aes*, or bronze. The weight was divided into 12 parts; the *uncia* = $\frac{1}{12}$, the *quadrans* = $\frac{1}{4}$, the *sextans* = $\frac{1}{6}$ as, &c. The as (coin) originally no doubt weighed a (Roman) pound, of the value of about 84d., and was uncoined until Servius Tullius stamped it with the figures of animals, hence the Latin *pecunia*, 'money,' from *pecus*, 'cattle.' Pliny tells us that in the first Punic war,

As.

on account of the scarcity of money, the as was reduced to two ounces, a sixth of its ancient weight, and that thus the republic paid off its debts, gaining five parts in six; that afterwards, in the second Punic war, during the dictatorship of Q. Fabius Maximus, it was again reduced one-half, to one ounce, and the *denarius* was decreed equal to sixteen *ases*, the republic thus gaining one-half; and that soon after, by the Papirian law (191 B.C.), *ases* of half an ounce were made. When the *denarius* was equal to ten *ases*, the value of the as was a little more than three-farthings; when sixteen *ases* went to the *denarius*, its value was about a halfpenny. It was by the silver coin, the *Sestertius* (q.v.), that money was reckoned at Rome. It was originally equivalent to $2\frac{1}{2}$ *ases*, or one-fourth of a *denarius*.

Asa, son of Abijah, and third king of Judah (956-916 B.C.), strove zealously for the purity of religion, and to strengthen the defences of his kingdom. He repelled with immense slaughter an Egyptian invasion, and waged successful war against Baasha, king of Israel, with the aid of the Syrian monarch, Benhadad.

Asa Dulcis (i.e. Sweet Asa), a synonym of Benzoin (q.v.). This name was applied to the gum-resin when it began to be imported into Europe in the early part of the 16th century.

Asafœ'tida, or ASSAFŒTIDA (i.e. Fetid Asa or Assa), is a gum-resin, which has been supposed to be identical with the exuded juice of the *Silphion* of Dioscorides, so highly esteemed among the Greek physicians. Its name is derived from the Persian word *azā*, 'mastic.' The drug is procured by drying the milky juice which flows from the root of the plant *Ferula* (*Narthex*) *asafetida*. The root of the asafœtida plant is long, and generally undivided; white inside, but having a black covering; and contains in its interior a quantity of juice of an overpowering odour, which much resembles that of garlic. *Ferula* or *Narthex asafetida* has its radical leaves tripartite, their segments bipinnatifid, and nearly two feet in length.

Asafœtida is prepared in the dry southern provinces of Persia, but chiefly in Khorassan and

Afghanistan, and also to the north of the Hindu Kush range of mountains. About April, the root-leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks, a slice is cut horizontally from its summit, this operation being repeated at intervals of a few days till the root is exhausted, and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly shaped tears, agglutinated together by a softer substance. Asafœtida is used in medicine, and possesses stimulant and anti-spasmodic properties. When taken internally, it undergoes absorption, and may be detected in almost every secretion of the body, as the saliva, breath, and urine. According to the analysis of Pelletier, asafœtida is composed of the following substances: resin, 65 parts; volatile oil, 3.6; gum, 19.44; bassorin, 11.66; various salts, .30. In many parts of the East, this drug is used as a condiment, in which respect it seems to take the place of the garlic of some European nations.

*Ferula asafetida*.

Asaphus. See TRILOBITE.

Åsar is the Swedish name given to long winding banks and ridges of gravel and sand, which occur abundantly in the low grounds of Sweden. They often run continuously for more than 100 miles—sometimes one dominant ridge being joined by many tributary ridges, just as a river by its affluents. They are believed to have been formed underneath the great *mer de glace* which covered Sweden during the Glacial Period (q.v.), and to mark the site of sub-glacial streams and rivers. Similar gravelly ridges occur in Ireland, where they are called *esker*, and in Scotland, where they are called *kames*—a name which has been applied to similar gravelly accumulations which occur over vast regions in the northern states of the American union.

Asarabac'ca

(*Asarum europæum*), a plant of the natural order Aristolochiaceæ (see ARISTOLOCHIA), a native of Europe, growing in woods; but rare in Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic, and were formerly considerably used in medicine, especially in the preparation of snuffs used in the treatment of catarrh, &c.—A nearly allied species, *A. canadense*, a native of Canada, is stimulant and

*Asarabacca*
(*Asarum europæum*).

diaphoretic, and is used, under the name of Canada Snakeroot, instead of *Aristolochia serpentaria*. It is also called Wild Ginger, and used as a spice, being of a warm aromatic quality, and not acrid, like its European congener.

Asben. See AIR.

Asbes'tos, a mineral very closely allied to tremolite, actinolite, and hornblende, and which, along with tremolite and actinolite, is often ranked among the varieties of hornblende. It consists chiefly of silica, magnesia, lime, and oxide of iron, and is of a fine fibrous character, the fibres sometimes combined together in a compact mass, sometimes easily separable, elastic and flexible. It is generally of a whitish or greenish colour, and has a silky or vitreous lustre. The variety called *Rock-cork* very much resembles cork, is soft and easily cut, and so light as to swim in water. *Rock-leather* and *Rock-wood* are varieties somewhat similar to rock-cork, but not so light. The finest fibrous variety with easily separable fibres is called *Amianthus* (from a Greek word signifying 'unpolluted,' as Asbestos is from a Greek word signifying 'indestructible'), because cloth made of it was cleansed by passing it through fire. This cloth was used by the ancients to enwrap dead bodies placed on the funeral pile, so as to preserve the ashes of the body unmingled. The finest amianthus is found in the Tarentaise in Savoy. It is abundant in Corsica, and is found also in Cornwall, at Portocly in Scotland, and in several of the Shetland Islands. The main supply came, till of late, from the older crystalline rocks of the Alps and Pyrenees, from North America and Silesia, but is now obtained mostly from Italy and Canada, Tasmania, and New South Wales. Asbestos is now applied to many and very various purposes. It is largely employed in the form of cloth or canvas as a filtering medium for corrosive liquids, while as millboard or cardboard it has an extensive application in the form of washers for fire or acid proof joints. Steam stopcocks are now constructed in which the key or plug works in a chamber closely packed with fibrous asbestos; while for all kinds of engine joints, boiler man-holes, and similar situations, the imperishable nature of asbestos renders it specially valuable. It has recently come into extensive use in the construction of gas fires. At first the coarser varieties only were used, being ground to powder, and then made into balls of a reddish-brown colour by means of fireclay. These being heated by some form of Bunsen-burner (q.v.), became red-hot, and radiated out a large proportion of heat. Later inventors, however, tend to use the filamentous white variety, in combination with a network of iron, for the purpose of producing a more cheery fire, the thin fibres being readily raised to a white heat. In the form of paint (made with asbestos powder, the medium being a secret) it has been much used to render wooden buildings more or less fully fireproof; but the tendency of the paint to peel off the wood has hitherto detracted from its value. Wood treated in this way does not burst into flame, but only smoulders away under the influence of heat. As a non-conductor of heat, asbestos has valuable properties; a sheet of it placed on a table enabling red-hot vessels to be put down without danger. It is used for so many and various purposes as packing for all classes of machinery, fire-escapes, firemen's clothing, furnacemen's gloves, fireproof putty, sheeting, boiler and steampipe covering, millboard for every purpose, paper, cloth for filtering acids and other similar uses; for covering rollers in print-works (where aniline dyes are employed, and it is necessary to resist heat and the action of the acids); for

flooring-felt, roofing-felt, and wall-felt, more especially in timber-built houses; as a lubricant for every kind of engine; for portable fireproof safes, and for lamp-shades; for curtains in theatres; as a non-conductor in electrical work, as tubing for covering telegraph wires, and for electricians' gloves. Asbestos paper, printed with a pattern, has been used to cover wooden partitions. In its manufacture the lumps of crude asbestos are put through an ingenious crushing-machine, whose rollers have a parallel motion in addition to their rolling action over each other. This action effectually opens out the fibres, which are then boiled in large tanks. The shorter fibres having been ground down and reduced to a pulp, are converted into asbestos millboard by manipulation on gauze netting. The longer fibres on leaving the crushing-machine are woven into yarn and cloth in looms.

Asbjörnsen, PETER CHRISTIAN, one of the most popular among Norwegian authors, was born 15th January 1812 at Christiania. He studied at the university in his native city, then found in the leisure of a four years' residence as a tutor in the country the opportunity to learn thoroughly the life of the common people. In long journeys on foot he collected a rich store of popular poetry and folklore. On his return to the capital he devoted himself to the study of medicine and the natural sciences, and from 1846 to 1853 he explored and dredged, at government expense, various parts of the Norwegian coast, without neglecting the while any opportunity of prosecuting his favourite study. In the years 1849-50 he accompanied a Norwegian ship of war to the Mediterranean, and from 1856 to 1858 he studied forestry at Tharandt in Saxony. Appointed inspector of forests for the Trondhjem district in 1860, he was sent by government in 1864 to investigate the manufacture of peat in Holland, Germany, and Denmark. On his return he was appointed to take measures for its better manufacture among the peasantry, and he resigned this office only in 1876. He died at Christiania, 6th January 1885. Asbjörnsen lived a busy and useful life, and wrote many scientific and practical books on such subjects as natural history, forestry, peat-manufacture, marine fauna, and sensible cookery; but it is not by these, but by his inimitable collections of folk-tales, that his name will be remembered. He first opened the eyes of his countrymen to the rich treasures of poetry and quaint folklore that were to be found among simple and honest country-people; and it is hardly too much to say that to his collections is directly due the growth of the national element in Norwegian literature which has since become predominant in the literature, art, and music of the country. He was fortunate in finding for his first collection a coadjutor with almost as fine poetic sympathy as himself, Jorgen Moe, afterwards Bishop of Christiansand, and one of the most considerable poets of his time. The two friends published in 1842 the first series of *Norske Folkeeventyr* ('Norwegian Folk and Fairy Tales'), in the vernacular of the country. Asbjörnsen alone published in 1845 the first series of his *Norske Huldreeventyr og Folkesagn*, consisting of stories about the *Hulde*, or fairy of the Norwegian woods, with bright descriptions of the natural scenery and of the characteristic life of the peasantry. Three years later (1848) appeared a second collection; and in 1871 he published also a second volume of the *Folkeeventyr*. These books are now classics in their native literature, and have a place on the shelves of folklorists in all countries. They have been translated into most European languages; into English by Sir George W. Dasent in *Popular Tales from the Norse* (1859), and *Tales from the*

Fjeld (1874); and by H. L. Brækstad in *Round the Yule Log* (1881).

Asbury, FRANCIS, the first Methodist bishop consecrated in America, was born at Handsworth in Staffordshire, August 20, 1745. When sixteen years old he became an itinerant Wesleyan preacher, and in 1771 he was sent as a missionary to America, where he was consecrated in 1784. During a long life of almost incessant labour, it is estimated by his biographer that he travelled about 270,000 miles (mostly on horseback), preached about 16,500 sermons, and ordained more than 4000 preachers. Of great natural ability and indomitable energy, he ranks with Wesley, Whitefield, and Coke in the Methodist movement of his time. He died at Richmond, Virginia, March 31, 1816.

As'calon, or ASHKELON, one of the five chief cities of the ancient Philistines, lying north of Gaza, on the Mediterranean. It was strongly fortified, had a shrine of the Syrian fish-goddess Derketo, and was the birthplace of Herod the Great. In Solomon's time it was tributary to the Jews; later it became independent, and its kings often kindled the wrath of the prophets. Under the Romans it was a kind of republic, and afterwards the seat of a Christian bishop. The Arabs took it in 637. Before its walls in 1099 the Crusaders, under Godfrey de Bouillon, gained a decisive victory. Recaptured by the Moslems, it was retaken, after a five months' siege, in 1157, by Baldwin III. It was dismantled by Saladin in 1191, and completely demolished in 1270 by Sultan Bibars. The name of this ancient city is preserved in the *Eschalot* or *Shallot*, a favourite kind of onion, first grown in the fertile plains around.

As'caris, a genus of parasitic worms in the Nematode or Thread-worm (q.v.) order. *Ascaris lumbricoides* is one of the four thread-worms not infrequently infesting man, and especially children. It occurs in the intestine, whence it occasionally works its way into other parts of the body. The thin cylindrical body measures from 6 to 10 inches in length, is of a whitish or light-yellow colour, and is pointed at both ends. The surface of the transparent skin is somewhat wrinkled, but there are no internal segments. The sexes are separate, and the less frequent males are distinguished by their turned-up posterior

A, posterior end of female;
B, posterior end of male.

extremity, and the presence of two copulatory spicules. The skin is strong and protective, and forms three lips round the mouth. The muscular system is well developed, and the name *Ascaris* (Gr. *askarizo*, 'to jump') probably refers to the lively motions of some forms. The eggs develop in water or damp earth, and it seems probable that the embryos are directly swallowed by man. This troublesome though rarely dangerous parasite is best dealt with by means of expulsive purgatives. Care as to the purity of drinking-water, and thorough cleaning of vegetables eaten raw, are evident preventive precautions. See PARASITISM, ROUND-WORMS, THREAD-WORMS.

Ascension, a solitary island nearly in the middle of the South Atlantic, 685 miles NW. of St Helena, in 7° 57' S. lat., and 14° 21' W. long. It is said to have received its name from having been discovered by a Portuguese navigator on Ascension-day, 1501. It is 7½ miles long by 6 broad, its area being 35 sq. m. First occupied by the English in 1815, in connection

with Napoleon's detention on St Helena, it is now used only as a sanatorium, having ceased since 1887 to be a coaling depôt. Like St Helena, it is of volcanic origin, being one of the peaks of a submarine ridge which separates the north and south basins of the Atlantic. It rises in the Green Mountain to a height of 2870 feet. The water-supply is drawn from this mountain at a great height above sea-level. The climate is dry and healthy. Vigorous attempts have been made in recent years to bring the land under cultivation. Young trees, shrubs, furze, grasses, and hardy plants have been planted with success; and now the grasses fatten a large number of sheep and cattle. European vegetables are grown, besides the indigenous tomato, castor-oil plant, and pepper. Thus this barren rock has been made capable of supporting a considerable population. Turtles are very abundant. Several astronomers and savans have visited Ascension, from Halley in 1677, to Darwin, Sir Wyville Thomson, and Mr Gill in the 19th century. Pop. (1871) 27; (1886) about 500, chiefly officers, seamen, marines, and Kroomen. See Mrs Gill's *Six Months in Ascension* (1879).

Ascension, RIGHT, the name given in astronomy to one of the arcs which determine the position relatively to the equator of a heavenly body on the celestial sphere, the other being the declination (see ARMILLARY SPHERE). It meant originally the difference of time of rising of the first point of Aries (q.v.) and the heavenly body referred to, on a right sphere. Hence it is called *Right Ascension*. The sphere of the heavens would be *right* if the poles were on the horizon, as is the case at the earth's equator. At all other places, the axis of the celestial sphere is *oblique*—i.e. inclined to the horizon—so that the right ascension of a star gives no *direct* knowledge of its rising time except there. The term *right ascension* has thus passed into general use as meaning simply the arc of the equator intercepted between the first point of Aries, and the point at which the circle of declination passing through the star cuts the equator. Measured always from west to east, right ascension on the heavens corresponds to longitude on the earth. The right ascension of a heavenly body is ascertained by means of the transit instrument and clock. The transit instrument determines its meridian passage, and the transit clock gives the time at which this takes place. When the first point of Aries is in the meridian, the clock stands at 0 hours, 0 minutes, 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock, therefore, at the passage of any heavenly body gives its right ascension in time, and this, when multiplied by 15, gives the same in degrees, minutes, and seconds. The right ascension is usually given, however, in time. The old term, *oblique ascension*, was given to the right ascension of the point of the equator that rose simultaneously with the heavenly body; and the difference of the oblique and right ascension was called the 'ascensional difference'.

Ascension-day, or HOLY THURSDAY, one of the great festivals of the church, held on the fortieth day after Easter, to commemorate the ascension of Christ into heaven. Its institution dates from the 4th century. The Church of England appoints special psalms for it, and particularly recommends it as a fitting day for the receiving of the communion. Connected with the religious observances of the day were certain civic ones, which in some parts of England and Scotland are continued to this day—viz. *beating the bounds*, or *riding the marches*, though their

religious connection is apparently forgotten. See **ROGATION DAYS**, and **BOUNDS (BEATING THE)**.

Asceticism. Among the Greeks, *askēsis* denoted the training gone through by athletes or wrestlers, who had to harden their bodies by exertion and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions; and in this sense it passed into the language of the early Christians. But to understand the vast influence that ascetic ideas have exercised on the Christian religion, we must look beyond the bounds of its history. Their root lies in the oriental notion of the antagonism between mind and matter. The glowing imagination of the oriental carries the practice of asceticism to a monstrous extravagance, as is seen in the frightful self-tortures inflicted by the yogins (see **YOGA**) and fakirs (see **FAKIR**), the suicides in the sacred Ganges and otherwise, and the practices formerly prevalent of offering children in sacrifice, and of burning widows (see **SUTTEE**). Buddhism, which may be considered as a kind of Puritan reformation of the Indian religion, carried the principle beyond its previous bounds. In its contemning the world, in its inculcating a life of solitude and beggary, mortification of the body, and abstinence from all uncleanness and from all exciting drinks, the object was to keep as distant and detached as possible from this 'Vale of Sorrow' (see **BUDDHISM**, and **NIRVANA**). The ancient Egyptians sought to confine it to monogamy of the priests, rigid purity, moderate flagellation, and frequent contemplation of death.

It is in this light that we must consider Jewish and Christian asceticism. In the oriental mind, especially in Egypt, circumcision, avoiding of all uncleanness, and fasting, were signs of humiliation before God. Among the Jews, voluntary vows of abstinence, even from lawful food or wine, were practised by prophets and men of special calling, and in certain critical circumstances; but self-castigation continued for long foreign to the sobriety of Judaism, and even hermitism came into established practice only shortly before Christ, in Palestine among the Essenes (q.v.), in Egypt among the Therapeutæ (q.v.).

Asceticism was far less congenial to the reflective nations of the West, above all to the cheerful Greeks. A Greek felt himself as well entitled to enjoyment as his gods; hence Greek religious festivals were pervaded by cheerfulness. The only exception appears to be the Eleusinian mysteries, which never took hold of the people generally, and the passing phenomenon of the Pythagorean fraternity. The attack made by the Socratic school upon the body as the prison of the soul, and the extravagant contempt for the elegances, and even decencies of life, professed by the later Stoics and Cynics, were no genuine fruits of the popular Greek mind; and we must also ascribe to the infusion of oriental philosophy the ascetic tendencies of Neoplatonism, in holding abstinence from flesh and from marriage as chief conditions of absorption into the divinity.

It was into the midst of these ideas that Christianity was introduced. The Jewish converts brought with them their convictions about fasting. Fasting and Nazaritic observances were thought sanctifying preparatives for great undertakings; and the inculcation of abstinence from marriage, on the ground of the expected speedy reappearance of Christ, falls in with the same notion—namely, that the flesh, i.e. the sensual part of our nature, is the seat of sin, and must therefore, before all things, be rigorously chastened. The spirituality of Christianity, pointing away from

earth to heaven, and opposition to the corruption of the heathen world, combined to make the Christians of the 2d and 3d centuries hold aloof from the world and its wisdom, and favour abstinence from marriage, more especially on the part of the clergy. This ascetic spirit began as early as the commencement of the 2d century to court trial in the perilous practice of men and women living together under vows of continence. But during the first three centuries no irrevocable vows yet bound the devotees to a life-long asceticism. Fasting was also comparatively rare.

But the tendency to outward manifestations now began to grow stronger. The inward and spiritual life of the Christians had greatly declined; and if the previous bloody persecutions had driven individuals from human society into the deserts, the growing secularisation of the church, after Christianity became the state religion, had the same effect to a still greater degree. All this paved the way for the chief manifestation of asceticism—namely, monasticism, which the church found herself compelled by the overwhelming tide of opinion within and without to recognise, and to take under her protection and care. From the African Church, represented by Tertullian and Augustine, a spirit of gloomy and crushing supernaturalism spread deeper and deeper over the Western Church generally, intensifying the ascetic tendencies, and leading to still more marked separation from a despised world. There were not wanting healthier minds—as Jovianus and Vigilantius—to raise their voices against fasting and the outward works of asceticism generally; but such protests were vain, and became ever rarer.

From the 11th century, the Cathari, Waldenses, and other sects, though ascetics themselves in a way, yet assailed the external asceticism of the church; and so did Wyclif, Huss, and Jerome of Prague, in their premature struggles at reformation. After a preliminary skirmish by Erasmus, the struggle was decided for a great part of Christendom in the reformation of the 16th century; though the Catholic Church and a section of the Anglican Church still set a high value on various ascetic conditions and exercises—a celibate clergy, the monastic life, fasting and penance. Even the disuse of some of the simple comforts of life, such as the disregard of personal cleanliness, has been regarded as a work of holiness. The fundamental principle that salvation is secured by justification through faith, and not through dead works, struck at the root of monasticism and self-mortification in general. Yet the ascetic spirit often shows itself still alive under various disguises even in Protestantism. The extreme forms of Sabbatarianism have a distinctly ascetic colouring; and hostility to dancing, the theatre, card-playing, and other worldly pleasures (if these are not actually regarded as sinful), may be the outcome of ascetic tendencies. The Mennonites inculcated a rigid asceticism; and with the Shakers (q.v.) of America celibacy is insisted on as a virtue. The essence of asceticism is to hold self-denial and suffering to be meritorious in the sight of God, in and for itself. Many traits presented by Puritanism, Methodism, and Quakerism appear ascetic. It is not impossible that vegetarianism, total abstinence, and other recent austerities, though advocated on other grounds, recommend themselves to the feelings of many from their falling in with this deep-seated propensity to asceticism.

Even in the Catholic Church, ascetic practices have been modified in recent times; fastings are less rigorous, and the self-sacrifice of conventual life is more directed to beneficial ends. Mohammedanism (q.v.) has undergone the same change, but Sufism (q.v.) is carried to the greatest excess

in Persia. In the Greek Church, monasticism had always a milder form. See the articles CELIBACY, FASTING, HERMIT, LENT, MONASTICISM, PENANCE, PILGRIMAGE, PILLAR SAINTS.

Asch, a town of Bohemia, 14 miles NW. of Eger. It has thriving silk, cotton, and woollen manufactures, especially of stockings. Pop. (1880) 13,209, chiefly Protestants.

Aschaffenburg, a Bavarian town of Lower Franconia, on the right bank of the Main, at the Aschaff's influx, 25 miles SE. of Frankfort. The castle of Johannisburg, a Renaissance pile of 1605-14, overlooks the whole town. The Romanesque Stiftskirche was restored in 1870-81, and there is a reproduction of a Pompeian villa, built for Louis I. in 1842-49. Paper is the staple manufacture. Pop. (1885) 12,611, principally Catholics. The Romans built a fortress at Aschaffenburg; and here in 976 Otto I., Duke of Swabia and Bavaria, founded the collegiate church (*Stiftskirche*), which after his death came into the possession of the Archbishops of Mainz, and remained with them until the dissolution of the Germanic empire. In 1814, along with the principality of which it was the capital, Aschaffenburg was ceded to Bavaria by Austria. Near it the Prussians defeated the Austrians, July 14, 1866.

Ascham, ROGER, a distinguished English writer and classical scholar, was born in 1515 at Kirby Wiske, near Thirsk, in Yorkshire. He received his early education in the family of Sir Anthony Wingfield, and by him was sent, in 1530, to St John's College, Cambridge, where, in 1534, he took his B.A., and, in spite of his avowed leaning to the Reformed doctrines, obtained a fellowship. The study of the classics, especially Greek, had recently been revived at Cambridge, and Ascham's bent impelled him with ardour to these studies. His reputation as a classical scholar soon brought him numerous pupils; and about 1538 he was appointed Greek reader at St John's. He at first opposed the then new method of pronunciation which is still used in England; but afterwards adopted and defended it. His leisure hours were devoted to music, penmanship (in which he excelled), and archery. In defence of the latter art, he published, in 1545, a treatise entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among English classics. For this treatise, which was dedicated to Henry VIII., he was rewarded with a pension of £10, equivalent to about £100 of our present money. In 1546 he was appointed university orator. In 1548, on the death of his former pupil, Grindal, he was called to supply his place at Cheshunt as tutor to the Lady Elizabeth. In this office he gave the highest satisfaction; but at the end of two years abruptly resigned it, on account of a quarrel with the princess's steward. As secretary to Sir Richard Morysin, ambassador to the court of Charles V., he spent three years (1550-53) on the Continent, at Augsburg chiefly, but with occasional visits to Venice, the Tyrol, Carinthia; and in 1553 was published his *Report on the Affairs of Germany*. During his absence, he had been appointed Latin secretary to Edward VI.; and on his return, after the young king's death, the interest of Bishop Gardiner secured him the same office under Mary, his pension being at the same time doubled. His prudence and moderation preserved him from offending by his Protestantism; and after Mary's death, Elizabeth retained him at court in the double capacity of secretary and tutor, which offices he held till his death, 30th December 1568. His principal work, *The Scholemaster*, a treatise on classical education, was published in 1570 by his widow, and has been well edited by

Professor Mayor (1863). His admirable Latin and English letters, 295 in number, are included in Dr Giles's excellent edition of his English works (3 vols. 1864-65). See also Dr Katterfeld's *Roger Ascham, sein Leben und seine Werke* (1879).

Aschersleben, a town of Prussian Saxony, on the river Eine, 32 miles SW. of Magdeburg. Pop. (1871) 16,734; (1885) 21,528, occupied in agriculture, gardening, and manufactures of woollens, linens, sugar, machinery, and chemicals. In the vicinity are some ruins, falsely identified as the old castle of Ascania, the original seat of the House of Anhalt.

Ascidians, or TUNICATES, are a class of degenerate survivors of ancestral vertebrates. They were observed and well characterised by Aristotle, but were never really understood till 1866, when the discovery of their complete life-history warranted naturalists in removing them from their random position beside molluscs to the base of the vertebrate series. The larvæ exhibit unquestionable vertebrate characters—viz. a spinal cord, brain, and cerebral eye, a notochord (q.v.), gill-slits, ventral heart, &c. Except in Appendicularia, however, the vertebrate characters of the larvæ are to a large extent lost in the usually sessile degenerate adult. The tail shrivels up, the notochord and spinal cord disappear, the brain is represented merely by a small ganglion, and the whole symmetry of the body is altered. The ordinary ascidians, the sea-squirts, so called from their power of jerking out water when touched, are common along the coasts of all seas, ranging from low water to twenty fathoms, and usually attached to stones or shells, while some of the more complex forms are free-swimming. Few of them measure separately more than 3 or 4 inches, and most of them decidedly less, but the more or less intimate colonies frequently formed often attain larger dimensions. Chains of free-swimming ascidians sometimes occur several feet in length.

The following account refers primarily to a simple ascidian, and ought to be prefaced by reading the account of Appendicularia (q.v.), which, as has been noted, retains the larval characters lost in other ascidians. The animal has a double-mouthed flask shape, and is enveloped in a transparent, gelatinous, external sheath, which is secreted by the real skin. This test is remarkable as containing Cellulose (q.v.), the substance which forms the cell-wall of vegetable organisms. Through one of the apertures which are usually fringed with minute lobes, and often bear little coloured spots, the water enters the body; through the other the water, fæces, and reproductive elements are expelled. The anterior region of the alimentary canal forms a large respiratory pharynx, such as also occurs in one worm-like form, *Balanoglossus*, in *Amphioxus* (q.v.), and in all vertebrates in the embryonic stage at least. As in Appendicularia, a pair of involutions from the skin meet outgrowths from the gut, and establish a primitive respiratory communication with the exterior. In

Fig. 1.

Structure of a simple Ascidian, showing inhalant aperture, leading into respiratory pharynx; looped alimentary canal, opening along with genital duct into cloacal chamber; nerve ganglion between inhalant and exhalant apertures; reproductive organs near the base, eggs in body-cavity, &c.; heart at very base; fixing processes. (After Hæckel.)

the ascidian, however, this simple structure is replaced, as afterwards described, by a multitude of gill-slits opening from the pharynx into a surrounding chamber which communicates with the exterior by a single aperture. The water is drawn in by the mouth, passes through the richly ciliated slits of the pharynx, bathes the blood spread out on the walls, enters the surrounding chamber, and finds its way out by the excurrent orifice. By the same orifice the faeces and generative products reach the exterior. The internal ventral surface of the pharynx exhibits a special groove, which bears cilia and secretes slime. By this means the food particles are caught and wafted along to the beginning of the food-canal proper. The groove, which here forms the nutritive region of the pharynx, is distinctly seen in amphioxus and young lampreys, and seems to be represented by the thyroid gland (see THYROID) of higher vertebrates. The oesophagus, beginning at the lower corner of the pharynx, leads into a stomach provided with a digestive gland, and the intestine loops upwards to end in the cloacal chamber. The pharynx is surrounded by a muscular sheath more or less interrupted. To this the squirting powers are of course due. The nervous system of the adult exhibits no trace of spinal cord; but consists simply of a ganglion lying between the two orifices, and giving off a number of nerves. In the larva the brain has in close association with it an embedded eye, a rudimentary ear, and a ciliated protrusion probably olfactory. The heart differs from invertebrate hearts in being a dilatation of a ventral vessel. It gives off vessels to the respiratory pharynx and other regions, and is remarkable for exhibiting an alternating direction of the circulation, as has also been observed in some worms (Gephyrea). The blood is pumped alternately in opposite directions, at intervals (30 to 200 pulsations) varying with the species and even individual. A closed sac near the respiratory pharynx has been found to contain nitrogenous waste products, and probably represents a kidney. The reproductive organs are usually hermaphrodite, and the testis is sometimes in extremely close association with the ovary. They lie far down in the body, and are often destitute of ducts. When these are present they open, as stated, into the excurrent cloacal chamber. The sex products are not usually ripe at the same time, and self-fertilisation is thus prevented. Asexual reproduction by budding is exceedingly common, and spreading colonies are thus formed. It was in one of the ascidians that the poet Chamisso first observed what is known as *Alternation of Generations* (q.v.)—i.e. that one or more asexual forms are interposed between the sexual. This alternation is sometimes very complicated.

The Tunicates, apart from Appendicularia, are conveniently divided into three groups—Simplicia, Composita, and Consorta—(1) simple forms, including the ordinary sea-squirrels, and those which live socially, but without losing their independence; (2) compound forms, where numerous individuals are subordinated in a colony which may be either sedentary or free-swimming; and (3) free-swimming forms in which the sexual generations are united in chains. The first lot may be represented by the common *Ascidia*, *Cynthia*, &c., some of which are eaten; by *Chevreulius*, which has a test with two movable flaps; by the stalked form *Boltenia*; and by the social *Clavellinas*. The Botryllidae are among the commonest types of sedentary compound forms, while the brightly phosphorescent cylindrical *Pyrosoma* is free-swimming. The members of the third group have a very complex structure, and exhibit alternation of generations. They are re-

presented by *Salpa* and *Doliolum*. In *Doliolum* the sexual generation (A) gives rise to an asexual form (B); this develops two kinds of asexual buds (C and D), from one of which the sexual generation (A) is again produced. The development of the ascidians, first observed by Kowalevsky in 1866, has secured their position as vertebrates. Stage for stage it exhibits the closest resemblance to the development of amphioxus. The fertilised ovum divides completely and regularly to form a hollow ball of cells (*blastosphere*). One half of this ball is depressed within the other, and the result of this *invagination* is the two-layered oval embryo known as a *Gastrula*. Along the dorsal side of this embryo an axial groove appears—the medullary groove, which becomes converted into a closed canal by the meeting of its two folds. Thus is formed the neural canal of the spinal cord. In the closure a communication is for a time left

Fig. 2.—Compound Ascidian (after Milne-Edwards):

Rosettes of 6 or 7 united individuals, with separate inhalant, but united exhalant apertures; m, the inhalant aperture; a, the common exhalant aperture. The colonies are attached to a piece of seaweed.

Fig. 3.

4, gastrula; 5, further advanced embryo.

between the cavity of the canal and the original mouth of the gastrula. This communication, connecting nerve canal and primitive gut, is known as the *neurenteric canal*. On the back of the primitive gut, towards the posterior end, a band of cells is formed, the beginning of the notochord, which supports the growing tail, and represents in these lowly vertebrates the incipient 'backbone.' The sides of the primitive gut-cavity form posteriorly the lateral muscles. All this time the embryo has been inclosed within its egg-membrane, but with the growth of the tail, two or three days after fertilisation, the imprisoning case is burst, and there is liberated a free-swimming larva—strikingly like a tadpole. At the end of the closed canal, which may be said roughly to represent the spinal cord, there is a dilatation which may be called the brain. In this some progress soon becomes manifest, especially in the appearance of ear and eye, which remain in closest association with the brain, and are lost in the degenerate adult. The remains of the primitive gut form in various ways the respiratory pharynx, the oesophagus, stomach, and intestine of the adult ascidian.

About the time the larva is hatched, another very

important organ appears. A pair of outgrowths from the front of the gut meet, and fuse with a pair of dorsal involutions from the skin. The result is a paired atrial cavity, virtually open to the exterior by the two apertures of involution, and connected with the gut at the origin of the outgrowths—i.e. by gill-clefts. After a while a second pair of clefts appear, opening into the same atrial cavity. It must be noted at this stage that a secretion from the skin which began before the larva was hatched, has resulted in the formation of an intact 'test,' which clothes the entire larva, and is nowhere perforated. The free tadpole-like larva now fixes itself, first by a papilla and then by its test, as shown in the diagram, and with attachment the spinal cord, notochord, &c. begin to degenerate. An opening in the test appears opposite the mouth,

Fig. 4.—Attachment and degeneration of larval Ascidian (from Lankester):

b, brain; m, mouth; n, notochord; g.s., gill-slits; t, tail.

which thus becomes at length functional. The paired atrial cavities also open by perforations through the test, and dilate internally so as to embrace the whole of the respiratory pharynx. To this their walls become, indeed, attached, and a large number of gill-slits perforate this double wall. The two openings to the exterior coalesce into one, and the two cavities also unite to form a single peribranchial chamber. The anus has been gradually shunted dorsalwards, and opens into the atrial cavity in the region already referred to as the cloaca. The gradual modification of structure is well illustrated in the accompanying figure. The result is in most cases a vivid instance of that degeneration which not infrequently follows from sedentary life. See AMPHIOXUS, APPENDICULARIA, DEGENERATION, VERTEBRATA; also Huxley's *Anatomy of Invertebrates*; Balfour's *Embryology*, vol. ii.; Ray Lankester's *Degeneration* (in the Nature Series).

Asclepiadaceæ (or *Asclepiadeæ*), a chiefly tropical order of corollifloral dicotyledons, closely allied to Apocynaceæ, from which they are chiefly distinguished by the united filaments and coherent stigmas to which the anthers adhere, as well as by the peculiar orchid-like pollen-masses. They are mostly shrubs, often with twining stems, and almost always possess milky juice, which is usually poisonous, sometimes so much so as to be used for arrow-points, but is occasionally bland, and even in the case of the Cow-plant of Ceylon (*Gynema lactifera*) is used as food. It is sometimes also a source of caoutchouc. Some are prized by florists, notably the fragrant Stephanotis, the Wax-plant (*Hoya carnosus*), as well as species of the curious genus Ceropegia, and the cactus-like and carrion-scented Stapelia. A number of species are medicinal, as Indian Sarsaparilla (*Hæmidesmus indicus*); Mudar (*Calotropis gigantea*), so highly prized in the East Indies; *Sarcostemma glaucum*, the Ipecacuanha of Venezuela; *Tylophora asth-*

matica and *Secamone emetica*, the roots of which are used as emetics, and in smaller doses as cathartics, and the former of which is employed as Ipecacuanha in India. *Cynanchum acutum*, which yields a purgative called Montpellier Scammony, and *Vincetoxicum officinale*, which possesses similar properties. Argel (q.v.), much used for adulterating senna, belongs to this order.—The down of the seeds is sometimes employed as a substitute for silk or cotton; and the stems of not a few species afford useful fibres, as those of the *Asclepias syriaca*, the Mudar and other species of *Calotropis*, natives of India and Persia, *Hoya viridiflora*, *Holostemma Rheediamum*, &c. The Mudar or Yercum fibre is highly spoken of, and the bark of *Marsdenia tenacissima*, a small climbing-plant, yields a fibre called *Setee*, of which the Rajmahal mountaineers make bowstrings of remarkable elasticity. The fibre of *M. Roylei* is used in Nepal. *Orthanthera viminea*, which grows at the base of the Himalayas, and has long leafless wand-like stems of 10 feet in height, yields a fibre of remarkable length and tenacity, suited for ropemaking. The fibres of other species are used in Sindh for making the ropes and bands used in wells, as water does not rot them. A few species, as *Marsdenia tinctoria*, a native of Silhet, yield indigo of excellent quality. There are many species native in North America.

Asclepiades, a Greek physician, born at Prusa, in Bithynia, who flourished during the early part of the 1st century B.C. He seems to have wandered about as a not very successful teacher of rhetoric, before he finally settled at Rome, where, by the practice of medicine, he had risen in Cicero's time to considerable fame and wealth. He was opposed to the principles of Hippocrates. Pliny, who professes very little respect for him, reduces his medicinal remedies to five: abstinence from flesh, abstinence from wine under certain circumstances, friction, walking, and 'gestation' or carriage exercise, by which he proposed to open the pores, and let the corpuscles which caused disease escape in perspiration; for his leading doctrine was, that all disease rose from an inharmonious distribution of the small, formless corpuscles of which the body was composed. He also employed emetics and bleeding, but in general consulted the tastes and whims of his patients; his maxim being, that a physician ought to cure surely, swiftly, and agreeably. He is said to have been the first who distinguished between acute and chronic diseases, and the invention of laryngotomy is also ascribed to him; but his knowledge of anatomy was apparently very slight. Gumpert edited the fragments of his writings (Weimar, 1798).

Asclepias (or *Swallow-wort*) is the typical genus of Asclepiadaceæ (q.v.). The species are generally erect, seldom climbing and twining, herbaceous plants with opposite, whorled, or alternate leaves and flowers in umbels. They are mostly American.—*A. cornuti* (formerly called *A. syriaca*), Virginian Swallow-wort, or Virginian Silk, is a native of North America, and not of Syria, as was supposed. It is frequently cultivated in flower-gardens. The young shoots are eaten in North America like asparagus, as those of *A. stipitata* are in Arabia. A brown well-tasted sugar is prepared in Canada from the flowers; and the silk-like down of the seeds has been used for the manufacture of textile fabrics, either alone, or along with wool or silk, but is more frequently employed for the preparation of wadding, and for stuffing mattresses and pillows. The plant appears, however, to be chiefly valuable for the fibre of its stalks, which has been used in a small way for the manufacture of thread and cloth in some

parts of North America. The fibre is said to be of very superior quality, and that of other species furnishes muslin and paper in India. The plant rapidly extends by its creeping root-stocks, and readily becomes a weed.—The roots of several other North American species are used as diaphoretics and expectorants, as *A. incarnata*, *A. tuberosa*, &c. The latter is a very ornamental garden-flower, and is called Butterfly Weed and Pleurisy Root in the United States, where it is frequent on stony and sandy grounds. *A. curassavica* is called Wild Ipecacuanha in the West Indies, and a decoction of it is used by the negroes as an emetic and purgative.—It has been attempted to identify the Soma plant, mentioned in the Vedas as yielding an intoxicating beverage from its bruised stem and leaves, as an *asclepias*.

Ascoli (anc. *Asculum Picenum*), a city of Italy, on the Tronto, 83 miles S. of Ancona by rail. It has a fine cathedral and some Roman remains, and manufactures of majolica and glass-ware, silk, leather, &c. It suffered much from an earthquake in October 1878. Pop. (1881) 11,199.—**ASCOLI** (anc. *Asculum Apulum* or *Satrianum*) is another episcopal city, 19 miles S. of Foggia. Pop. 6478. Pyrrhus here defeated the Romans, 279 B.C.—**ASCOLI PICENO**, a province of Central Italy, belonging to the Marches, with an area of 809 sq. m., and an estimated pop. (1885) of 219,962.

Ascoli, GRAZIADIO ISAIA, Italian philologist, was born of Jewish parentage at Görz in 1829, and was destined for a mercantile career, but early devoted himself to the study of comparative philology. His *Studii Orientali e Linguistici* procured him in 1861 a chair of philology at the Milan Academy, and besides founding the *Archivio Glottologico* (1873), he has published *Fonologia Comparata des Sanscrit, del Greco, e del Latino* (1870), *Studii Critici* (1861-77), &c.

Ascot Heath, a race-course in Berkshire, 29 miles WSW. of London, and 6 SW. of Windsor. It is circular, only 66 yards short of 2 miles in length; the races, which take place early in June, are generally attended by the royal family in semi-state. From the accounts of the Master of Horse for the year 1712, it would appear that they were instituted, not in 1727 as is commonly supposed, but by Queen Anne on August 6, 1711.

Asellio, GASPARO, a celebrated Italian physician, was born at Cremona about 1581, and died in 1626, having been professor of Anatomy and Surgery at Padua. In 1622, while at Milan, he discovered the lacteal vessels, which he seems, however, never to have understood or described with complete accuracy. He left a treatise, *De Lactibus* (1627). See LACTEALS.

Asellus, a generic name now disused, formerly applied to the cod and other Gadidæ. It is retained in the pharmacopœias, in the name of Cod-liver Oil, *Oleum jecoris aselli*.—The same generic name is also employed to denote a genus of small Isopod Crustaceans, one of which, *A. aquaticus*, is common in stagnant ponds in Britain, and is sometimes called the Water Hog-louse. This genus is the type of a family, Asellidæ. See WOOD-LOUSE.

Ases. See ÆSIR, SCANDINAVIAN MYTHOLOGY.

Asgard, the heaven of Scandinavian Mythology (q.v.).

Asgill, JOHN, an eccentric writer, born at Hanley Castle, Worcestershire (1659), was called to the bar in 1692. Having got into difficulties, he sailed in 1699 for Ireland, where an act for the resumption of forfeited estates promised plenty of lawsuits. His talents gained him a lucrative practice; and in 1703 he even obtained a seat in the Irish parliament. Three years before, however, he had pub-

lished a paradoxical pamphlet, bepraised by Coleridge, to prove that by the rules of English law, the redeemed need not die. Much to his own surprise, the public flew into a rage against this absurd production; the Irish parliament voted it a blasphemous libel, and the astonished author was expelled the House. In 1705 he returned to England, and entered the English parliament as member for Bramber, in Sussex. But the fame of his unlucky pamphlet haunted him perpetually; for the English House condemned it to be burned by the common hangman, and expelled Asgill in 1707. At last he found something like peace in the King's Bench and the Fleet, where he continued to practise professionally, and to indite innumerable pamphlets. He died in November 1738.

Ash (*Fraxinus*), a genus of trees belonging to the natural order Oleaceæ, and distinguished by very imperfect flowers, in which the calyx is obsolete, and the corolla either wanting or 3-4-partite; the fruit is a *samar*a, a seed-vessel winged at the edges and extremity. The leaves are deciduous, and are pinnate with a terminal leaflet. There are about fifty species, mostly natives of Europe and of North America.—The Common Ash (*F. excelsior*) grows wild in the middle and south of Europe and north of Asia, and is an undoubted native of Britain. It is a beautiful and umbrageous tree, highly ornamental in parks, but extremely injurious to the grass or crops immediately around it. It rises to the height of 100-150 feet, generally with a smooth stem. The wood is white, tough, and hard, much valued by wheel-wrights, cart-wrights, coach-makers, joiners, and turners. It ranks next in value to that of the oak for strength and durability, and is adapted to a much wider range of uses. It is also excellent for fuel. Sometimes it becomes irregular in the disposition of its fibres, and finely veined, and is then prized by cabinetmakers. The wood of the young trees is almost as valuable as that of the old. Indeed, the value of the timber is greatest in trees of which the growth has been rapid, as it exhibits the characteristic toughness in the highest degree. The ash prefers a loamy soil, but grows in almost any, and succeeds in situations too elevated or too exposed for most other trees. Cultivation has produced and perpetuated a number of varieties, of which the most remarkable are the Weeping Ash, with boughs bent almost straight down to the ground; the Curl-leaved Ash, with dark-green wrinkled or curled leaves; and the Entire-leaved Ash, a very curious variety, with many or all of the leaves simple (not pinnated), which has been erroneously regarded by some botanists as a distinct species, and named *F. simplicifolia*, *F. heterophylla*, &c.—The Small-leaved Ash (*F. parvifolia*) and the Lentisk Ash (*F. lentiscifolia*) are both natives of the shores of the Mediterranean, and are very graceful and ornamental trees.—The American Ash, or White Ash (*F. americana*), is readily distinguished from the Common Ash by its lighter bark and paler green leaves. It is abundant in New Brunswick and Canada, but becomes rare to the south of New Jersey. The trunk often rises more than 40 feet undivided. The wood is used for the same purposes as that of the Common Ash.—The Red Ash, or Black Ash (*F. pubescens*), is very similar, but of smaller size, and has a deep brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground.—The Black Ash, or Water Ash of the New England States, New Brunswick, &c. (*F. sambucifolia*), is a large tree with buds of a deep blue colour.—The Blue Ash of Ohio, Kentucky, Tennessee, &c. (*F. quadrangulata*), is also a large tree. The branches are quadrangular, the young shoots having on the angles four membranes

which extend their whole length.—The Green Ash (*F. juglandifolia*), readily recognised by the brilliant green of its young shoots, is chiefly found in the middle States; and the Carolina Ash (*F. caroliniana*), remarkable for the great size of its leaflets, chiefly in the southern States. Besides

Branch of Common Ash (*Frazinus excelsior*): a, fruit.

these, North America produces a considerable number of other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the Common Ash, but none of them have proved of any value as forest trees in this country, in so far as experience gained from limited experiments in that direction shows.

Among other trees bearing the name ash in one form or other is the Manna Ash, or Flowering Ash (*Ornus europæa*), closely related to the true ash, and formerly named *F. ornus*, but now, on account of some structural distinctions in its flowers, generally regarded as a separate genus. The tree strongly resembles the Common Ash in foliage, but is smaller, and cannot be considered a timber tree of any importance. It is a native of the south of Europe, and is very abundant in Sicily, whence the finest manna is obtained. An allied species (*O. rotundifolia*), a native of Greece and the Ionian Islands, also produces manna in quantity, but not equal in quality to that of the other species. Manna is the concrete juice of these two trees, and is obtained by means of transverse incisions in the bark, but it often also exudes spontaneously during the heat of summer.—The Mountain Ash, or Rowan Tree (q.v.), so called on account of the resemblance of its foliage to that of the Common Ash, belongs to the natural order Rosaceæ.

The ash has a peculiar importance in Scandinavian mythology. The first man and woman formed were Ask and Embla (Ash and Elm). The court of the gods is represented in the Edda as held under an ash, called Yggdrasil (q.v.). The ash was in many countries, and from ancient times, believed to be a powerful defence against witches, fairies, poisonous animals, and some diseases. In the Highlands of Scotland, ash sap was administered to infants as their first food; elsewhere, herd-boys preferred an ash rod as a herding stick; in Cornwall a single blow from an ash wand was death to an adder. Gilbert White tells that in Selborne ruptured children used to be passed naked between the sides of a cleft ash tree in order to be healed. It was held dangerous

to break a bough from the ash. The Mountain Ash (see ROWAN) had also magical powers.

The Poison Ash (*Rhus venenata*) is a gum or varnish bearing tree or shrub of North America, and belongs to the natural order Anacardiaceæ.—The Bitter Ash (*Simaruba officinalis*) yields the powerful tonic drug known as *Simaruba Bark*. The tree is a native of the West Indies.—The Cape Ash (*Ekebergia capensis*) is a valuable timber tree of the Cape of Good Hope; among the timber trees of the Cape it occupies a similar position to the Common Ash in this country, but is in no way related to the latter; it belongs to the natural order Meliaceæ.—Prickly Ash (*Xanthoxylum fraxineum*) is a native of the United States, where it is also called Toothache Tree. The bark, the leaves, and seed-vessels abound in volatile, aromatic, oily and resinous constituents, and a peculiar principle named Xanthoxylin, which are used in the United States in various forms for the cure of toothache and chronic rheumatism.

Ashango, a tribe of Western Equatorial Africa, inhabiting a thickly-wooded plateau (1000 to 1500 feet) south of the Ogowé, 230 miles from the Atlantic coast. They are great slave-holders, are very superstitious, and are broken up into several sub-tribes. Among these are the Obongo, a race of hairy, yellow-skinned dwarfs, whose average height does not exceed 4 feet 4 inches. See Du Chaillu, *A Journey to Ashango-Land* (1867).

Ashanti, or ASHANTEE, a negro kingdom in Western Africa, on the north of the Gold Coast, extending 5°–9° N. lat., and 0°–4° W. long., and shut off from the seaboard by the British protectorate, 80 miles broad, of the Gold Coast colony. It is hilly and well watered, but none too healthy, especially in the lower alluvial districts. The principal rivers are the Volta, Pra, and Assinie. Population estimated at from 1,000,000 to 3,000,000, of whom a fifth are warriors. The country proper is one continuous forest; the land in the neighbourhood of the towns is carefully cultivated. The land is extremely fertile, producing maize, millet, rice, yams, tobacco, sugar, cocoa, the pine-apple, and other fine fruits, with gums, dye-woods, and timber. The principal exports are gold-dust, of which a considerable quantity is found, and palm-oil, together with slaves. The natives are remarkable for their skill in certain articles of manufacture; their cottons are beautiful, as also their earthenware and sword-blades. Human sacrifice is practised, and polygamy indulged in, the king being allowed 3333 wives. The capital is Coomassie (q.v.). Kpando, near the Volta, is an important centre of trade. So is Salaga or Paraha, which before the war of 1874 had an estimated population of 40,000.

The beginnings of the Ashanti kingdom are obscure, but its traditions point to an emigration some hundreds of years ago from a region north of the Kong Mountains, probably caused by the spread of the Mohammedan empire of Timbuctoo. Our first positive glimpse of it is got in the year 1700, when Coomassie was made the capital by Osei Tutu, who conquered Akim, Assin, Gaman, Denkira, and other neighbouring states, and became a sort of feudal sovereign over a large district. In their course of conquest over the Fantees, the Ashantis became involved in war with the British (1807–26), and were finally driven from the sea-coast. In 1873–74, in consequence of disputes arising in connection with the cession of the Dutch forts to Britain, they were again involved in a war with the same power; and an army under Sir Garnet Wolseley forced its way to the centre of the kingdom. After a severe battle at Amoafu, and several days' fighting, Coomassie was taken,

February 4, 1874, and burned on the 6th, and, though the rainy season had set in, the army returned in safety to the coast. The king of Ashanti renounced all claims on the protectorate of Gold Coast Colony, promised to protect traders, and pay an indemnity of 50,000 ounces of gold to the Queen. In 1876 hostilities took place between the Ashantis and the Juabins, when the latter were defeated, and sought refuge within the British protectorate. See works by Bowdich (1819, new ed. 1873), Brackenbury (1874), W. Reade (1874), Stanley (1874), and Weitbrecht (1875).

Ashborne, a pleasant market-town of Derbyshire, 13 miles NW. of Derby. Its church (1241) has a fine spire, the 'Pride of the Peak,' 212 feet high, and an exquisite monument by Banks. There are also a grammar-school (1585) and a market-hall (1861). Prince Charles Edward was here in 1745, and here Moore wrote great part of *Lalla Rookh*. Pop. (1881) 3485.

Ashburton, a small town in the south of Devonshire, on the borders of Dartmoor, 9½ miles NNW. of Totnes by rail. Till 1868 it returned a member to parliament. Pop. 2891.

Ashburton, ALEXANDER BARING, LORD, born in 1774, second son of Sir Francis Baring (q.v.), was for several years engaged in the United States, in the service of the great London mercantile house established by his father. On the death of the latter in 1810, he became the head of Baring Brothers & Co., having four years before been elected member for Taunton. He represented that place, Callington, and Thetford in the Liberal interest till 1832, and in 1833 was returned for North Essex as a moderate Conservative. In Peel's brief administration (1834-35) he was President of the Board of Trade, and was created Baron Ashburton in 1835. In 1842 his knowledge of business, and thorough acquaintance with American institutions, caused him to be appointed special ambassador to the United States to settle the north-west boundary question, and other disputes, which then threatened to involve the two countries in war. In August of that year he concluded the famous treaty of Washington, commonly called the Ashburton Treaty, by which the frontier line between the state of Maine and Canada was definitely agreed to. Seven-twelfths of the disputed territory, and the British settlement of Madawaska, were given by it to the United States; but it secured a better military frontier to Britain, and included heights commanding the St Lawrence, which the award of the king of Holland had assigned to the Americans. Provisions were also made for putting an end to the African slave-trade, and for the mutual extradition of criminals. Lord Ashburton opposed free-trade, but strongly supported the penny-postage system when first proposed by Rowland Hill in 1837. He died May 13, 1848.—His son, WILLIAM BINGHAM BARING, second Lord Ashburton (1799-1864), held two or three offices, but is chiefly remembered through his first wife, who made their house a meeting-place of politicians and men of letters, among the latter Thackeray and Carlyle.

Ashburton River, an unnavigable stream of Western Australia, rising in the mountains west of the Great Desert, and flowing 400 miles north-westward into Exmouth Gulf. Its lower course was explored by Sholl in 1866, its upper by Giles in 1876.

Ashby-de-la-Zouch, a town of Leicestershire, near the source of the Mease, a tributary of the Trent, 18 miles NW. of Leicester. It owes its suffix to the Norman family of La Zouch. Their ruined castle, celebrated in Scott's *Ivanhoe*, and rebuilt in 1480 by Sir William Hastings, crowns a

height to the south of the town. Mary, Queen of Scots, was imprisoned here. In the church are the tombs of the Hastings or Huntingdon family. Leather is the staple industry. Pop. (1881) 4536.

Ashdod, the New Testament AZOTUS (now *Esdud*), a village on the Mediterranean, 21 miles S. of Jaffa. It was formerly one of the chief cities of the Philistines, strongly fortified, and the scene of numerous contests between that race and the Jews. Into this city the ark of the covenant was brought by the Philistines, and placed in the temple of their god Dagon. About 715 B.C. the town was taken by Tartan, general of the Assyrians; and in the following century it was captured by the Egyptians, under Psammetichus, after a twenty-nine years' blockade and siege. It was destroyed by the Maccabees, and though afterwards rebuilt by the Romans, never regained its early importance. Esdud is now a miserable village with a population of about 300.

Ashdown, the seat of Lord Craven, in West Berkshire, 3½ miles NW. of Lambourn. Here, in 871, Ethelred and Alfred gained the great victory of *Æscudun* over the Danes.

Ashe'ra, the name of a Phœnician goddess, or rather of the idol itself by which the goddess was symbolised. The name is frequently mentioned in the Old Testament in connection with Ashtoreth and her worship, and it appears certain that the latter is the proper name of the goddess, while Ashera is her image or symbol. The image was always of wood, and the most probable etymology of the name (Heb. *āshēr* = *yāshar*, 'to be straight') seems to point to the phallic emblem and the licentious rites associated with the worship of Ashtoreth. The translators of the Authorised Version, following the renderings of the Septuagint and the Vulgate, translated the word by 'grove,' spite of the difficulties offered by such passages as 2 Kings, xxi. 7, and xxiii. 6; but this error has disappeared in the Revised Version.

Ashes, the remains of animal and vegetable bodies after burning. It is not strictly correct to speak of the ashes of a mineral. When lead, for instance, is exposed to heat, it turns to dross, which has the appearance of ashes, but is merely the lead combined with oxygen. In the same way, volcanic ashes, as they are called, are only a finer kind of pumice-stone, the solidified scum of molten lava. The ashes of organic substances destroyed by fire consist of the fixed salts contained in these substances. In land-plants, the most important are salts of potash, along with silica and lime; in sea-plants, soda takes the place of potash. By lixiviation of the ashes, the potash or soda is dissolved and separated from the insoluble mass, and is then purified by crystallisation. The ashes of sea-plants contain also more or less iodine. Peat and turf ashes contain, besides alkalies, more or less clay and sand; the same is true of pit-coal, which sometimes contains iron.

At one time the ashes or inorganic ingredients of plants were considered unessential to their existence. But the progress of vegetable chemistry has taught that a certain proportion of saline food is absolutely necessary to the development of plants. The analysis of the ashes of the different kinds of vegetable substances has since become of great interest.

The ashes of animal bodies do not differ greatly from those of vegetables. Bone-ashes consist essentially of lime united with phosphoric acid. This bone-earth is very valuable as manure for grain. In well-wooded countries, ashes from burnt wood form an article of considerable trade. They are much used in the processes of soap-boiling, bleaching, dyeing, glass-making, &c. Wood-ashes

are also used in washing and other domestic processes, as a cheap preparation of Potash (q.v.), better known under the names American ashes or pearl-ash.

The presence or absence of ashes is frequently a most important factor in deciding as to the adulteration of articles of commerce. Thus if a sample of milk, flour, mustard, or other substance, on being dried and incinerated, with the necessary precautions, yields more ash than is normally present, it is strong evidence of adulteration, and the analyst can then apply his tests to the ashes obtained, and so determine the nature of the substance which has been added. For volcanic ash, see VOLCANO.

Ashford, a market-town of Kent, 14 miles SW. of Canterbury, and 56 SE. of London. It is an important railway junction, and the seat of the South-eastern Railway workshops. Eastwell Park, occupied by the Duke of Edinburgh, lies 3 miles to the north. Pop. (1851) 4092; (1881) 9693.

Ashington, a parish of South Essex, 2½ miles N. of Rochford. Here, in the battle of Assandun (1016), the sixth fought in the year, Canute defeated Edmund Ironside.

Ashkenaz, the name of a northern people mentioned in the table of races given in Gen. x., located in Armenia or its neighbourhood. The later Jews identified it with Germany. At the present day, the Polish and German Jews are termed *Ashkenazim*, as opposed to the *Sephardim*, the Spanish and Portuguese Jews. They have different synagogues, in which a somewhat different ritual and a different pronunciation of Hebrew are used, though there is no doctrinal distinction, nor now any disinclination to social intercourse and intermarriage.

Ashland, a post-borough of Schuylkill county, Pennsylvania, 119 miles NW. of Philadelphia by rail. It depends principally upon its rich mines of anthracite coal; but it has also foundries, machine-shops, and several mills. Pop. (1880) 6052; (1887) 8000.

Ashlar, or **ASHLER**, building-stone squared and hewn, as distinguished from rubble or rough stones which are used as they come from the quarry without being dressed. Ashlar is laid in regular courses in building, and is of various kinds, according to the style of working that side of the stone which is to form the facing of the wall.

Thus there are *tooled* ashlar—the marks of the tooling being either *random* or in *grooves*; *polished* ashlar, in which the face of the stone is rubbed smooth; and *rustic* ashlar, in which only the joints are accurately hewn, the face of the stone being left projecting irregularly. Quarriers apply the term ashlar to squared stones before being hewn. The word is derived through the old Fr. *aisseler*, from Lat. *axillaris*, which is from *axilla*, a diminutive of *axis*, 'axle,' 'plank.' In old documents, the term appears under a variety of forms, such as *achlere*, *ashelar*, *aslure*, and *estlar*.

Ashley, LORD. See SHAFTESBURY.

Ashmole, ELIAS, antiquary, was born at Lichfield, 23d May 1617, and commencing the study of law when only sixteen, in 1638 became a solicitor. During the Great Rebellion he embraced the Royalist cause, and was appointed a captain of

horse and comptroller of the Ordnance; but at the same time exhibited his love of study by entering Brazenose College, Oxford, where he sedulously applied himself to mathematics, natural philosophy, astronomy, astrology, and alchemy. In 1648 he became acquainted with Lilly and other famous astrologers; and in 1650 he edited a work of Dr Dee's, to which he subjoined a treatise of his own. In 1652 he issued his *Theatrum Chymicum*, and in 1672 his *magnum opus*, a *History of the Order of the Garter*. At the Restoration, various honours and emoluments were conferred upon him; and thenceforward he mainly devoted himself to heraldic and antiquarian studies. In 1682 he presented to the university of Oxford a fine collection of rarities, bequeathed him by his old friend Tradescant, and known as the Ashmolean Museum. He died 18th May 1692. Among his friends were Selden and Dugdale, whose daughter became his third wife. See his quaint Diary (1717).

Ashmun, JEHUDI, an American philanthropist, was born at Champlain, New York, in 1794. He was educated for the ministry, but eventually became editor of a magazine in which he advocated the views of the African Colonisation Society for founding a colony of liberated negroes on the west coast of Africa. Receiving an appointment as one of the agents of this association, he conducted a body of liberated negroes from Baltimore, and landed at Cape Mesurado, the seat of the infant colony of Liberia, in the autumn of 1822, and assumed the superintendence of affairs. Here, for more than six years, he devoted himself to establishing, on a fair and solid basis, this colony, so full of hope for the American negro (see LIBERIA). His health failing, he returned to America, and died at New Haven, Connecticut, 25th August 1828. See his *Life*, by R. R. Gurley (1835).

Ashraf, a town in the Persian province of Mazanderan, near the south coast of the Caspian Sea, 56 miles W. of Astrabad. It was a favourite residence of Shah Abbas the Great, and was adorned by him with splendid buildings, of which only a few miserable ruins now remain. It still contains over 800 houses, and has some trade in the cotton and silk produced in its vicinity.

Ashtabula, a rapidly increasing town of the state of Ohio, U.S., on the Cleveland and Erie Railway, 3 miles from Lake Erie, and 49 miles NE. of Cleveland. Pop. (1880) 4445; (1890) 8338.

Ash'taroth. See ASTARTE.

Ashton-in-Makerfield, a township in South Lancashire, 4 miles S. of Wigan. Pop. (1881) 9825, chiefly engaged in collieries, and in the hardware manufacture.

Ashton-under-Lyne, a town of South-east Lancashire, 6½ miles E. of Manchester. It was enfranchised in 1832, and returns one member to parliament. A great seat of the cotton manufacture, it suffered severely during the cotton famine (1861-65). The population is also employed in bleaching, dyeing, and calico-printing, in collieries, and in the manufacture of machines, bricks, &c. Among the buildings are the town-hall (1841), the infirmary (1860), and the old parish church, with tombs of the Assheton family, from whom the town got its name. Pop. (1851) 29,791; (1891) 40,494.

Ash-Wednesday, the first day of Lent (q.v.), so called from the Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom, probably introduced by Gregory the Great (590-604), was sanctioned by Pope Celestin III. in 1191, and afterwards generally prevailed. Before mass, the ashes are consecrated on the altar, sprinkled with holy water, and signed three times

Ashlar.

with the cross, while the priest recites the words, *Memento quod cinis es, et in cinerem reverteris* ('Remember that thou art dust, and into dust thou shalt return'). Next they are strewed on the heads of the officiating priests, the clergy, and the assembled people. The ashes are those of the palms consecrated on the preceding Palm Sunday (q.v.).—The Protestant Church in Germany does not celebrate Ash-Wednesday. In the Church of England it is observed, but without anything of the ceremony from which it derives its name; and the *Commination* (q.v.) is appointed to be read in the service for this day.

Asia, the largest of the divisions of the world, occupies the northern portion of the eastern hemisphere in the form of a massive continent which extends beyond the Arctic circle, and by its southern peninsulas nearly reaches the equator. The origin of its name remains unknown. Herodotus failed to explain it; modern philology has also failed. It appears, however, most probable—the first elements of our geographical terminology having originated in Greece—that Asia was a local name given to the plains of Ephesus, and that this name was gradually extended to the Anatolian peninsula, and later on to the whole of the continent.

Viewed in their broad features, Europe and Asia constitute but one continent, extending from west to east, and having the shape of an immense triangle, the angles of which are Spain in the west, the peninsula of the Tchuktchis in the north-east, and that of Malacca in the south-east. The Arctic Ocean in the north, the Pacific in the east, and the Indian Ocean, continued by its narrow gulf, the Red Sea, which nearly reaches the Mediterranean, inclose the continent of Asia. This immense mass of land touches the latitude of 77° 34' N. in Cape Tchelyuskin, while Cape Barro, at the extremity of the peninsula of Malacca, and 5350 miles distant from the former, falls short by 1° 15' of reaching the equator. Cape Baba, in Asia Minor, advances as far west as the 26th degree of longitude, and the utmost N.E. extremity of Asia—East Cape, 5990 miles distant from Cape Baba—protrudes to the 190th degree (12 hours 40 minutes) to the east of Greenwich. The area covered by Asia and its islands is 17,255,890 sq. m.; that is, almost exactly one-third of the land-surface of the globe (32 per cent.). It is a seventh larger than the surface of both Americas together, by one-half larger than that of Africa, and more than four times larger than that of Europe.

Boundaries.—Neither by its geographical features nor by its climate, vegetation, and animals, still less by the ethnographical features of its inhabitants and their history, can Asia be sharply separated from Europe. The physical features of both continents show a manifold interdependence; and however pronounced the individuality of Europe in the west, it melts into Asia in its eastern parts; while throughout its history Europe has been influenced by Asia in a thousand ways. Our races have been mixed with those of Asia; in Asia our civilisation, our religions, our political and social institutions have had their origin; and ever since Europe made an independent start in history, it has never ceased to feel the influence of Asia. Geographically speaking, Europe is a mere appendix to Asia, and no exact geographical delimitation of the two continents is possible. The low Urals are not even an administrative frontier: European Russia extends over their eastern slope. Farther south, the dry steppes of Asia penetrate into Europe; and pass indistinguishably into the prairies of Russia. Caucasus is surely Asiatic in character; but, to separate it from Europe, one must resort to

the old dried-up channel of the two Manytch rivers, which at a geologically recent epoch connected the Black Sea with the Caspian. As to Asia Minor—also purely Asiatic in structure and inhabitants—it so closely approaches Europe that the Sea of Marmora and its narrow river-like straits seem almost an artificial boundary, while the islands surrounding Asia Minor mingle with those which continue Greece to the east, and the Anatolian plateau seems to be continued in the Balkan Peninsula.

The line of separation from Africa is better defined by the narrow Red Sea. But Arabia participates so largely in the physical features of Africa that it is in a sense intermediate between the two continents.

In the south-east, the numberless islands of the Dutch Indies—relics of a sunken continent—appear as a bridge towards Australia; and although a boundary between Australia and Asia has been drawn through the Timor Sea, or rather between the islands Bali and Lombok, in the Sunda Archipelago, still it is a boundary only in a limited sense: it only separates two faunas.

In the extreme north-east, Asia sends out a peninsula to meet one of the Alaskan peninsulas in America, from which it is separated only by a shallow and narrow channel, Behring Strait. Plants, animals, and men freely migrated over this ferry; while the geographer sees in the two peninsulas a line of connection between the two great plateaus of the Old and New World.

Peninsulas.—Although the coasts of Asia are much more indented by gulfs and peninsulas than those of Africa or America, still it stands in this respect much behind Europe, and has 1 mile of coast-line for every 337 sq. m. of its area, that is, three times less than Europe; besides, about one-fifth of its shores is washed by the ice-bound Arctic Ocean (9900 miles out of 51,000), or by the foggy and icy sea of Okhotsk, where navigation is possible only for a few months, or even weeks, in each year. Its peninsulas comprise nearly one-fifth of its surface (19 per cent., as against 28 in Europe), but they partake of the massive structure of the continent: they are massive too, and, as a rule, little indented. Three immense offsets continue the continent of Asia into more tropical latitudes—Arabia, India, and the Indo-Chinese Peninsula—and some likeness exists between them and the three southern peninsulas of Europe—Spain, Italy, and the Balkan Peninsula, surrounded by its archipelago of hundreds of islands. Asia Minor protrudes between the Black Sea and the Mediterranean as a huge mass of tableland broken by narrow gulfs in its western parts. In the Pacific there are only three large peninsulas—Corea, Kamchatka, and that of the Tchuktchis—the whole of the Pacific coast having the shape of wide curves turning their convexity to the sea, and indented by but a few gulfs. The flat, ever frozen, uninhabitable peninsulas of the Arctic Ocean, Taimyr and Yalmal, could play no part in the growth of civilisation.

Seas, Coasts.—The early inhabitants of Asia had no Mediterranean Sea to serve as a high-way of communication between the southern peninsulas. The gulfs which separate them—the Arabian Sea and the Bay of Bengal—are wide, open divisions of the Indian Ocean. The narrow, elongated Red Sea penetrates between the dry, stony, and barren lands of Africa and Arabia; and only now, since it has been brought into communication with the Mediterranean by the Suez Canal, has it become an important channel of traffic. The Persian Gulf, inclosed between the deserts of Arabia and the mountains of Persia, is bordered by regions scarcely

inhabited. Asia's true Mediterranean is on the east, where several archipelagoes, like so many chains of islands, mark off from the ocean the Southern and Eastern China Seas, whose Gulfs of Siam and Tonkin, and especially the Yellow Sea with the Gulf of Pechili, penetrate into the continent. Those gulfs, since the dawn of history, have promoted the development of marine traffic in these regions, and would have done so still more but for the dreadful typhoons, the constant danger of these seas. The Sea of Japan is less favoured by climate and currents, and it has on its west the inhospitable coasts of Northern Manchuria, where Russia is trying to establish a maritime centre at Peter the Great Bay. The Sea of Okhotsk and that of Behring, although possessing fine gulfs (Ghizhiga, Anadyr), have no importance for the maritime traffic of nations. Still less the Arctic Ocean, with its wide estuaries and bays, and the Kara Sea, through which ships find a passage amidst the broken ice-crust for only a few weeks in the year.

Islands.—The islands of Asia are very numerous, and cover an aggregate of no less than 1,023,000 sq. m. (nearly 6 per cent. of Asia's surface). The coasts of Asia Minor are dotted with islands, of which the Sporades connect it with Greece. Cyprus was, from remote antiquity, a centre of civilisation; so also Ceylon. The Laccadives and Maldives are mere coral atolls, rising amidst the Indian Ocean, and sheltering some 200,000 inhabitants. The islands of East Asia are much more important. A narrow strip of islands, some large like Sumatra (177,000 sq. m.) and Java, others mere reefs, extend in a wide semicircle, under the name of Andaman and Sunda Islands, from Burmah to Australia, separating the Indian Ocean from the shallow Java Sea and the Malay Archipelago. This last—an immense volcanic region inhabited by the Malay race—comprises the huge Borneo, the ramified Celebes, and the numberless small islands of the Moluccas, the Philippines, &c., connected on the north-west with the Chinese coast by the island of Formosa. This latter, as well as Hainan, may be properly considered as part of the Chinese mainland. The Loo-choo (Liu-kiu) Islands and the Japanese Archipelago, the latter joining Kamchatka by the Kuriles, continue farther NE. this chain of islands which border the coasts of Asia. Sakhalin is so closely situated to the continent that it was long regarded as a peninsula. In the Arctic Ocean, the small Bear Islands, the archipelago of the Liakhof, Anjou, and De Long Islands, as also those of the Kara Sea, are lost amidst ice-fields, and are but occasionally visited by whalers. Kellett's, or Wrangel's Land, off the peninsula of the Tchuktchis, has been merely sighted, not yet visited.

Orography.—Asia is at once the largest and the highest of all continents. Not only has it a number of mountains which exceed by five and six thousand feet the loftiest summits of the Andes; it has also the highest and the most extensive plateaus. If the whole mass of its mountains and plateaus were uniformly spread over its surface, the continent would rise no less than 2885 feet above the sea, while Africa and North America would respectively reach only 2165 and 1950 feet.

High plateaus are the predominant feature of Asia's orographical structure; they occupy nearly two-fifths of its area. One of them—that of Western Asia, including Anatolia, Armenia, and Iran—extends in a south-easterly direction from the Black Sea to the valley of the Indus; while the other—the high plateau of Eastern Asia, still loftier and much more extensive—stretches NE. from the Himalayas to the north-eastern extremity of Asia, resembling in shape a South America pointing NE.,

and meeting at Behring Strait the north-western extremity of the high plateau of North America. These vast regions, mostly unfit for agriculture and human settlement, poorly watered over wide areas, and assuming there the character of dry deserts, divide Asia into two parts—the lowlands of Siberia and the Aral-Caspian depression to the north of the plateau-girdle, and the lowlands of Mesopotamia, India, and China to the south. These could enter into only occasional communication across the thinly peopled plateaus, and they have followed quite independent lines of development. The southern lowlands are themselves separated into three distinct parts, which have developed independently, without enjoying that continuous mutual intercourse which constitutes the distinctive feature of European civilisation.

(1) *Plateau of Eastern Asia.*—The high plateau of Eastern Asia, which stretches for 4500 miles to the NE. from the Himalayas, occupies more than one-fifth of the superficies of Asia. Its surface is not quite flat, as the rather inappropriate orographical name of 'plateau' might suggest. It has its depressions; it has also on its north-western borders several broad trenches which are cut in its mass, like gigantic railway-trenches leading with an imperceptible gradient from the lowlands to the heights of the plateau. For many consecutive geological periods these trenches were either channels for the drainage of the waters discharged by the plateau, or else gulfs of the seas which surrounded it, so that now their banks, water and glacier worn, appear like chains of mountains to the traveller who follows their flat bottoms. The plateau has also mountain-ridges rising several thousand feet above its surface, and high border-ridges. But its depressions do not sink to the level of the lowlands, their lowest parts being still two or three thousand feet above the sea; while the chains of mountains, although rising to high absolute altitudes, are still relatively low, their bases on the plateau being at a level of several thousand feet above the sea. They do not display the diversified aspect usually characteristic of alpine regions intersected by deep fertile valleys; and unvaried monotony—monotony of orographical features, climate, flora, and fauna—remains the distinctive feature of the plateau over immense distances. For thousands of miles the traveller finds the same broad and open valleys, the same harsh climate, the same species of plants and animals, the same unfitness for agriculture.

The highest parts of the East Asian plateau are in Tibet, where it has a width of 1600 miles from west to east, and an average height of 18,000 feet. Even the bottoms of its lowest valleys are at a higher altitude than the summit of Mont Blanc, and only cattle-breeding is possible in these high, cold, dry valleys. The highest plateau of the earth is girdled by the highest chain of mountains, the Himalayas—a typical 'border-ridge' which has one foot on the high plateau, and the other in valleys ten to fifteen thousand feet deeper, where the palm and vine grow freely. This immense chain of snow-clad peaks, which in Europe would reach from Gibraltar to Greece, raises its lofty summits above 20,000 feet; its lowest passes are 15,000 feet high, and Gaurisankar or Mount Everest—the highest mountain of the globe—has its snow-cap at a height of 29,000 feet, that is, 5½ miles above the sea. A series of chains separated from the Himalayas by high longitudinal valleys run parallel to them in the north, and of these, the Karakorum Mountains rise high above the snow-line; their loftiest peak, the Dapsang, is 28,700 feet high. In the east, the plateau of Tibet is bordered by the snow-clad mountains through which the great rivers of China, Burmah, and

Siam find their way to the lowlands. They are still very little known.

In the north-west, the Tibet plateau joins another much smaller, but very high plateau—that of Pamir ('the roof of the world'), which covers an area of 37,000 sq. m. Several chains of mountains running NE. diversify its surface, but still the travellers crossing it need not descend to a level lower than from 10,000 to 11,000 feet until they have crossed its northern border-ridge, the Alai Mountains, whose peak Kaufmann (22,500 feet) exceeds twice the highest summit of the Pyrenees. The Tagarma peak, in Eastern Pamir, reaches a height of 25,800 feet. Farther north and north-east of the Pamir, a wide, intricate complex of several high chains, running mostly from WSW. to ENE., with several ridges shooting from them to the NW., covers an aggregate area nearly as large as Germany. These mountains are known under the general name of Tian-shan (q.v.). The great Khan-tengri rises there to 24,000 feet, and most of the Tian-shan ridges are snow-clad; even the outer ridges raise their summits to fifteen or sixteen thousand feet—that is, above the upper limits of tree vegetation, while some of their deep, fertile valleys have been transformed into veritable gardens and granaries by means of irrigation.

(2) *Central Asian Depression.*—In the north, the plateau of Tibet is bordered by a succession of lofty chains (Kuen-lun, Altyn-tagh, Nañ-shan), reaching more than 20,000 feet in their highest parts. These chains separate it from the great central depression which is occupied by Eastern Turkestan in the west, and by the Desert of Gobi in the east. This great depression—including the Han-hai, or 'dried-up sea,' of the basin of the Tarim—must be considered, however, only as a lower terrace of the great plateau of Eastern Asia. It has an altitude of from 3000 to 4000 feet in the west, and 2200 feet in its lowest part—the depression of Lake Lob-nor. It has no outlet to the sea—not even to Lake Aral or the Caspian; the winds which might bring the moisture of the ocean are deprived of it in crossing the higher plateaus and border-ridges which surround it, and this immense bottom of an immense interior sea is rapidly drying up. All through the historical period it has continued to dry up, till Lob-nor, which covers an area four times as large as that of the Lake of Geneva, has become now but a wide marsh, with a maximum depth of some 15 feet—a small remnant of a much larger sea which existed at the dawn of history, and in whose rapid desiccation we probably must look for one of the causes which impelled the Huns and the Mongols to their great migrations towards the west. Human settlements, secluded from the rest of the continent, and rarely visited now by a few caravans, are scattered only in the upper parts of the tributaries of the Tarim, where the water of few and scanty rivers may maintain life; but they were much more numerous before, as is testified by ruins of great cities, now buried under the drifting sands. In the Eastern Gobi, where the SE. monsoons of the Pacific during the summer and the NW. winds from Siberia during the winter still bring some moisture, the gravelly soil is covered with grass for a few months each year; but in the west, man must sustain a hard struggle against the moving sands raised by storms in the air, more dreaded than the worst snow-storms of the far north. In the south-east, towards the chains of Ala-shan and In-shan, the wild horse and the wild camel—ancestors of our domesticated breeds—find their last refuge on lonely pastures scarcely ever visited by man.

(3) *Northern Part of the Great Plateau.*—The dry and barren ridge called Eastern Tian-shan,

and two other ridges running NW., separate the Han-hai depression of Central Asia from the trenches of Urumtsi and Urungu, which descend west to the lowlands of Siberia towards Lakes Balkhash and Zaisan. Beyond the great depression the plateau rises again, and reaches an average height of from 4000 to more than 5000 feet in the upper parts of the Yenisei and Selenga, and about 2000 feet in its lowest part—the small depression of Lake Ubsa-nor. The Ektagh (or Great Altai) in the west, the Khangai and the Yablonovoi ridge farther east, separate this upper terrace of the plateau from the lower terrace of Eastern Turkestan and Gobi. It would seem that the Yablonovoi ridge is continued farther SW. by a succession of ridges which probably join the Tian-shan Pelau (Eastern Tian-shan), and which separate the higher Siberian terrace of the plateaus from the lower terrace of the Gobi. This last has in the east its border-ridge—the Great Khingan (6000 to 8000 feet)—which is a continuation of the mountains of the middle Hoang-ho; it is pierced by the Amur below Albazin, and in the north-east joins the Stanovoi or Okhotak coast-ridge. See SIBERIA.

In the north-west, the plateau is bordered by the snow-clad Sailughem ridge of the Altai (8000 to 9000 feet), which appears as a continuation of the Tian-shan and the Ala-tau, and which is continued farther NE. by the West Sayans. A wide indentation, however, occupied in its deepest parts by Lake Baikal (and very much like the indentation made by the Caspian in the plateau of Western Asia), breaks the continuity of the border-ridge. This last reappears again in the east of the Siberian lake as a huge wall, known under the names of Khamar-daban, Barguzin, Muya, and Tchara mountains. They rise from 6000 to 8000 feet above the sea, reaching the snow-line only in the Munku-Sardyk (11,900 feet), and presenting their steepest slopes towards Siberia, while their inner base lies on a plateau 3500 to 4500 feet high. This immense wall is pierced by the broad trench-like valleys of the Selenga and its tributary the Uda, which are respectively the two great highways from Lake Baikal to Mongolia and the Upper Amur. A broad zone of alpine tracts more than 150 miles wide and 2000 miles long—the Altai, the Kuznetskiy Ala-tau, the Baikal, Lena, Olekma, and Vitim mountains—fringes this plateau in the west, from Lake Zaisan to the far north-east of Siberia. It consists of a series of short chains, mostly running NE., with numerous spurs, and intersected by deep and narrow valleys, clothed with forests and rich in auriferous deposits. A like succession of alpine tracts, although narrower, follows the south-east edge of the plateau in China and Manchuria. As to the plateau itself—whose surface is diversified by several chains rising above its level—its broad, flat, and open valleys, unfit for agriculture in consequence of their altitude, have none of the dryness of the plateau of Tibet. They are covered with a rich grass-vegetation, and are frequented by shepherds; while the slopes of the hills, thickly clothed with forests, are rich hunting-grounds. Farther north—in the Vitim plateau, the Utchur, &c.—the surface becomes very marshy, and the vegetation still poorer; its height does not now exceed 3500 feet, and it becomes narrower. Its north-eastern extremity—the abode of the Tchuktchis—is but very little known.

(4) *The Plateau of Western Asia.*—Several parallel chains of mountains, reaching 24,000 feet in their highest parts, and running NE. to SW.—the Hindu-Kush and its parallel chains—connect the great plateau of Eastern with that of Western Asia, which may be subdivided into three parts: Iran, Armenia, and Asia Minor. The plateau of Iran (425,000 sq. m.) is bordered in the north-east

by the border-ridges of the Paropamisus, the Kopet-dagh, which presents its steep, stony slopes to the Turcoman Steppes, and the Elburz (with its peak Demavend, 20,100 feet high), which describes a curve around the South Caspian shore; in the east it is fringed by several snow-clad chains, which separate the stony plateaus of Afghanistan and Beluchistan from the fertile valley of the Indus; and in the south-west it falls by several steep terraces towards the Persian Gulf and its continuation—the valley of the Tigris and Euphrates. The lowest parts of the Iran plateau, in the valley of the Helmand, which discharges its water into the rapidly desiccating Lake Hamun, are 3500 feet above the sea, and although fertile in the south-east, it assumes the character of a wide salt-desert towards the Caspian Sea. There it joins the plateau of Armenia, bounded on the north by the Anti-Caucasus, and in the south by the Kurdistan Mountains. The great salt lakes Van and Urmia have their levels at altitudes of more than 5000 feet; and Mount Ararat, which rises on the plateau, reaches a height of 16,969 feet. Farther west, the plateau of Armenia meets that of Asia Minor, all three together making a wide plateau, elongated towards the north-west, and having a length of 2700 miles, and a width of from 700 to 180 miles. Several chains of mountains running NE. and NW., and reaching more than 10,000 feet in their loftiest summits, intersect the plateau of Asia Minor, which is bordered by the Taurus Mountains on its Mediterranean coasts, and the Pontic Mountains on the Black Sea shore.

(5) *Separate Chains of Mountains.*—The hilly tracts of Asia are not confined to the plateaus and their border-ridges. The Caucasus, an immense wall of snow-clad mountains, stretches NW. to SE. for nearly 800 miles along the border of the Armenian plateau, from which it is separated by the broad valley of the Kura. It reaches 18,560 feet in the Elborus (Elburz) peak. The Urals, from 2000 to 4000 feet high, which separate Europe from Asia, are a broad belt of hilly tracts, stretching as a whole from north to south. Farther east, the Karatau and the Tarbagatai, as also the Verkhoyansk ridge in the far north, strike off from the alpine tracts which fringe the plateau, and have a direction perpendicular to them; while the Byrranga hills diversify the monotony of the *tundras* of the Taimyr Peninsula. The Yeniseik Mountains, consisting of several chains running SW. to NE., contain rich treasures of gold-dust. Several chains, little known, and some of them volcanic, fill up the peninsula of Kamchatka. A number of parallel chains, 5000 to 7000 feet high—the Ikhuri-ain, the Bureya Mountains, Pribrezhnyi, and Tartar—run from the Gulf of Pechili to the Sea of Okhotsk, and are continued in Sakhalin Island; while other chains having the same direction form an outer submarine wall of Asia in Corea, the Japan Archipelago, and the Kuriles. The Nan-ling, Tayu-ling, and other smaller chains having also the same north-eastern direction, cross South China; and submarine chains belonging to the same system of parallel plaitings of the earth-crust are seen in the islands of Formosa and Loo-choo (Liu-kiu). The Seravak chain of Borneo, continued NE. in the Palawan Islands, as also the mountains of Celebes, have the same direction; while the mountains of Sumatra and Malacca assume the perpendicular north-western direction which prevails in South-western Asia. A range of lofty volcanoes rises steeply from the very depths of the ocean in the islands of the Java Sea. The real orography of Burmah and Siam is yet hardly known.

The interior of the Indian peninsula is again occupied by the wide plateau of the Deccan, having an average height of from 1500 to 3000 feet, bordered

in the west by the Western Ghats (7870 feet high in Nila Ghiri peak) and the Cardaman Mountains, and in the east by the much lower and broader Eastern Ghats. The Pedrotallagalla peak in Ceylon rises 8330 feet high. The immense plateaus of Arabia, covered with sand-deserts interspersed with a few fertile regions, rise to altitudes of from 3500 to 4500 feet, and are intersected by several little-known chains of hills. Their south-eastern border-ridge—the Hadramaut—reaches nearly 7000 feet in its highest summits, and the north-western border-ridges—the Lebanon and Anti-Lebanon—have summits nearly 10,000 feet high; while in the deep valley of the Jordan the Dead Sea is sunk to a level of 1185 feet below that of the ocean.

(6) *Lowlands, Plains.*—The whole of North-western Asia is occupied by an immense lowland—Siberia—which joins in the south the wide Aral-Caspian depression. This lowland, whose level is less than five or six hundred feet, does not reach the outer borders of the above-mentioned alpine regions which fringe the great plateau of East Asia. It is separated from them by a belt of elevated, undulating plains rising to a level of from 1000 to 1500 feet, the limits of which may be roughly indicated by a line traced from Merv to Tomsk, and thence to Verkhoyansk. These plains, which assume the character of dry steppes towards the south, are as a whole highly suitable for agriculture and cattle-breeding. Not so the lowlands proper, which bear unmistakable traces of having emerged from the sea during the Post-Pliocene period. In the Aral-Caspian depression they often have the character of sandy deserts, and can be cultivated only where there is a belt of fertile Loess (q.v.) at the base of the mountains, and the streams issuing from the hilly regions yield sufficient water for irrigation. On the northern coast of the Caspian, the Aral-Caspian depression descends even below the level of the sea; while the dry plateau of Ust Urt rises to an average height of about 1000 feet above the sea. The southern parts of Western Siberia are a perfect granary, and are rapidly being colonised; but beyond the 56th or 57th degrees of latitude, the lowland assumes the character of marshy forests, almost totally unsuitable for settlements; and farther north, that of a treeless, barren, and ever-frozen tundra. A like belt of elevated plains, succeeded by one of lowland, runs along the great plateau on its south-eastern edge; and those parts of the plains which are covered in China with loess, as also those of Manchuria to the west of the Pribrezhnyi ridge, are the abodes of a dense agricultural population. In the Indo-Chinese Peninsula, the lowlands are limited to Tonkin, Cambodia, and the lower Menam and Irawadi, where they are fertile, but often marshy.

The wide space between the great plateaus of Western and Eastern Asia and that of the Deccan, watered by the Indus and the Ganges, is again an immense lowland, covering no less than 400,000 sq. m., and supplying the means of existence to 125 millions of inhabitants. Its western part suffers much from want of irrigation; but artificial canalisation rapidly conquers the desert (see INDIA). Another wide lowland, Mesopotamia, or the broad valley of the Tigris and Euphrates, was a cradle of civilisation from the remotest antiquity. Finally, the fertile lowlands in the north of the Caucasus are being rapidly colonised by Russian agriculturists.

Rivers.—It is easy to perceive from the above rapid sketch how much the orographical structure of Asia favours the development of very great rivers, whose drainage basins cover immense areas. Only three rivers—the Mississippi, the Amazon, and the Nile—surpass the largest rivers

of Asia, the Yenisei and the Yang-tse-kiang, both as to length and drainage areas; but owing to the scarcity of rain over large parts of Asia, the amount of water carried down by the largest rivers is, as a rule, disproportionately small as compared with American or European rivers. The predominant feature of Asia's hydrography is the existence of very wide areas having no outlet to the sea. On the great plateau of Eastern Asia, the region which has no outlet from the plateau, and whose water does not reach even Lake Aral or the Caspian—the Han-hai and Gobi—covers a surface larger than that of Spain, France, and Germany together. It is watered only by the Tarim, which supplies some irrigation-works in its upper parts, and enters the rapidly drying marshes of Lob-nor. This area is steadily increasing, and since 1862 we have had to add to it the drainage area (as large as England and Wales) of the Kerulei, which empties into Dalai-nor, but no longer reaches the Argui, a tributary of the Amur. The Ulyasutai River and the Tchagan-togoi now no longer reach Lake Balkhash; and the Urungu, which obviously joined the Upper Irtysh at no very remote date, empties into a lake separated from the Black Irtysh by a low isthmus not 5 miles wide. If we add, however, to this already wide area the drainage basins of Lake Balkhash with its tributaries, the Ili and other smaller rivers; the great Lake Aral, with the Syr-daria (Jaxartes) and Amu-daria (Oxus), as also the numerous rivers which flow towards it or its tributaries, but are desiccated by evaporation before reaching them; and finally the Caspian with its tributaries, the Volga, Ural, Kura, and Terek, we find an immense surface of more than 4,000,000 sq. m.—that is, much larger than Europe—which has no outlet to the ocean. Four inland drainage areas more must be added to the above—the plateaus of Iran and Armenia, two separate areas in Arabia, and one in Asia Minor, the whole representing a surface of 5,567,000 sq. m.

The drainage area of the Arctic Ocean comes next. It includes all the lowlands of Siberia, its plains, and large portions of the great plateau. The chief rivers flowing north to the Arctic Ocean are the Obi, with the Irtysh; the Yenisei, with its great tributary the Angara, which brings to it the waters of Lake Baikal, itself fed by the Selenga, the Upper Angara, and hundreds of small streams; and finally the Lena, with its great tributaries, the Vitim, Olekma, Vilui, and Aldan. Owing to their great tributaries, and still more to the fact that each of them is formed by two great rivers of nearly equal importance, they permit navigation to be carried on, not only north and south, but also west and east, over wide distances in Siberia (q.v.).

Three great rivers enter the Pacific, and all three are navigable for thousands of miles: the Amur, composed of the Argui and Shilka, and receiving the Sungari—a great artery of navigation in Manchuria—the Usuri, and the Zeya; the Hoang-ho; and the Yang-tse-kiang, the last two taking their rise on the plateau of Tibet. They permit freighted boats to penetrate from the seacoast to the very heart of China. The Cambodia or Me-khong, the Salween, and the Irawadi, rising in the eastern parts of the high plateau, water the Indo-Chinese Peninsula. Rising on the same height, the Indus and the Brahmaputra flow through a high valley in opposite directions along the northern base of the Himalayas, until both pierce the gigantic ridge at its opposite ends, and find their way—the former to the lowlands of the Punjab, where it is joined by the Sutlej, and the latter to Assam and Bengal, where it joins the great river of India, the Ganges, before entering the Gulf of Bengal by a great number of branches forming an immense delta. The plateau of the Deccan is

watered by the Godavari and Krishna, flowing east, the Nerbada, flowing west, and a great number of smaller streams. The Tigris and Euphrates, both rising in the high plateau of Armenia, flow parallel to each other, bringing life to the valley of Mesopotamia, and join before entering the Persian Gulf. Arabia Proper has no rivers worthy of notice; only the *waddys*, or dry channels of former rivers, show that there was a time, not far distant, when it was well watered. The Irmah, which enters the Black Sea, is the only river worthy of notice in Asia Minor. In Caucasus, the Rion and Kuba enter the Black Sea, and the Kura and Terek the Caspian.

Inland Seas, Lakes.—Numberless lakes are scattered all over Asia. A succession of great lakes, or rather inland seas, are situated all along the northern slope of the high plateaus of Western and Eastern Asia, their levels becoming higher as we advance farther east. The Caspian, 800 miles long and 270 wide, is an immense sea, much larger than the Black Sea, but its level is now 85 feet below the level of the ocean; Lake Aral, nearly as wide as the Aegean Sea, has its level 157 feet above the ocean; farther east we have Lake Balkhash (780 feet), Zaisan (1200 feet), and Lake Baikal (1550 feet). Numberless smaller lakes and ponds, all rapidly drying up, break the surface of the steppes and lowlands of Siberia; while in the north, immense marshes cover the low grounds of Western Siberia. Many large lakes appear on the plateau of Tibet (Tengri-nor, Bakha) and on the high plateau of the Selenga and Vitim (Ubsa-nor, Ikhe-aral, Kosogol, Oron); and smaller lakes and ponds are so numerous that maps on a large scale are literally dotted with them. The same is true with regard to the plateau of the Deccan, Armenia, and Asia Minor. Three large lakes, Urmia, Van, and Goktcha, and many smaller ones, lie on the highest part of the Armenian plateau. On the Pacific slope of the great plateau, the great rivers of China and the Amur with its tributaries have along their lower courses some large and very many small lakes, which seem like reservoirs where the immense quantities of water carried down by these rivers during the summer rains is stored. The lakes Tun-ting, Po-yang, and Tai-hu, along the Yang-tse-kiang; those along the former course of the lower Hoang-ho; and Lakes Kizi and Hang-ka on the Amur and Usuri, as well as numberless smaller lakes, fall under this category.

Geology.—The time has not yet come when the geological history of Asia can be written in full. It appears, however, that the great plateaus, built up of crystalline unstratified rocks, granites, granites, syenites, and diorites, as well as of gneisses, talc, and mica-schists, clay-slates and limestones, which all belong to the Archæan formation (Huronian, Laurentian, Silurian, and partly Devonian), have not been submerged by the sea since the Devonian epoch. The higher terrace of the plateau of Pamir and the plateaus of the Selenga and Vitim are built up only of Huronian and Laurentian azoic schists; and even Silurian deposits—widely spread on the plains—are doubtful on the plateaus. Their upheaval dates from an earlier age, and they rose above the sea during the Devonian epoch, while parts, at least, of the lower terrace were under the sea at that period. During the Jurassic period, immense fresh-water basins covered the surface of those plateaus, and have left their traces in Jurassic coal-beds, which are found as well in the depressions of the plateaus as in those of the lowlands. Carboniferous deposits are met with in Turkestan, India, and Western Asia; while in Eastern Asia the numerous coal-beds of Manchuria, China, and the archipelagoes are all Jurassic. During the Cretaceous

and Tertiary period an immense mediterranean sea spread over the surface of the plateau, and penetrating through the Zungarian trench, it covered the Han-hai. This interior sea persisted until the earlier parts of the Tertiary epoch, when new upheavals broke its connection with the Tertiary seas which covered what are now plains and lowlands. Thick layers of Tertiary deposits, but mostly having the characters of coast deposits (conglomerates), are found at great heights in the alpine tracts which fringe the plateau. These chains of mountains are of the same ancient geological origin. They rose above the Carboniferous, Triassic, Chalk, and Jurassic seas which covered what are now the lowlands and lower terraces of Asia; but their upheaval has continued throughout these epochs, so that in the outer chains of Asia we see Carboniferous and younger deposits, up to Tertiary, lifted to great heights. It appears, however, that while the ancient upheavals dating from the azoic epoch had chiefly the direction from south-west to north-east, and were mainly due to granites, granitites, and syenites, the more recent upheavals of the Tertiary period have had a direction from north-west to south-east, and were due to augitic rocks, diorites, melaphyres, and so on. They modified, of course, to a great extent the *relief* of Asia, and raised to immense heights the Tertiary deposits, especially in the Himalayas.

What are now the lowlands of Asia must have been widely submerged by the seas of the Tertiary period, as also those of the Quaternary (postpliocene) period. The Tertiary sea of Eastern Asia was broken by chains of mountains into many separate parts, straits and lagoons, while that of Western Asia extended widely over what is now Southern Russia. The sea of the Quaternary period (glacial and post-glacial) no longer reached the plains of Central Asia, nor even the higher plains of Siberia. It covered the whole of the lowlands of North-western Siberia, as far as the 50th degree of latitude, a broad gulf probably connecting the Arctic Ocean with the Aral-Caspian Sea; but there are no traces of it on the high plains of Eastern Siberia, which were only intersected by several narrow elongated gulfs of the ocean. The moistness that thus ensued permitted glaciers (which are wanting now throughout the middle parts of Eastern Siberia and Mongolia) freely to accumulate, so that the whole of the upper plateau and its border-ridges were under a mighty ice-cap. Immense glaciers, like those of the Alps and Jura, covered also the alpine regions. How far glaciation extended over the plateau of Tibet and in China still remains unsettled. In Turkestan and Siberia, immense accumulations of loess fringe the alpine regions; while in China they cover immense tracts, and are the most fertile regions of Asia.

Many important changes in the distribution of land and water have been going on in Asia since the glacial period, and even during historic times. Since the Aral-Caspian Sea became isolated from the ocean, its desiccation, as well as that of the numberless lakes which dotted the surface of Asia during the Lacustrine (post-glacial) period, has proceeded with a rapidity which may be guessed from the very rapid rate at which the process has been observed to go on in Siberia during the last hundred years. All Asia bears unmistakable traces of having been covered during the Lacustrine period with numberless large and small lakes, which have now disappeared, not in consequence of the action of man, but in consequence of some general causes affecting the earth's surface since the last glacial period. The process is still more accelerated by the rapid upheaval of the continent—the whole of the

Arctic coast, as also most of that washed by the Pacific, the Mediterranean, the Red Sea, and parts of the Indian Ocean, being in a state of gradual elevation, while the few areas where traces of subsidence have been noticed are very limited. The influence of the desiccation of Asia has been felt even during historic times, and the migrations of the Ural-Altaians, Turks, and Mongols will probably be best explained if this change in the condition of Central Asia be taken into account; while the same circumstance explains the nearly desert state of those regions which were the cradle of European civilisation.

Volcanoes play an important part in Asia's geology; more than 120 active volcanoes are known in Asia, chiefly in the islands of the south-east, the Philippines, Japan, the Kuriles, and Kamchatka, and also in a few islands of the Sea of Bengal and Arabia, and of Western Asia. Numerous traces of volcanic eruptions are found, not only in the same regions, but also in Eastern Tian-shan, in the north-western border-ridges of the high Siberian plateau, and in the south-west of Aigun in Manchuria. Earthquakes are frequent, especially in Armenia, Turkestan, and around Lake Baikal.

Minerals.—Asia is exceedingly rich in a great variety of mineral products. There are gold mines of great wealth in the Urals, the Altai, and Eastern Siberia; and auriferous sands are found in Corea, Sumatra, Japan, and in the Caucasus Mountains. Silver is extracted in Siberia; platina in the Urals; copper in Japan, India, and Siberia; tin in Banca; mercury in Japan. Iron ore is found in nearly all the mountainous regions, especially in Asia Minor, Persia, Turkestan, India, China, Japan, and Siberia; but iron mining is still at a rudimentary stage. Immense coal-beds are spread over China and the islands of the Pacific (Hainan, Japanese Archipelago, Sakhalin), Eastern Siberia, Turkestan, India, Persia, and Asia Minor. They cover no less than half a million square miles in China alone; but the extraction of coal is as yet very limited. Graphite of very high quality is found in the Sayans and Northern Siberia. The diamonds of India, the sapphires of Ceylon, the rubies of Burmah and Turkestan, the topazes, beryls, &c. of the Urals and Nertchinsk, have a wide repute. Layers of rock-salt are widely spread, and still more so the salt lakes and springs. The petroleum wells of the Caspian shores already rival those of the United States. Of other mineral products of less value which are used in modern industry, such as manganese, quartz sand, dyeing matters, and the like, there is no lack in Asia; and when modern industry shall spread over the great eastern continent, it will find at hand the best specimens and the greatest variety of mineral products, although it will have to vanquish the obstacles opposed to their extraction by the difficulties of access of the mountain tracts.

A variety of mineral springs, some of them equal to the best waters of Western Europe, are widely spread over Asia. Those of Caucasus and Transbaikalia already attract a number of patients.

Climate.—Even Eastern Europe has quite a continental climate. Still more continental is the climate throughout Asia, with the exception of a part of its coast regions. On account of the immense area of Asia, great differences of climate are met with, and therefore the meteorologists subdivide the continent into several climatic regions. (a) The province of Western Siberia, purely continental, is very cold in the winter and hot in summer. (b) Eastern Siberia is still more continental, colder in winter, and drier; it includes the pole of cold about Verkhoyansk, under 67° 34' N. lat., which

is the coldest spot of the Eastern Hemisphere; each wind, whatever its direction, brings to it a warmer air, and its average yearly temperature is no more than 2° F., while that of January is 56° below the freezing-point of the Fahrenheit scale. See TEMPERATURE (TERRESTRIAL). (c) The Kamchatka province, receiving much more rain than the preceding, is moister and more genial. (d) The Chinese have a cold winter, and receive in the summer the periodical rains due to the monsoons; in Japan the climate is much the same, but more moderate. (e) The Central-Asian plateau is characterised by an exceedingly dry climate, with very cold winters, the cold being increased by its height above the sea-level. (f) The same exceeding dryness of climate is met with in the Aral-Caspian lowland, with its scanty rains and depressingly hot summer; and the same again is true with regard to (g) the Arabian region and Mesopotamia, which together may be considered as an eastern continuation of the Sahara. (h) The Mediterranean region, including Asia Minor, enjoys the best climate, reasonably moist, and more moderate in its extremes of temperature. (i) The valley of the Lower Indus, whose climate is dry and very hot, must be considered as a separate region; while (k) India, the Indo-Chinese Peninsula, and Australasia have a tropical climate, characterised by abundant periodical rains, especially in the summer, and a limited range of temperature. During the winter, Asia, as a whole, with the exception of India, the Indo-Chinese peninsula, and South-western Arabia, enjoys a temperature much lower than that of corresponding latitudes elsewhere; while in July, throughout all Asia, except on the coasts of the Kara Sea, Kamchatka, and the Manchurian littoral, the temperature is higher than under the same latitudes elsewhere.

The extreme cooling of North-eastern Asia during the winter results in a high pressure of air, which flows in January south, south-east, and south-west, resulting in NW., N., and NE. winds in Manchuria, China, India, and South-eastern Europe. In July, the barometrical minima in India, North-eastern Siberia, and Northern Manchuria result in SW. and W. winds on the west coasts of India, and S. and SE. winds in South-eastern Asia, while North-eastern Asia is under ENE., NE., and E. winds.

It may be seen from the above how unequally the rainfall must be distributed over Asia. Thus, the Western Ghats of India, and the western slopes of the Assam Mountains, receive during the year no less than 98 inches of rain, which often falls in torrents. As a rule, the western coasts of India and the Indo-Chinese Peninsula, as also the valley of the Ganges, receive more than 75 inches of rain per year; while immense tracts of the Aral-Caspian depression, the Central-Asian plateau, Arabia, and Persia have less than 10 inches per year (no more than from 2 to 5 inches over Central Asia); and the remainder has from 10 to 25 inches, with between 25 and 50 in Southern Siberia and Manchuria.

Flora.—When the traveller crosses the Urals and enters the lowlands of Western Siberia, he finds but little difference between the vegetation of the east of Europe and that of North-western Asia, and therefore the whole of Siberia, down to the 50th degree of latitude, has been included in one and the same domain of vegetation stretching from Scandinavia to the Pacific, across the northern half of the Old World. Only a narrow strip of land along the shores of the Arctic Ocean, where tree vegetation is represented only by two species of dwarf willows, 2 or 3 inches high, and by shrubs of the dwarf birch, is considered as a separate region—that of the *tundra* region, which extends

from the White Sea to the north-eastern extremity of Asia. It is the true domain of lichens and mosses, which clothe the deeply frozen ground; but in the few sheltered places where some soil has accumulated, we find hundreds of our common European flowering plants. The remainder of Siberia is included in the European-Asiatic boreal domain. Forests cover these extensive tracts, both in the hilly districts and in the marshy lowlands of Western Siberia, and they consist of the same trees (pine, fir, larch, cedar, silver-fir, birch, aspen, and poplars) with which we are familiar in Europe. Only the red beech, which even in Middle Europe does not advance farther east than Poland, does not penetrate into Siberia; and the oak does not cross the Ural, reappearing only on the south-eastern slope of the great plateau. Besides, some conifers (larch, fir) show slight differences from their European congeners, which permit us to treat them as separate species. Nevertheless, the forests of Siberia differ widely from those of Europe in the predominance of the larch, the rarity of the Scotch fir, which grows only on the drier ground, and the very characters of the trees, compelled to accommodate themselves to a harsh climate, and to a soil either stony or swampy. The underwood of the Siberian forests also offers a richer variety of species, and many a bush, now a favourite in our gardens for its wealth of blossom (*Pirus baccata*, *Robinia caragana*, *Lonicera tatarica* and *cœrulea*, *Clematis*, *Rhododendron*), has its home in the alpine tracts which border the great plateau on the north-west. On the meadows which cover immense areas both on the lowlands and high plains, the vegetation, as a whole, differs but slightly from that of Eastern Europe; but it has a very different appearance, on account of the immense size reached by many grasses with hard, woody stems, and the brilliancy of their showy flowers. Peonies, aconites, gentians, asters, and the like, in the spring-time impart such a brightness to the meadows of the Baraba Steppe in Western Siberia, and still more of the high plains of Minusinsk and Transbaikalia, as makes our European meadows appear exceedingly tame in comparison with those of Siberia. Corn grows freely throughout the region, except in places having a great altitude, where early frosts destroy the crops. Barley is cultivated even at Yakutsk, where it ripens rapidly during the hot summer, and under the greater amount of light received in these high latitudes. But fruit-trees, although they blossom every year, yield no fruits; the late May frosts nip their blossom.

This wide vegetation-region, which occupies all Northern Asia, is bounded on the south by a line traced roughly from the Black Sea to Lake Baikal, and thence to the Upper Amur and the Sea of Okhotsk. It has not, however, the uniformity it may be supposed to have from a glance at a geo-botanic map. While the species freely spread from west to east on the lowlands of Siberia, they spread quite as easily from south-west to north-east, both along the high plains and the alpine regions which border the high plateau in the north-west, and over the plateau itself. Therefore, even the Siberian flora is easily subdivided into several separate regions. Thus we see the cedar-tree spreading all along the highest parts of the north-west border-ridge of the high plateau, from the Altai to the Lena; we find the same vegetation on the high plateau of the Kosogol and on the Vitim; the vegetation of the high plains of the Altai offers features common to that of the high plains west of Lake Baikal; and the Transbaikalian flora partakes of the characters of the Gobi. As soon as the Amur issues from the high plateau, we find on its banks the Chinese

and Japanese flora under the same latitudes as the purely Siberian flora in the west. Finally, it appears from recent investigations that even about Lake Balkhash and at the foot of the Tian-shan we have remainders of a European-Siberian flora, which has maintained itself on the better-watered slopes.

The next vegetation zone marked on our maps is that of the Steppes, which extends from the Steppes of South-eastern Russia over the Aral-Caspian depression and the middle parts of the high plateaus of Western and Eastern Asia, including several separate desert-regions (the Han-hai, the Gobi, the dry interior parts of Arabia, Persia, and North-western India). This wide region ought to be divided in Central Asia alone into at least four sub-regions: the Aral-Caspian, the Tian-Shan, the Tibetan, and the Mongolian floras. The excessive dryness of climate gives to this region its characteristic aspect. Tree vegetation maintains itself only on the snow-covered mountains, which supply enough of moisture to the soil, while on the drier southern slopes, the Steppe vegetation climbs up to the limits of perennial snow. Only those bushes prosper which, like the Archa (*Juniperus pseudo-sabina*) and Saksaul (*Anabasis ammodendron*), have hardly any leaves, giving a dreary aspect to the Aral-Caspian Steppes and the base of the Tian-shan Mountains. The Steppes, the surface of the high plateau, and even (during the spring) the dry deserts, are covered with a rich carpet of nutritious grass. The grass of the Steppes is reduced to a few species—*Festuca*, *Stipa*, *Artemisia*, *Sal-solacea*. In the dry regions of Arabia, the flora assumes a decidedly African character, owing to the presence of the gum-acacia and the date-palm.

The flora of the region to the east of the high plateau, including China, Manchuria, and Japan, must be considered as an East-Asiatic equivalent for the Mediterranean fauna of Europe. Oak reappears as soon as the eastern border-ridge of the plateau is crossed. So also the walnut, the hazel, the lime-tree, the maple; while several new species of poplars, willows, acacias, and many others, make their appearance. The forests, consisting of a most mixed vegetation, where southern species meet with northern ones, become really beautiful; in Japan a variety of species of pine, and the reappearance of the beech, add to their beauty. A rich underwood of lianas, ivies, wild vines, roses, and so on, renders the forests quite impassable, especially in the littoral region, which is submitted to the influence of the monsoons. In the lower parts, rich prairies cover immense spaces; the grass vegetation becomes luxuriant; and in the virgin prairies of the Amur, man and horse are easily concealed by the stems of grasses of gigantic size. Rice and cotton are cultivated in the southern parts of the region. The gradual disappearance of the southern species, and the prevalence of northern ones, permits the division of the region into two parts: the Chinese flora, and that of Manchuria and the Okhotsk littoral.

In Western Asia, the rich vegetation of the moister parts of Caucasus and the southern shores of the Caspian belongs to the Mediterranean flora of Europe. The beech is characteristic of the forests of this district, which besides contain all the trees of Southern Europe. The vine and several of our European fruit-trees (plum, cherry, apricot, pear) are regarded by botanists as belonging originally to this region. The flora of Asia Minor combines those of Southern Europe and Northern Africa, owing to its evergreen oaks, laurels, olive-trees, myrtles, oleanders, and pistachio-trees, as also to its variety of bulbous plants.

Southern and South-Eastern Asia, with their

numerous islands, display the richest flora, which seems quite distinct from the above, and extends as a separate domain of vegetation over India, the Indo-Chinese Peninsula, and the archipelagos, and (according to Drude) reaches North-western Australia. The hot climate, and the great amount of the summer rains, with a relatively dry winter, contribute to the development of a rich tropical vegetation. Thanks to the moisture of climate, the higher parts of the region, particularly the Himalayas, are clothed on their southern slopes with forests up to heights of 12,000 and 13,000 feet. The vegetation of the higher hilly tracts is very like the European. Numbers of plants growing on the Himalayan summits are common to all Arctic regions, showing thus the unity of flora of the Old World at its issue from the glacial period. Lower down, in the forest-girdle, pines, Scotch fir, juniper, and yew-trees are quite like their European congeners. The Indian cedar or 'deodar' yields an excellent timber, while in the underwood a remarkable variety of rhododendrons, growing sometimes 90 feet high, at heights about 8000 feet above the sea, are noteworthy.

In the lower parts of the region, and especially the neighbourhood of the seacoasts, the tropical vegetation reaches the variety and size of the American. Here the sugar-cane, the cotton-shrub, and the indigo had their origin. The cocoa-nut palm and the banyan-tree are the most striking feature of the coast vegetation. Ferns reach the size of large trees. The gigantic banyan, under whose branches hundreds of men can find a shelter, the screw-pine (*Pandanus*), the indiarubber, and the red cotton trees grow in immense forests; and bamboos grow thick and high.

In Borneo, Java, and the islands of the archipelagos, the tropical vegetation is, in its broad features, the same as in India. The mountain-flora also is like that of the Himalayas; rich forests clothe the volcanoes up to their tops. The sago-palm, the bread-tree, imported from the South Sea Islands, and the tamarind, also imported, are largely cultivated, as also the cocoa-nut palm and the sugar-palm. Orchids appear in their full variety and beauty. The swamps are covered with mangroves, or with the anomalous-looking Nipa or Sasa-palm; and vanilla, pepper, clove, and nearly all the spices are native to this region.

It is easy to see from the above what a variety of useful plants Asia has given to Europe. Wheat, barley, oats, and millet come from Western Asia; so also onions, radishes, peas, beans, spinach, and several other vegetables of our kitchen-gardens. Nearly all our fruit-trees have the same origin. The apple, pear, plum, cherry, almond, pistachio, and mulberry-tree were first cultivated in Asia; the raspberry and even lucerne have been imported from Asia to Europe.

Fauna.—The fauna of nearly the whole of continental Asia is considered by zoologists as belonging to one single domain—that of Northern and Central Asia; and the immensity of this zoogeographical region is easily accounted for by the ease with which animals could spread over the plains of Europe and Siberia on the one side, and on the other, along the high plateau which stretches from Tibet to the land of the Tchukchis. But this wide region can be easily subdivided into the Arctic region, which shares its characters with Arctic regions generally; the boreal, embracing the lowlands of Western Siberia; the Daurian, in the northern parts of the great plateau; and the Central Asian. The fauna of Siberia is much like that of Eastern Europe, and would be still more like, were it not for the disappearance from Europe of several species still existing in Siberia. It is the true habitat of all

fur-bearing animals, as the bear, wolf, fox, sable, ermine, otter, beaver, common weasel, and squirrel; as also of the hare, the wild boar, the stag, the reindeer, and the elk, all belonging to the European faunas, with the addition of several species common to the Arctic fauna. In Eastern Siberia, however—i.e. in the northern parts of the high plateau—we find representatives of the fauna of Central Asia, which spread from the south-west (see SIBERIA). A further addition of Mongolian species is found on the lower plateau in Transbaikalia, where the fauna of the Central-Asian depression meets with that of Siberia.

The Central-Asian plateau has a fauna of its own; we find there the wild ancestors of several of our domestic animals—viz. the wild horse (*Equus Przewalski*), discovered by Przewalski (Prejevalsky) in the Ala-shan Mountains, the wild camel and donkey, and the *Capra egargus*, from which our common goat is descended. The yak, several species of antelopes, and the roebuck are characteristic of the Central-Asian fauna; so also are the huge sheep (*Ovis argali* and *Ovis polii*), now disappearing, which found refuge in the wilder parts of the plateau. In the Steppe region we find the same fauna as in Siberia, with the addition of the tiger, which occasionally reaches Lake Zaisan, and even Lake Baikal; the leopard and hyena, coming from warmer regions; and a variety of endemic birds; while in Arabia there is an admixture of African species.

The fauna of mammals in China, Manchuria, and Japan differs but little from the Siberian. The difference is mainly notable with regard to the birds, among which the pheasants are richly represented. Several Indian species also penetrate within this region. The Caucasus has a fauna belonging to the Circum-Mediterranean region, and it is worthy of notice that the bison, which has now completely disappeared from Europe (with the exception of the Byelovyezh forests in Western Russia), is still found in the forests of Caucasus; there we find also the same abundance of pheasants as on the Pacific littoral. The fauna of Asia Minor unquestionably belongs to the Circum-Mediterranean region, and includes representatives of the warm zone—viz. small apes, which spread from Africa into Persia, the porcupine of Southern Europe, and the Genet (q.v.).

Southern and South-eastern Asia belong to a separate zoological domain. The heights of the Himalayas have the fauna of the Tibet portion of the high plateau; but on their southern slopes the fauna is purely Indian and Transgangeitic, while a few African species are found on the plains of India and in the Deccan. As a whole, the tropical fauna of Asia is richer than the African, and the American tropical fauna surpasses it only in the number of parrots and the family of Picariæ. It is characterised by the great number of carnivora, which find ready refuge in the jungles, and by the elephant, rhinoceros, wild buffalo, red deer, many long-armed apes and half-apes, vampires, genets, and a variety of serpents and crocodiles; while the bird fauna includes vultures, a variety of parrots, pelicans, and flamingoes. The fauna is still richer in the Indo-Chinese Peninsula, while in the archipelagos of South-eastern Asia several Australian species add to its extent.

The fauna of Asia, as of Europe, has undergone notable changes since the glacial period. The mammoth and hairy rhinoceros have disappeared, and their skeletons are buried in innumerable quantities in the great glacial deposits. So also the cave-bear, tiger, wolf, and hyena. Even within historic times, several species of mammals, like the bison and the aurochs, have all but disappeared, while others are found only in

very small numbers in the wildest parts of the high plateau.

Ethnography.—The aggregate population of Asia is estimated at 835 millions, being thus more than one-half of the entire population of the globe. In comparison with the total area of Asia, this population is nevertheless small, giving only an average of 49 inhabitants per sq. m. It is, however, very unequally distributed, and reaches 557 per sq. m. in some provinces of China—denser than in Belgium (514 per sq. m.)—and 470 in some parts of North-western India. As a rule, it is greatest in those parts of Asia which are most favoured by rains, the densest population being met with to the south and south-east of the great plateau, on an area comprising only one-fifth of Asia's surface. Seventenths have scarcely more than from 3 to 20 inhabitants per sq. m.; and nearly one-tenth is almost quite uninhabited.

Having been inhabited by man since the earliest period of the stone age, and having been moreover the theatre of so many migrations, Asia has but few human races free from mixture with other races. Nevertheless, the hindrance to mutual intercourse opposed by its mountains, and still more by its high plateaus and deserts, prevented the mingling of races and stems to such an extent as in Europe; therefore we find now in Asia the greatest variety of ethnological types and languages. And distinct stems in the less accessible tracts, numbering now but a few families, are sometimes the last remainders of great races. The work of classifying the immense variety of stocks inhabiting Asia according to their ethnological affinities and origin is being busily prosecuted by ethnographers and philologists, but is as yet far from being terminated.

The inhabitants of Asia belong to five different groups: the so-called Caucasian (Fair type) in Western Asia and India; the Mongolian in Central and Eastern Asia, as also in the Indo-Chinese Peninsula; the Malay in Malacca and the Indian Archipelago; the Dravids in South-eastern India and Ceylon; and the Negritos and Papuas in the virgin forests of the Philippine Islands and Celebes. A sixth great division, comprising the stems which inhabit North-eastern Asia—the Hyperboreans—whose affinities are not yet well known, must be added to the above. The Mongolian race alone embraces nearly seven-tenths of the population of Asia; the Malay, about two-tenths; and the Caucasian about one-tenth. The Europeans reckon about six millions (Russians) in Caucasus, Turkestan, and Siberia; some 150,000 (English) in India; and 45,000 in the Dutch Indies.

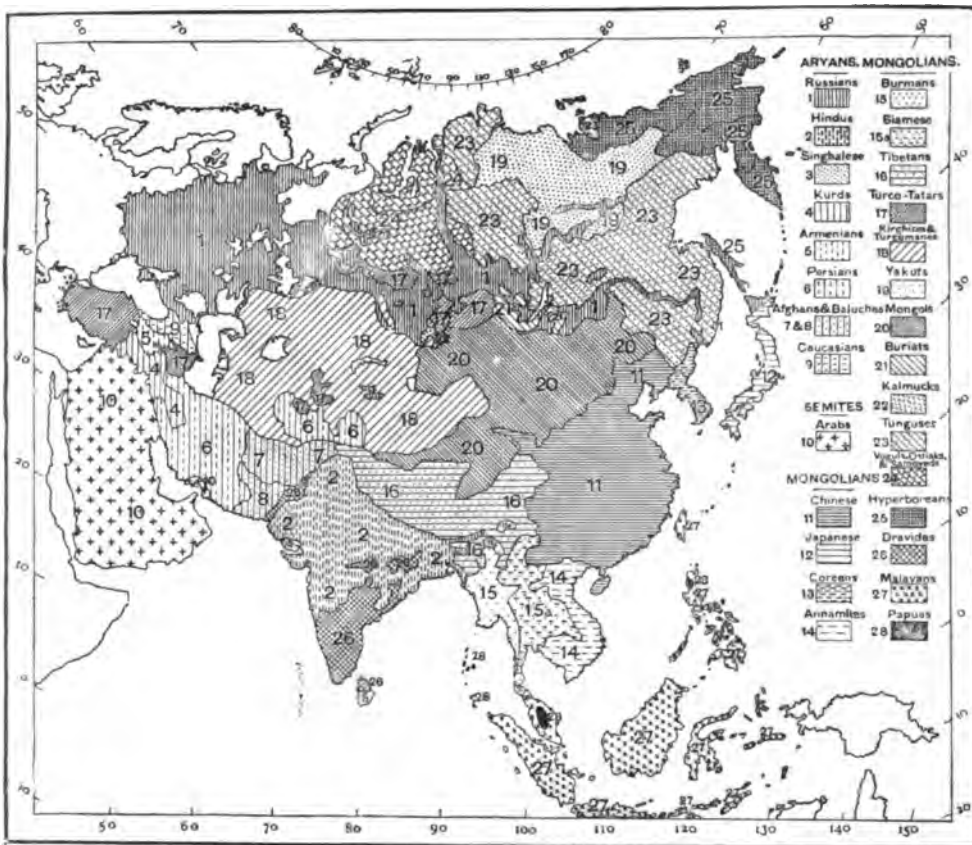

The further subdivision of the inhabitants of Asia, according to language, is as follows: The Caucasian race embraces (1) tribes and stems in Caucasus (Georgians, Lezghians, Circassians, &c.); (2) the Semitic branch, partly mixed with others, and subdivided into northern and southern; it comprises the Jews and the Arabs, who spread over Arabia, Mesopotamia, Syria, and partly over Africa; and (3) the Indo-Germanic branch, containing: (a) the Indians, whose language has, besides the Hindi, spoken in Central India, several dialects spoken in Kashmir and Punjab, the Hindustani or Urdu, the Sindhi, the Marathi, the Bengali, and Assami; and (b) the Iranians (Persians, Tajiks, and Zendo-Afghans, as also the Kurds, the Armenians, and Ossetians). To these must be added the Russians and other Europeans.

The Mongolian race (Yellow type) is represented by four great branches, each of which comprises a great variety of stems (some very numerous, others composed only of rapidly disappearing tribes). These are: (1) the Ural-Altaians, or Finno-Tartars, subdivided in their turn into (a) the Samoyedic

tribes; (b) the Finnish stems; (c) the Turco-Tartars (Turks, Turcomans, Yakuts, Nogais, Dagatais, Uigur-Turks, and Kirghizes); (d) the Mongols, including the Mongols proper, the Buriats, and the Kalmucks; and (e) the Manchurians and Tunguses. The two other great branches belonging to the same subdivision of polysyllabic peoples are (2) the Japanese, and (3) the Koreans; while a fourth great branch includes (4) the nations speaking monosyllabic languages, namely: (a) the Chinese; (b) the Tibetans; (c) the Himalayan tribes; (d) the Burmese; (e) the Siamese; (f) the Annamese; and (g) the Sifars, Miautse, and several others.

The Hyperboreans, whose origin is not yet sufficiently known, are considered as quite separate from the above. They include: (1) the Yukaghirs, (2) the Tchukchis, and (3) the Koryaks and Kamchadales—all inhabiting the extreme north-east of Asia; and (4) the Ainors or Kurilians. The Yenisei Ostiaks and the Kottas are reckoned to belong to the same stock (see SIBERIA).

The Dravidian race, which formerly peopled all India, is now reduced to the mountain tracts of the interior and to Southern India, and is represented by (1) the Dravidas proper, including the Tamuls, Telingas, Canarese, and other smaller

Ethnographical Map of Asia.

stems; (2) the Kolarian tribes; and (3) the Singalese, whose language—the Elu—must be considered, however, as quite separate.

The Malay race has three chief subdivisions: (1) the Malays proper; (2) the Polynesians; and (3) the Melanesians, who are a mixture of Malays with Papuas. All three are subdivided into a number of separate tribes (see MALAYS). The Negritos and Papuas are now found only in the less accessible forests of the interior of the peninsula of Malacca, and on the Philippine and Andaman Islands.

Religions.—Since the dawn of history, Asia has been the birthplace of religions which spread all over the continent and the other parts of the world. The four great religions which are professed by the great majority of mankind—the Jewish, Buddhist,

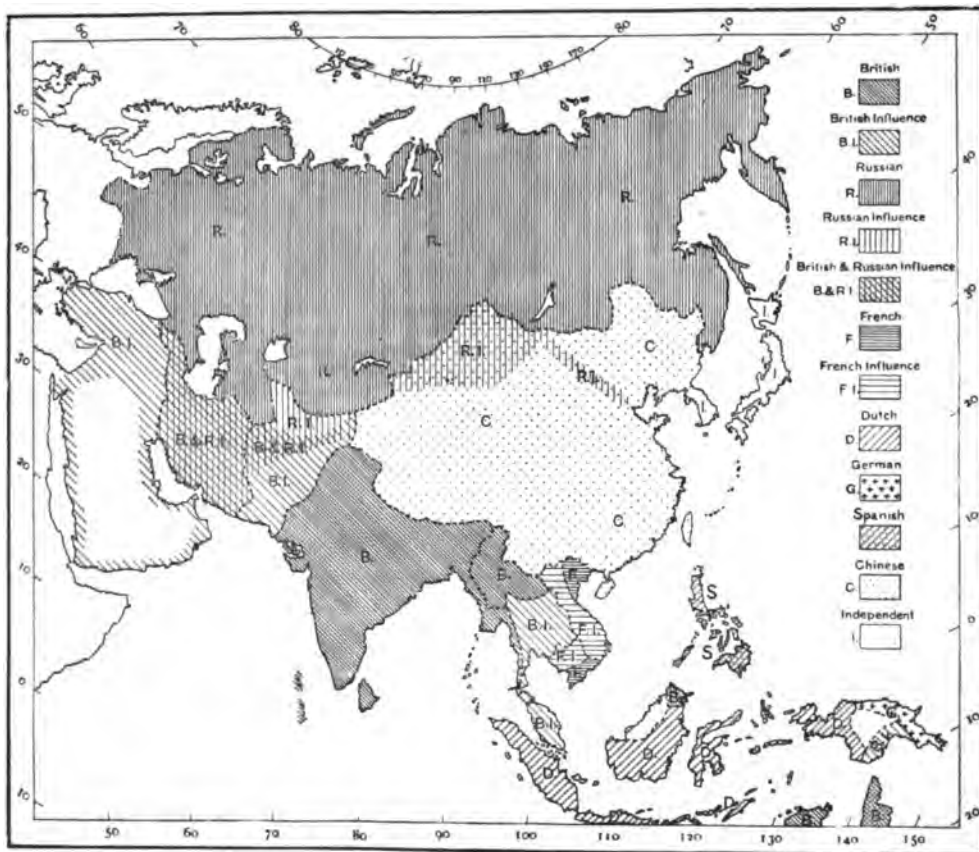

Christian, and Mohanmedan—had their origin in Asia, where they grew up under the influence of still older religions—the Babylonian and that of Zoroaster—both also of Asiatic origin. Multitudes of new sects, or religions, mingled together, and exercising influence upon one another, are continually growing on the soil of Asia. At present the inhabitants of Asia belong chiefly to the Buddhist religion, which—inclusive of the followers of Lamaism, the moral philosophy of Confucius, and the teachings of Lao-tse, who all accept more or less the Buddhist ritual—has no less than 530 to 560 millions of followers—i.e. nearly one-third of mankind. The old faith of Hinduism has no less than 187 millions of followers in India. Most of the inhabitants of Western Asia, as also of part of Central Asia, follow the religion of

Islam; they may number about 90 millions. The Christians number about 20 millions in Armenia, Caucasus, Siberia, and Turkestan. Many of the Ural-Altaians continue to maintain their ancient faith—Shamanism—though a number of them are nominal followers of the Buddhist or Christian religions. Jews are scattered mostly in Western and Central Asia. A few fire-worshippers—Guebres or Parsi—who are found in the west of India and Persia are the sole remnant of the once wide-spread religion of Zoroaster; while vestiges of Sabæism are found amidst the Gesides and Sabians on the Tigris.

Civilisation.—Together with Egypt, Asia was the cradle of the present European civilisation; but, owing to many circumstances, partly physical and partly historical, the development of Asia proceeded on independent lines, and, as a whole, it may be considered as behind the civilisation of Europe. The current of civilisation, which formerly moved from Asia to Europe, returns now from west to east—unhappily, too often in its worst shape, that of conquest. Many a civilisation which grew up, either in South-western Asia or on the northern slope of the great plateau, has been swept away by invasions of less civilised half-nomads. At present one finds in Asia all varieties

of civilisation—the primitive tribes of North-eastern Siberia, the confederations of nomadic shepherds, and great nations in possession of a common stock of national customs, beliefs, and literature, like China; the tribal stage; the 'compound family,' forming the real basis of China's social organisation; the rural community, both of the Indian (also East European) and Mussulman type; the loose aggregations of Tchuktschis, having no rulers, and no religion beyond the worship of forces of nature, but professing with regard to one another principles of morality and mutual support often forgotten in higher stages of civilisation; and despotic monarchies, with a powerful clergy. So also in economic life. While the tribes of the north-east find their means of subsistence exclusively in fishing and hunting carried on with the simplest implements, among which stone weapons have not yet quite disappeared, and the tribes of Central Asia carry on primitive cattle-breeding and lead a half-nomadic life, others are agriculturists, and have brought irrigation (in Turkestan) to a degree of perfection hardly known in Europe.

Political Conditions.—Viewed in its broad features, universal history appears as a long record of the mutual intercourse of Asia and Europe,

Distribution of the Continent amongst the Great Asiatic Powers.

and of struggle between them. While the countries beyond the great plateau entered but quite recently within the domain of western history, those on its Mediterranean slope have never ceased

to exercise a powerful influence on Europe. At the very dawn of written history—that is, forty centuries before our era—the great Accadian empire already influenced the inhabitants of the coasts of

the Mediterranean. Later on, the Phœnicians extended their authority over Northern Africa and the Egean Sea; the Persians modified the development of Egypt; and at a very remote epoch, the date of which cannot be yet ascertained, an oasis of high civilisation, grown up at the base of the Altai Mountains, spread itself to the west over Northern Europe. On the other hand, as soon as Greece, which had borrowed her civilisation from Asia, brought it to so high a pitch as to become the cradle of European culture, she tried to extend her rule over the decaying empires of Western Asia. Alexander of Macedon pushed his conquests as far as Turkestan; and later on, Rome conquered Western Asia. But the Greek and Arabian civilisation in Central Asia decayed under the raids of Mongolian tribes; the Roman empire was absorbed by the East, and fell into decay at the very confines of Asia, on the shores of the Bosphorus; the Arsacides and Sassanides of Persia repulsed the Roman aggression and conquered Roman provinces, while it was to mass movements from Asia into Europe that the great migrations of the first centuries of our era were due. Ural-Altaians migrated to the Urals, and thence to Hungary. Other Turanians—the Mervs, the Alans, the Avars—penetrated into Europe from the south-east; Mongols abandoned their rapidly desiccating plateaus, and invaded the Russian plains; the Arabs, following the south coast of the Mediterranean, invaded Spain; and the empire of the Osmanlis arose on the ruins of the Eastern Roman empire. By these invasions, Asia arrested the free development of Europe, and compelled the Germanic, Gallic, and Slavonic federations to gather into powerful states of the Roman monarchical type.

A new epoch in European history began after the development of European navigation, when Portuguese ships, rounding the Cape, founded the first European colonies in India. They were soon followed by the Spaniards, the Dutch, the French, the Danes, and the British, all endeavouring to seize the richest colonies in Asia, and all involved in interminable struggles for preponderance in her lands and on her seas; while Russia, in the course of a few centuries, conquered and partly colonised the best parts of the immense cold prairies and forest-lands on the north-western slope of the high plateau, and crossing its narrow extremity in the north-east, reached the Pacific. Great Britain established herself in India, and expelling thence her competitors from all but a few spots on the sea-coast, she took possession of the whole of the peninsula, and extended her powers over the western parts of the Indo-Chinese Peninsula. The Portuguese retain in India only Diu, Daman, and Goa; and the French keep Chandernagore, Yanaon, Pondicherry, Carical, and Mahé. The next colonial power in Asia is the Dutch, who have under their dominion most of Borneo, Sumatra, Java, Celebes, the Moluccas, and the small Sunda Islands. British and French interests are rivals in the Indo-Chinese Peninsula, and while Burmah has become English, the recent annexation of a part of Tonkin by France permits her to extend her influence in Annam. Finally, several islands of the South-east Archipelago belong to Spain. Leaving out these relatively small colonies, three great powers, Great Britain, Russia, and China, are the real masters of Asia, the last-named eastern empire opposing, by the number and cohesion of its inhabitants, a powerful resistance to the encroachments of European powers on its territory, and promising to become a formidable power, which may some day exercise a great influence on the destinies of mankind.

The chief political divisions of Asia, with their approximate areas and population (mostly

estimated) appear as follows. The territories belonging to European powers, or protected by them, are distinguished by abbreviations:

	Area in sq. m.	Population.
RUSSIAN ASIA—		
Caucasus (Russian).....	182,600	6,534,850
Siberia (Russia).....	4,824,570	4,098,500
Transcasian Region (Russia).....	230,400	206,000
Caspian Sea.....	169,670
Turkestan (Russia).....	1,541,500	5,245,000
	6,948,640	16,079,350
WESTERN ASIA—		
Asiatic Turkey.....	729,200	16,138,000
Samos (trib. to Turkey).....	210	41,200
Cyprus (British).....	3,580	188,200
Independent Arabia.....	988,200	3,700,000
Aden and Perim (Brit.).....	70	34,900
	1,701,280	20,095,300
IRAN AND TURAN—		
Persia (Russia and Brit. prot.).....	638,400	7,668,600
Afghanistan (Br. and Russia influence).....	240,000	4,000,000
Kafiristan (Russia and Brit. prot.).....	20,000	1,000,000
Beluchistan (Brit. prot.).....	106,800	850,000
Khiva (Russia prot.).....	22,300	70,000
Bokhara and Karategin (Russia prot.).....	92,300	2,130,000
	1,117,800	15,203,600
INDIA—		
British Territory.....	787,000	196,019,200
Feudatory States (Brit.).....	509,730	55,192,000
Ceylon (Brit.).....	25,360	2,860,000
French Possessions.....	195	232,700
Portuguese Possessions.....	1,605	475,200
Himalaya States (Brit.).....	89,600	3,300,000
	1,413,490	257,119,100
INDO-CHINESE PENINSULA—		
Wild tribes of Assam (Brit. prot.).....	25,200	200,000
Lower Burmah (Brit.).....	277,720	6,736,900
Upper Burmah (Brit.).....	1,450	540,000
Straits Settlements (Brit.).....	230,650	6,000,000
Siam.....	31,500	300,000
Malacca States.....	225,020	24,100,000
Cochin-China (Fr.).....
Tonkin (Fr.).....
Cambodia (Fr. prot.).....
Annam (Fr. prot.).....
	1,042,230	37,876,800
CHINA AND JAPAN—		
China Proper and Manchuria.....	1,660,300	395,000,000
Vassal States (Mongolia, Tibet, Zungaria, Eastern Turkestan).....	2,519,300	9,200,000
Corea (Chin. prot.).....	84,250	10,500,000
Hong-kong (Brit.).....	32	160,400
Macao (Port.).....	28	68,100
Japan.....	148,500	37,899,000
	4,412,410	432,797,500
SOUTH-EASTERN ASIA—		
Dutch East Indies.....	568,900	23,468,000
Philippines, Marianas, Caroline, and Sulu Archipelago (Spain).....	116,200	5,681,000
East Timor, &c. (Port.).....	6,200	300,000
North Borneo and Labuan (Brit.).....	27,530	181,300
Borneo States (Sarawak and Brunei).....	62,940	450,000
	781,920	35,080,300
Total, Asia.....	17,417,750	834,251,950

Produce.—The amount of cereals—rice, millet, wheat, barley, oats, &c.—supplied by the rich corn-fields of China, Indo-China, Japan, and even Turkestan, may be best judged by the density of population in the better-watered parts of these countries, and by the rapidly increasing amounts of corn exported, especially from India; while in Southern Siberia, the Altai, and the Middle Amur, Russian settlers raising wheat, rye, oats, barley, melons, &c. on the virgin soil of the *prairies* enjoy a welfare hardly known in Russia. The crops of cotton in India and Asia Minor helped Europe to meet the cotton crisis of 1863; and those of Bokhara and Transcaucasia gave an impulse to the growing cotton industry of Russia. Tea is the chief crop of Southern China, Assam, India, and Ceylon; and coffee the wealth of Arabia, India, Ceylon, and the Dutch colonies. The silkworm culture is widely spread in Asia Minor, Persia, Turkestan, India, China, and Japan. The sugar-cane is largely raised in Southern and South-

eastern Asia. Oleaginous plants, indigo and other dye plants, jute, spices, the cinchona-tree, and opium-producing plants are extensively cultivated; as also fruit-trees in Western Asia and Turkestan. The cocoa-palm, the bread-tree, the gutta-percha tree, and the like are also grown to a great extent in tropical Asia, while many of our most valuable species of timber came originally from Asia, and are still imported thence to Europe.

On the steppes and plateaus of interior Asia, numberless herds of horses, horned cattle, and sheep furnish all the necessities of life to the nomad or half-nomad Mongolian inhabitants of these regions, and supply the European trade with a yearly increasing amount of hides, wool, and tallow. The forests of the far north and north-east afford the means of existence to nomad hunters, who find, however, severe competitors in the Siberian (Russian) peasants. Both supply the trade with rich furs; while the rivers of Siberia and Manchuria provide food for the nomad Ostiaks, Gols, and Ghilyaks. And finally, the Behring and Okhotsk Seas of the Northern Pacific, and their islands, supply the civilised world with some of the finest furs.

Ways of Communication.—The plateaus, the deserts, and the mountainous regions of Asia, thickly clothed with impenetrable forests and intersected by deep gorges and valleys, are so many obstacles to the communication between different parts of the continent. The roads of Asia, except those of China and India, and a few main lines elsewhere, are mostly mere footpaths or tracks marked in the deserts, with wells far apart, and bleached with the bones of camels. Caravans of camels are therefore the chief means of transport for goods and travellers in the interior; donkeys, yaks, and even goats and sheep are employed in crossing the high passages of the Himalayas; horses are the usual means of transport in most parts of China and Siberia, and in the barren tracts of the north the reindeer, and still farther north the dog, are made use of. Fortunately, the great rivers of Asia provide water communication over immense distances. The deep and broad streams of China, allowing heavy boats to penetrate far into the interior of the country, connect it with the sea; a brisk traffic is carried on along these arteries. In Siberia, the bifurcated rivers supply a water-way not only north and south along the course of the chief rivers running towards the Arctic Ocean, but also west and east; thus a great line of water communication crosses Siberia, and is, with but a few interruptions, continued in the east by the Amur, navigable for more than 2000 miles. In the winter the rivers and plains of Siberia become excellent roads for sledges, on which goods are still chiefly transported.

Railways are only beginning to make their appearance in Asia. In India they already represent a total length of 16,650 miles. Russia, too, has spread her railways far into Asia; a military line now connects the Caspian Sea with Merv, and Merv with Tchardjui on the Amu-daria, and it will be continued towards Samarcand. In the north, Perm—the terminus of steamers navigating the Kama (tributary to the Volga)—is connected by rail across the Urals with Tyumen, whence steamers ply to Tomsk, in the very heart of Siberia, and to Barnaul, in the Altai. It is proposed to connect Tomsk by rail with Lake Baikal and Tchita, or Sryetensk on the Shilka, whence steamers ply to Nikolayevsk, on the Pacific. Finally, China decided in 1886 to open its territory to railway-construction. A brisk traffic is carried on along the shores of Asia, all its chief ports in the south and south-east being already in regular steam communication with Europe and the United States. With regard to the much-discussed northern route

from Europe to Siberia, *via* the Kara Sea and Arctic Ocean, Nordenskjöld's circumnavigation of Asia and the numerous attempts of the last few years have proved it possible; but they have shown also the difficulties in the way of regular traffic.

Telegraph communications are in a much more advanced state than the roads. St Petersburg is connected by telegraph with the mouth of the Amur and Vladivostok (on the frontier of Corea); while another branch, crossing Turkestan and Mongolia, runs on to Tashkend, Peking, and Shanghai. Constantinople is connected with Bombay, Madras, Singapore, Saigon, Hong-Kong, and Nagasaki in Japan; and Singapore stands in telegraphic communication with Java, and Port Darwin in Australia. Finally, Odessa is connected by wire with Tiflis in Caucasus, Teheran, and Bombay.

Trade.—Notwithstanding the difficulties of communication, a brisk trade is carried on between the different parts of Asia, but there is no possibility of arriving at even an approximate estimate of its aggregate value. The maritime exports to Europe, the United States, and overland to Russia, reached, in 1885–86, a value of nearly £175,000,000, and the imports about £125,000,000.

Hitherto Asia has supplied Europe chiefly with raw materials—gold, silver, petroleum, teak and a variety of timber-wood, furs, raw cotton, silk, wool, tallow, and so on; with the products of her tea, coffee, and spice plantations; and with a yearly increasing amount of wheat and other grain. Steam-industry is only now making its appearance in Asia, and, although but a very few years old, it threatens to become a rival to European manufacture. Indian cottons of European patterns and jute-stuffs already compete with those of Lancashire and Dundee. Several of the petty trades carried on in India, China, Japan, Asia Minor, and some parts of Persia, have been brought to so high a perfection that the silks, printed cottons, carpets, jewelry, and cutlery of particular districts far surpass in their artistic taste many like productions of Europe. The export of these articles is steadily increasing, and Japan supplies Europe with thousands of small articles—applications of Japanese art and taste to objects of European household furniture.

Asia, CENTRAL. This term is generally, in its geographical sense, used of the region lying between the Altai Mountains and the Persian Gulf, and includes part of Siberia, all Turkestan, Afghanistan, Beluchistan, and part of Persia. An earlier usage—that of Humboldt—gave this name to the khanates of Bokhara and Independent Tartary. In Russian official language, Central Asia is an administrative division of the empire lying to the SW. of Siberia, and comprising, with part of what used to be called Siberia, the recent Russian annexations in Turkestan. Russian Central Asia is divided into the governments of Akmolinsk, Semipalatinsk, Turgai, Uralsk, Semirechinsk, Sir-daria, Zarafshan, Amu-daria, the Trans-Caspian territory, and Ferghana. The total area is given at 1,201,000 sq. m., and the pop. at 4,390,000. For the physical geography of the region, see ASIA; see also TURKESTAN, SIBERIA, KHOKAND, &c.

Asia Minor (Asia the Less, as distinguished from Asia in the widest extent) is the name usually given to the western peninsular projection of Asia, forming part of Turkey in Asia. The name is not very ancient; originally the Greeks seem by Asia to have meant only the western part of Asia Minor, but with their geographical knowledge, the scope of the name Asia gradually widened. The late Greek name for Asia Minor is Anatolia (q.v.)—*Anatolē*, 'the East,' whence is formed the Turkish

Anadolli. Asia Minor includes the peninsula; the eastern boundary, somewhat artificial, being a line from the Gulf of Skanderoon to the Upper Euphrates, and thence to a point east of Trebizond. The area of the peninsula exceeds 220,000 sq. m. It constitutes the western prolongation of the high tableland of Armenia, with its border mountain-ranges. The interior consists of a great plateau, or rather series of plateaus, rising in gradation from 3500 to 4000 feet, with bare steppes, salt plains, marshes and lakes; the structure is volcanic, and there are several conical mountains, one of which, the Ergish-dagh (Argæus), with two craters, attains a height of 11,830 feet, towering above the plain of Kaisariëh, which has itself an elevation of between 2000 and 3000 feet. The plateau is bordered on the north by a long train of parallel mountains, 4000 to 6000 feet high, and cut up into groups by cross valleys. These mountains sink abruptly down on the north side to a narrow strip of coast; their slopes towards the interior are gentler and bare of wood. Similar is the character of the border ranges on the south, the ancient Taurus, only that they are more continuous and higher, being, to the north of the Bay of Skanderoon, 10,000 to 12,000 feet, and farther to the west, 8000 to 9000 feet. The west border is intersected by numerous valleys opening upon the Archipelago, to the northern part of which Mounts Ida and Olympus belong. Between the highlands and the sea lie the fertile coast-lands of the Levant. Of the rivers the largest is the Kizil Irmak (Halys), which, like the Yeshil Irmak (Iris), and the Sakaria (Sangarius), flows into the Black Sea; the Sarabat (Hermus) and Meinder (Mæander) flow into the Ægean. See ASIA.

The *climate* has on the whole a south-European character; but a distinction must be made of four regions. The central plateau, nearly destitute of wood and water, has a hot climate in summer, and a cold in winter; the south coast has mild winters and scorching summers; while on the coast of the Ægean there is the mildest of climates and a magnificent vegetation. On the north side the climate is not so mild, but the vegetation is most luxuriant.

In point of natural history, Asia Minor forms the transition from the continental character of the East to the maritime character of the West. The forest-trees and cultivated plants of Europe are seen mingled with the forms characteristic of Persia and Syria. The central plateau, which is barren, has the character of an Asiatic steppe, more adapted for the flocks and herds of nomadic tribes than for agriculture; while the coasts, rich in all European products, fine fruits, olives, wine, and silk, have quite the character of the south of Europe, which on the warmer and drier south coast shades into that of Africa.

The inhabitants, some 7,000,000 in number, consist of the most various races. The dominant race are the Osmanli Turks, who number about 1,200,000, and are spread over the whole country; allied to these are the Turkomans and Yuruks, speaking a dialect of the same language. The latter are found chiefly on the tableland, leading a nomadic life; there are also hordes of nomadic Kurds. Among the mountains east of Trebizond are the robber tribes of the Lazæ.

The Greeks and Armenians are the most progressive elements in the population, and have most of the trade; while the Greeks monopolise the professions, the ownership of the land is largely passing into the hands of Greeks, Armenians, and Jews. Administratively the country falls into eight vilayets or governments, with their capitals in Brusa, Smyrna, Konieh (Iconium), Adana, Sivas, Angora, Trebizond, and Kastamuni respectively.

In ancient times the divisions were Pontus, Paphlagonia, Bithynia, in the north; Mysia, Lydia, Caria, in the west; Pisidia with Pamphylia, and Cappadocia, in the south; and Galatia with Lycæonia, and Phrygia, in the centre. The Turkish islands of the Archipelago belong, most of them, to Asia Minor.

Here, especially in Ionia, was the early seat of Grecian civilisation, and here were the countries of Phrygia, Lycia, Caria, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, &c., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2000 years B.C.), to the time of Osman (about 1300 A.D.), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with Mithridates and the Parthians; of the Arabs, Seljuks, Mongols, and Osmanli Turks with the weak Byzantine empire. Here Alexander the Great and the Romans successively contended for the mastery of the civilised world. But, notwithstanding all these wars, the country still continued to enjoy some measure of prosperity till it fell into the hands of the Turks, under whose military despotism its ancient civilisation has been sadly brought to ruin. Recently, considerable portions of Armenia, in some respects part of the peninsula, have been absorbed by Russia. During the treaty negotiations between Russia, Turkey, and the Powers, after the war of 1877, Great Britain made a secret engagement to guarantee against Russian aggression the Asiatic dominions of the Porte, and to assume an indefinite protectorate over Asia Minor.

Asiago, a town of North Italy, 22 miles N. of Vicenza, on a ridge. Pop. (1881) 2016. The surrounding district is known as the Setté Comuni (q.v.).

Asiatic Society, ROYAL, was founded in London in 1823 by several noblemen and gentlemen interested in India and China, for the investigation and encouragement of arts, science, and literature in relation to Asia. The Literary Society of Bombay and Madras, and the Asiatic Society of Ceylon, with that of China at Hong-Kong, are declared to be branch societies of the Royal Asiatic. The Transactions of this society contain many important articles on eastern literature, religion, philosophy, &c. There is a museum and library, the latter being rich in oriental MSS. and Chinese books.

Asinius. See POLLIO.

Asirgarh (also *Aseerghur*), a strong fortress in the Central Provinces, 300 miles NE. of Bombay. It stands on an isolated mountain of the Satpura range, 850 feet above the base, and has been twice taken by the British—in 1803 and 1819.

Askabad, a town of Russian Turkestan, the political centre of Trans-Caspia, situated on the Trans-Caspian Railway, 290 miles SE. of Mikhailovsk, the seaward terminus, and 232 WNW. of Merv. It was occupied by the Russians in 1881.

Aske, ROBERT. See PILGRIMAGE OF GRACE.

Askew, ANNE, Protestant martyr, was born of gentle parentage near Grimsby, Lincolnshire, in 1521. Early embracing the views of the Reformers, she was turned out of doors by her husband, a zealous Roman Catholic. On this she went up to London to sue for a separation; but in 1545 she was arrested on a charge of heresy, and was examined by the Bishop of London and others on the doctrine of transubstantiation. After further examination and torture by the rack, she was burned at the stake, in Smithfield, July 18, 1546.

Askja (Ice., 'basket'), the largest volcano in Iceland, rises out of the vast Odáthahraun lava-desert, near the centre of the island, in 65° N. lat. and 16° 45' W. long. Its vast crater is over 23 sq. m. in area, and about 17 miles in circumference. Almost circular in shape, it lies at a depth of over 700 feet within a mountain built up, by a distinctly marked series of lava-flows, round a volcanic vent, to a height of 4633 feet above the sea. Great volumes of steam are belched forth from numerous rifts and vents, and the whole surface is a chaos of rugged lava-floods, except in the SE., where there is a hot-water lake 5 miles in circumference, and a tract covered with punice ejected in 1875. This great eruption first called general attention to Askja, and it has been stated that the volcano was only then formed; but the traces of innumerable earlier eruptions are found in the walls of the crater, already referred to, where the divisions are marked by the layers of red, slag-like lava, which time after time has formed the surface of the underlying lava-strata. Most of the lava in this eruption found an outlet, not from the crater, but some miles to the NE., where a bed, 20 miles long and 7 broad, now lies.

Asklepios. See **ÆSCULAPIUS**.

Asmodeus, or **ASMO'DEUS** (Heb. *Aschmedai*, 'the destroyer'), a demon mentioned in the later Jewish writings. In the Book of Tobit, he is described as loving Sara, daughter of Raguel, and as having, in the form of a succubus, destroyed in succession her seven husbands; hence, in modern times, he is jocularly spoken of as the destroying demon of matrimonial happiness. In the Talmud, Asmodeus is described as the prince of demons, and is said to have driven Solomon from his kingdom. His real origin may perhaps be traced to the *Ashma daeva*, one of the evil demons of the ancient Persian religion. Le Sage has given him a permanent place in literature by his novel, *Le Diable Boiteux*.

Asmonæ'ans. See **MACCABEES**.

Asoca (*Jonesia asoca*), an Indian tree of the natural order Leguminosæ, sub-order Cæsalpinææ, remarkable for the beauty of its red and orange flowers. The leaves are abruptly pinnate, shining, and very beautiful. The asoca is often mentioned in Indian poetry, and is connected also in various ways with the Hindu mythology.

Asoka, an Indian king, has been called the 'Buddhist Constantine,' having organised Buddhism as the state religion. He was the grandson of Chandragupta or Sandrocottus (q.v.). He began to reign in 264 B.C. As king of Magadha or Behar, Asoka became a zealous convert to Buddhism about 257 B.C., and in 244 he convened the third of the great Buddhist councils at Patna. Throughout his kingdom and the conquered provinces he published the grand principles of the faith; and the fourteen edicts by which these sermons were preached are still found graven deep on pillars, caves, and rocks from Peshawar and Kathiawar to Orissa. About 40 such rock inscriptions in the Indo-Bactrian character (see **ALPHABET**) are still extant; but he is said to have erected 84,000 memorial columns. He regarded proselytism by peaceful means as a state duty. His civil organisation and administration of justice were also admirable. The probable date of his death is 223 B.C.

Asp (Gr. *aspis*), a popular name, applied loosely both in its English and Greek form to various genera of venomous serpents. (1) It is often now applied to the *Vipera aspis* of Southern Europe, which closely resembles the common viper. Several other species of *Vipera* have received the same popular name. (2) Cleopatra's asp, to which allu-

sion is so often made, was most probably the small *Vipera hasselquistii* or horned viper. (3) It is equally impossible and unnecessary to determine with certainty the exact significance of the biblical word 'asp.' Several species of vipers occur in Palestine, but the context would in some cases suggest the Egyptian juggler's snake, *Naja haje*. (4) Another form, which is nearly allied to the Indian cobra da capello (*Naja tripudians*), is, like the latter, very venomous, and has also the habit of dilating the loose skin of its neck. It has been long known, and seems to be often referred to under the titles *aspis*, *aspic*, and *asp*.

Aspar'agine, $C_4H_9NH_2$, $\left\{ \begin{smallmatrix} CONH_2 \\ COOH \end{smallmatrix} \right\} + 2H_2O$, is a crystalline substance which exists ready formed in common asparagus, marsh-mallow, potatoes, chestnuts, liquorice-root, and the young shoots of peas, beans, &c. It is readily obtained from the expressed juice of the young shoots of asparagus, which, after filtration and evaporation to a syrup, soon deposits it in crystalline prisms of a right rhombic form. These crystals dissolve freely in boiling water, the cooled solution having a mawkish and cooling taste, and a slight acid reaction. From a chemical point of view, asparagine is regarded as the Amide (q.v.) of aspartic acid, and forms compounds with acids and alkalis.

Asparagus, a genus of Liliacæ; it contains sixty to seventy species, usually herbaceous, but sometimes shrubby or climbing; the stem is unarmed in some, in others thorny; the young shoots covered with leaf-scales, afterwards very much branched, with numerous fasciculate, generally bristle-like 'leaves,' which are really abortive branches or flower-stalks, the true leaves being

Asparagus :

a, upper end of a stem, showing leaves, &c.; *b*, young shoot.

reduced to minute scales. The most widely diffused species is the Common Asparagus (*A. officinalis*), a native of Europe, which grows on the banks of rivers and on the sea-shore, in meadows and bushy places, especially in sandy soils, occurring wild in a few places in Britain, and which is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, form a much esteemed article of food, which, however, is only in a slight degree nutritious. These sprouts contain a peculiar crystalline substance, called *Asparagine*, and have a specific action on the urinary organs, so that their long-continued use in very large quantities is apt even

to produce bloody urine. They are no longer retained in the pharmacopœia, but both the shoots and the roots of asparagus are still occasionally used as a diuretic in dropsies, and as a lithic to dissolve urinary calculi. For these purposes, the root is preferred, and is administered in the form of an infusion or decoction.—The thick and tender kinds of asparagus are most esteemed for the table. By cultivation it is much increased in size, and considerably altered in general appearance. In its wild state it is seldom more than a foot high, and not much thicker than a goose-quill; whereas it can be obtained in gardens more than half an inch in diameter, while its stems may rise to the height of four or five feet. Asparagus was a favourite vegetable of the ancient Romans. It is raised from seed, and grows best in a rich, fresh, sandy soil. The seed is generally sown in spring, either in the prepared bed, or in drills, from which the shoots may be transplanted when one year old. In England, it is generally planted in rows, at distances varying from 1 foot to 2½ feet, in beds that have been previously prepared by deep trenching (usually 2½ to 3 feet) and rich manuring. The shoots should not be cut till the second year after planting, and then very sparingly at first. Litter or vegetable mould is spread over the bed in autumn. It is allowed to occupy the same ground for many years; well-made beds continuing in a good bearing condition for twenty years or more. Asparagus is grown more extensively in France, where large quantities are raised among the vines. The French method differs chiefly in the substitution of more surface manuring for the English practice of preparing and enriching the bottoms of the beds.—The seeds have been used as a substitute for coffee, and a kind of spirit has been made from the fermented berries. The young shoots of several other species are also eaten, as those of *A. tenuifolius*, *A. acutifolius*, and *A. albus*, natives of the south of Europe; the last of which is used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the Bitter Asparagus (*A. scaber*), which is very similar to the Common Asparagus, are uneatable on account of their great bitterness.

Asparagus Stone. See APATITE.

Aspasia, one of the most remarkable women of antiquity, was born at Miletus. The circumstance that in Athens marriage with foreign women was illegal, has originated the erroneous notion that Aspasia was a courtesan. She certainly broke through the restraint which confined Athenian matrons to the seclusion of their own homes; for after her union with Pericles, who had parted from his first wife by mutual consent, her house became the rendezvous of all the learned and distinguished people in Athens. Socrates often visited her. Her beauty, varied accomplishments, and political insight were extraordinarily great. From the comic writers and others she received much injustice. Hermippus, the comic poet, took advantage of a temporary irritation of the Athenians against Pericles, to accuse Aspasia of impiety; but the eloquence of the great statesman procured her acquittal. Her influence over Pericles must have been singularly great, and was often caricatured—Aristophanes ascribing to her both the Samian and the Peloponnesian war, the latter on account of the robbery of a favourite maid of hers. Plutarch vindicates her against such accusations. Her son by Pericles was allowed to assume his father's name. After the death of Pericles (429 B.C.), Aspasia formed a union with Lysicles, a wealthy cattle-dealer, who, through her influence, became an eminent man in Athens.

Aspe, a romantic valley in the Western Pyrenees, close to the Spanish frontier. It has a population of 12,000, and was formerly a republic under the protection of the princes of Béarn.—**ASPE** is also a town of Valencia, Spain, in the province of Alicante, with a trade in ore and wine. Pop. (1878) 7476.

Aspects, in Astronomy, are certain positions of planets with respect to one another, as seen from the earth. In the days of astrology, there were five Aspects—Conjunction (indicated by the symbol ☿), Sextile (*), Quartile (□), Trine (Δ), Opposition (♌). Two planets are in conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile, when the distance is 90°; trine, when it is 120°; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these aspects great influence over the fate of individuals and of nations. The only two of the terms now in use are *conjunction* and *opposition*. These, the former especially, were often not reckoned as aspects.

Aspen, or TREMULOUS POPLAR (*Populus tremula*; see POPLAR), a tree which grows plentifully in Europe and in Siberia. It is a native of Britain, and is frequently found in Scotland, where it is met with even at an elevation of 1500 feet above the sea. It has received the specific name *tremula*, from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind—a property for which, indeed, the aspen-leaf has become proverbial. The leaves are

Branch of Aspen (*Populus tremula*): a, catkin.

nearly orbicular, but broadly toothed, so as almost to exhibit angles. The footstalks are long, slender, and compressed, which favours the readiness of motion. It grows quickly, with a straight stem, reaching to a height of from 60 to 80, or even 100 feet. The wood is soft, porous, light, white, and smooth; it does not make good fuel, but is very fit for the turning-lathe, and especially for being made into troughs, trays, and pails; whilst in France it is used for sabots. If the stem be peeled and allowed to dry before it be cut down, the wood becomes harder, and is then capable of being used as timber for the interior of houses; and on this account the tree is of great importance in many districts, and the more so as it succeeds in any soil, although it prefers one which is moist and gravelly. The bark contains a great quantity of a bitter alkaloid, *Salicin*. The charcoal made from this tree can be used in the manufacture of gunpowder. The peculiar quivering of the leaves of the aspen has given origin to a wealth of legendary and literary associations with the tree. The old legend that it supplied the wood of the Cross, and has never since ceased to tremble, is even yet quoted as the cause of its ceaseless quivering. It appears to have been highly valued as a timber tree in the time of Henry V., particularly for the making of

arrows. An act of parliament was passed in that reign preventing the consumption of the *aspe* for any other purpose, under a penalty of a hundred shillings. This act was only repealed in the reign of James I.—*Populus tremuloides*, a very similar species, a native of North America, is called the American aspen. It is regarded by some as a mere variety. Very similar, also, is another North American species, *P. grandidentata*.

Aspergillum, a remarkable genus of boring Lamellibranch Molluscs, in which the shell has the form of an elongated cone, terminating at the lower end in a disc, pierced by numerous small tubular holes. The appearance of the disc suggests the rose of a watering-pot, and this has given rise to the popular ('Watering-pot') and technical names. The tube itself is secreted by the siphons through which the water passes in and out. The two minute valves of the young mollusc persist near the lower end of the tube. Similar rudimentary shells are exhibited by allied genera, in the family *Gastrochaenidae*, and by the fossil *Teredina*, which bored the drift-wood of the London clay.

Aspergillum:
a, the disc with holes;
b, the rudimentary
valves.

Aspergillus is the name of a genus of minute fungi or Moulds (q.v.) occurring on decaying substances of various kinds. *Aspergillus* and *Aspergillum* are both

late Latin words (from *aspergere*, 'to sprinkle') for the brush used in the Roman Catholic Church for sprinkling holy water on the people.

Aspern, a small village of Austria, on the left bank of the Danube, nearly opposite Vienna. It was the scene of a sanguinary battle on 21st and 22d May 1809, between the French under Napoleon and the Austrians under Archduke Charles, the French being defeated, after terrible slaughter, on the second day. The loss of the Austrians was 24,000; of the French, 30,000.

Asperula. See WOODRUFF.

Asphalt, ASPHALTUM, or MINERAL PITCH, is the name given to a compact form of bitumen, which is usually black or dark-brown in colour. When free from earthy impurities, it has a conchoidal fracture and resinous lustre. Asphalt is generally found wherever rock-oil occurs, and in such localities it is clearly produced by the drying up of the petroleum. In some places, however, it occurs in beds forming a compact rock. The Dead Sea, the district near Babylon, some of the West Indian Islands, notably the *Pitch Lake* in Trinidad, and one or two places in France, Switzerland, and Dalmatia, are the best-known localities for this substance; but it is found, more or less, in a great many countries. Asphalt was employed by the ancient Egyptians for embalming their dead, and it was used in Babylon as mortar. Its modern applications are numerous. It is an ingredient in Japan varnish, and is used along with other materials to make waterproof roofing and flooring, linings for cisterns, and along with pasteboard material in the construction of water-pipes. It is much used to form what are called 'damp courses' in walls of buildings—that is, a layer of it, from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch thick, is spread over the thickness of a wall near the ground-level, to prevent the ascent of damp. Frequently nowadays the whole internal area of a house is covered with a layer of asphalt. In cases where the wall of a house comes against a bank of earth, the whole

surface is protected from damp by a lining of this material. One or two kinds, such as those found at Seyssel in the east of France, and at Val-de-Travers in Switzerland, though called asphalts, are really bituminous limestones. The latter is known all over the world as a material for pavement. This Val-de-Travers asphalt is prepared by relaxing the natural rock, which contains from 7 to 20 per cent. of bitumen, to powder, and then putting it with a small quantity of melted bitumen into a caldron. After it is fused and stirred for some time, it is run into moulds to form blocks of about 1 cwt. each. These blocks are called 'asphaltic mastic,' and the finest kinds contain 87 per cent. of carbonate of lime and 13 of bitumen. This mastic should not melt below 165° F. It has, especially since 1854, been very extensively employed in the construction of pavements. When this material is used, there is, of course, far less noise produced by the traffic on the streets than with stone. For paving purposes, the 'asphaltic mastic' is heated in portable boilers, into which at a certain stage of the preparation, there is poured about 25 per cent. of thoroughly dried sand, gravel, or powdered limestone, which is well mixed with the liquid asphalt. The mixture is then spread on the spot prepared for it, and when it forms a hard kind of pavement. In Paris, but for carriage-ways and foot-pavements, it has been largely employed for more than thirty years, having been introduced by Napoleon III. with a view it is said, to prevent the erection of barricades with paving-stones. In more recent times it has been extensively used in Berlin, and many other continental towns, for the same purposes. In London and other parts of Great Britain, foot-pavements are still frequently made of it, but it has been but very partially used for carriage-ways. For this last purpose the moist climate of our island probably renders it more slippery than on the Continent. Pavements formed of artificial or coal-tar asphalt have long been, to a limited extent, in use; but this material is not so suitable for them as the natural asphalt (see GAS-TAR). It is well to state, however, that artificial asphalt is more used for 'damp courses' than the asphalts from bituminous limestone, although the latter are much better. Of late years, an asphalt made of coal-tar pitch and a cheap mineral oil called creosote oil, has been much used for the joints of wood-pavement and causeway stones, and does very well. The pigment known as asphaltum is sometimes prepared from natural asphalt, but more frequently from the residue of distilled bituminous substances. Unfortunately, its fine transparent brown colour has tempted some distinguished modern artists to use it largely. Through its property of not drying thoroughly and free of cracks, a number of pictures painted some years ago by Horace Vernet, Sir George Harvey, and others, are now mere wrecks. For the synonyms of asphalt, see BITUMEN.

Asphodel (*Asphodelus*), a genus of perennial herbs belonging to the order Liliaceae. The roots are fleshy and fasciculated, the leaves linear, and the flowers are arranged in long racemes, often compound, and continue flowering during great part of winter and early spring in their native country, covering, for instance, the bleakest hillsides in Greece with enduring blossom, whence probably their association in Greek mythology, and thence throughout poetry, with the Elysian fields. The species are not very numerous, and are mostly natives of the countries around the Mediterranean Sea. The Yellow Asphodel or King-Spear (*A. luteus*) and the White Asphodel (*A. albus*) have long been known in Britain as garics

flowers. The yellow asphodel has an unbranched stem 2-3 feet high, much covered by the sheathing bases of the long narrow leaves. The leaves of the

White Asphodel (*Asphodelus albus*).

white asphodel are all radical, and its flowers are in branched clusters.

Asphyxia (Gr.), literally 'pulselessness,' but usually applied to the condition resulting from the blood in the body no longer being brought into the proper relations to the atmospheric air by respiration, so as to allow a sufficiently free exchange of carbonic acid for oxygen (see **RESPIRATION**). Asphyxia, or suspended respiration, may result from several causes. No air, or but a scanty supply, may be admitted, as in strangulation, drowning, choking, or disease in the windpipe; the chest may be prevented from expanding either from a superincumbent weight or paralysis, as when a man breaks the upper part of his neck above the phrenic nerve, thus paralysing the diaphragm; and again, although there may be every capacity for respiration, the air itself may be in fault, and contain too little oxygen or too much carbonic acid in proportion to other elements. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen, or impregnating it with excess of carbonic acid.

When from any of the above causes asphyxia occurs, the respiratory movements become quicker and more forcible than normal, and additional muscles are brought into action till the respiratory acts merge in general convulsions. Meanwhile consciousness has been lost; the blood, unable to circulate freely through the lungs in consequence of its imperfect oxygenation, accumulates in them, in the right side of the heart, and in the veins, and the skin becomes livid. The short convulsive stage is followed by one of comparative quiescence, in which respiratory efforts more natural in appearance are made, but become slower and weaker till

they stop altogether. The heart continues to beat feebly for a short time after all other movements have ceased.

After death the blood is very dark in colour. It remains fluid, or nearly so, and consequently gravitates very readily to the part of the body which happens to be most dependent. The right side of the heart is found distended with fluid blood, the left nearly empty. The lungs are usually, though not always, much congested.

In man death occurs in from a minute and a half to five minutes after complete deprivation of oxygen. Some persons, no doubt, as the Ceylon divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood-vessels by which they are enabled to be under water for a long time. Restoration of asphyxiated persons may be attempted with hopes of success at a very long period after apparent death. The object of all methods is of course to fill the lungs with fresh air. For a description of these, see **RESPIRATION (ARTIFICIAL)**.

Asphyxiants, chemical substances inclosed in shells or other projectiles, and which act by producing a suffocating and poisonous effect. The French secretly made experiments with asphyxiating shot at Brest in 1851. The principle of these missiles seems to have been to carry into an enemy's ship the means of generating deadly gases which would suffocate the crews between decks. A similar device, the stinkpot, is a favourite instrument of warfare amongst the Chinese and the pirates of the eastern seas. Besides being used in this sense, the term asphyxiants is applied to any gases having a suffocating or poisonous effect on the human system. Thus coal-gas escaping in a house, the carbonic acid gas filling wine-vats, or liberated in coal-pits after an explosion of fire-damp, and the various products of combustion, are all asphyxiants which daily claim their victims. In manufactories, numerous instances occur of workmen venturing incautiously into tanks containing the vapours of chloroform, alcohol, aniline, petroleum, and other liquids, all of which act as asphyxiants. A striking case of asphyxiation occurred on 25th September 1886, at Craræ quarry, Loch Fyne, where seven tons of gunpowder were exploded in order to shatter an immense face of rock. A large party of excursionists, who had witnessed the grand explosion from a steamer, landed shortly afterwards, and entered the quarry. Without any warning, about forty of them were suddenly struck down by the poisonous suffocating vapours, and although soon removed to fresh air, seven of them never rallied. — There are many devices in use for extinguishing fires by means of a portable apparatus which produces an asphyxiating gas, such as carbonic acid gas. Fire-extinguishers of this kind are called asphyxiators.

Aspic (Fr.), a savoury meat-jelly, containing fish, game, hard-boiled eggs, &c.

Aspidium. See **FERN (MALE)**.

Aspinwall, or **COLON**, a town in Colombia, virtually, however, a colony of the United States. It is situated at the Atlantic extremity of the Panama Railway (1849-55), and of the inter-oceanic Panama Canal (1881-90), on the island of Manzanilla in Limon Bay, 8 miles NE. of the old Spanish port of Chagres, 47 NW. of Panama by rail, and equidistant from the great trading capitals of Valparaiso and San Francisco. Pop. about 1500, mostly blacks. From its commanding position as a place of transit, Aspinwall benefits by the traffic in both directions. The climate, formerly very unhealthy, has been greatly

improved by drainage. In 1870 the Empress Eugénie presented the town with a statue of Columbus, after whom it is named officially Colon. The name Aspinwall it derives from a New York merchant, the originator of the Panama Railway; the company having founded the town in 1850. It was burned by insurgents in 1885.

Aspirate (Lat. *spiro*, 'I breathe'), the name given to the letter *h* in grammar, as marking, not an articulate sound, but a *breathing*. It is accordingly used for the *spiritus asper* or 'rough breathing' in Greek, which, written over an initial vowel, had the force of an *h* prefixed. The name aspirate is also applied to two classes of consonants—those really blended with *h*, like the Sanskrit aspirates, or in European languages, to those followed by *h*, like the English *th*, *ch*, with *f* and *v*. In the latter and wider sense, of sixteen English mute sounds (see LETTERS), eight are *lene*, each having its corresponding aspirate; the aspirates *f*, *v*, *th* (as in *thin*), *th* (as in *thine*), *ch*, *gh*, *sh*, *zh*, corresponding to *p*, *b*, *t*, *d*, *k*, *g*, *s*, *z*, respectively.

Aspirator is the name of an apparatus employed to draw air or other gases through bottles or other vessels. It is of great use in the examination of gases by the analytical chemist. The simplest form of the apparatus is that represented in fig. 1, where

Fig. 1.

at D denotes the temperature of the water, and subsequently gas, contained in the reservoir, while the upright turn of the tube B keeps any air from entering the reservoir by that route. Another form of aspirator is represented in fig. 2. A is connected with a supply of water under pressure. As the jet of water is forced into the contracted neck at D,

Fig. 2.

it draws the air from B along with it down the outlet pipe C. This form of aspirator is much used in the chemical laboratory for filtering purposes. Into the neck of the funnel is placed a small cone of platinum foil, and thereafter the filtering-paper is carefully fitted, taking care to avoid any creases. The funnel is then passed through an india-rubber cork, fitted to a strong flask, and provided with a tube connecting it with the aspirator. On opening the stopcock B, a partial vacuum is formed in the flask, and the liquid in the filter rapidly passes through. For this purpose a simpler form of aspirator, or filter-pump (as it is also called), is used, represented in the second diagram. A connects with a supply of water under pressure, while B leads to the filtering flask. On forcing water through A, the jet as it passes into the contracted neck at D draws the

air from B in along with it, and carries it down the outlet pipe C, thus producing the required vacuum.

Asplenium. See SPLEENWORT.

Aspromonte, a rugged, finely-wooded mountain in the SW. corner of Italy, near Reggio, forming the extremity of the Southern Apennines, and overlooking the Strait of Messina. The summit, Montalto (6907 feet), commands a wide and beautiful view, but the ascent is very laborious. Here Garibaldi (q.v.) was defeated and captured, 28th August 1862, by Pallavicini.

Aspropotamo. See ACHELOUS.

Ass (*Asinus*), a genus of Perissodactyla (q.v.), closely related to the Horse (q.v.). It differs from the latter in having short hair at the root of the tail and a long tuft at the end, in the absence of warts on the hind-legs, and in the persistence of stripes, except in albinos. The upright mane, the long ears, the cross stripe on the shoulders, and the dark bands on the back, are also characteristic.

The domesticated form is referred for its origin by Darwin to the wild Abyssinian ass (*A. tenuipus*); and he notes how the former sometimes exhibits, in the presence of cross bands on its legs, an atavistic reappearance of a character generally present in the latter. The domestication took place at an early date, probably before that of the horse, and apparently in Asia; but the donkey has been common in England only since Queen Elizabeth's time. The dwarfing and degeneration so generally exhibited are the results rather of ill-treatment and careless breeding than of uncongenial climate, as the condition of the domesticated forms in some favourable parts of the East plainly indicates. In Arabia, Syria, Egypt, Spain, Kentucky, and elsewhere, the asses are well cared for, and the breed has been considerably varied and improved; a Spanish he-ass of a good breed may be worth £200. In Britain not a little improvement has been due to the kindly interest of the late Lord Shaftesbury. The stupidity for which the animal has for long been proverbially reproached seems largely the result of human influence. The male ass is capable of procreation at two years old; the female carries her foal eleven months. The mule is a hybrid bred between mare and male ass; while the hinny is the rarer result of hybridism between horse and female ass. The mule is much nearer in temper and appearance to the ass than to the horse; the hinny in some points resembles the horse more, as it neighs, while the mule brays like the ass. The ass is admirably adapted for a beast of burden, being remarkable for endurance, hardiness, and docility under kind treatment. The peculiar pace, the quaint intelligence, often superior in spite of ill-usage to that of the horse, curious traits of character such as the aversion to cross water, which is probably an unconscious recollection of ancestral nomadic life, the longevity and general hardiness, are facts as familiar as the names donkey, dicky, neddy, cuddie, &c. of these useful animals.

The various species of wild asses are handsomer in form than the familiar degenerate donkey. They have shorter ears, and longer, finer limbs. The shy, swift *A. onager* occurs in herds in the Asiatic deserts, migrating southwards in winter. The large, handsome *A. hemionus*, with dark stripes on its back, inhabits high plateaus from Tibet to Mongolia; see DZIGGETAI. The Abyssinian form has been already noted as the probable ancestor of the donkey. The even wilder Zebras and Quaggas will be discussed separately.

The wild ass is hunted in the East—e.g. in Persia; and the flesh of the hardly-won booty is much esteemed. The milk of the ass is more sugary and less cheesy than that of the cow, and is on that account recommended to some invalids—

e.g. consumptives. The leather called Shagreen (q.v.) is made by a peculiar process from the skin, which is also utilised for shoes and drums. The

The Wild Ass.

ancients are said to have used the bones for making flutes. From early times, white (albino) asses were reserved for the use of the honoured. The reader may be referred to Darwin's *Animals and Plants under Domestication*, where some other works are noted. See DOMESTICATION, HORSE, ZEBRA, QUAGGA.

Assab Bay, an Italian trading station on the west coast of the Red Sea, 40 miles NW. of the Strait of Bab-el-Mandeb. The district around it, with an area of 243 sq. m., and 1300 inhabitants, was sold in 1870 by some Danakil chieftains to an Italian steamship company for a coaling station on the road to India. In 1880 it was taken over by the Italian government, who, since 1884, have improved the harbour and erected a lighthouse.

Assai, a creamy, purplish beverage used on the Amazon, made from the fruit of certain palms.

Assal, a large salt-lake in the district of Adal in Eastern Africa, nearly 9 miles from the coast of the Bay of Tajurrah. It is nearly 600 feet below the level of the sea. Abyssinian caravans resort to Assal for the purpose of carrying off the salt, which is thickly incrustated on its shores.

Assam, a province at the NE. extremity of British India, stretching in N. lat. between 23° and 28°, and in E. long. between 89° and 97°, with an area of 46,341 sq. m. In 1874 it was formed into a separate administration (including Cachar) under a chief-commissioner. It consists of a fertile series of valleys, watered by the Brahmaputra and more than sixty lesser rivers. It is thus very fertile, and abounds in wood. The tea-plant is indigenous, and some believe that the *Thea assamiensis* is the original of the Chinese plant. Since 1840, when its commercial cultivation was begun, 600,000 acres have been taken up for tea; in 1882 there were over 1000 gardens. Some three-fourths of the tea grown in India is the produce of Assam; and between 1875 and 1885 the total exports of Indian tea increased from 25,000,000 lb. to above 65,000,000 lb. Coolies are imported from Western Bengal for the work in the tea-gardens. The other products are rice, mustard, gold, ivory, amber, musk, iron, lead, petroleum, and coal. From Bengal the principal imports are woollens, India fabrics, salt, opium, glass, earthenware, tobacco,

betel, &c. For want of population, scarcely a fourth of the fertile area is cultivated. There is steamboat communication from Calcutta to Dibrugarh, 661 miles, and a railway from Calcutta to Dhoobri, 322 miles. The revenue in 1882-83 was £584,921, and the expenditure £615,759.

In 1826, at the close of the first Burmese war, Assam was ceded to the British. The upper portion of the province, however, was conferred, as a separate principality, on the native rajah, whom the Burmese had expelled; and it was only in 1838, that in consequence of his misgovernment, the entire country was placed under British administration. Since then the province has exhibited a noticeable improvement. The population being rural and agricultural, the only towns of any size are Gauhati (12,000) and Sebsagar (6000). The peasantry are indolent, good-natured, and fairly prosperous, short and robust in person, with a flat face and high cheek-bones, and coarse black hair. A majority of the people are Hindus. In 1883 there were 1500 educational institutions, with an attendance of 50,000 pupils.

One of the most striking features of Assam is the abundance of wild animals, such as tigers, rhinoceroses, leopards, bears, buffaloes, and elephants. The snakes are the most destructive to human life. Some 400 people are killed every year by wild animals, for whose destruction about £1000 is yearly paid as a reward. The forests teem with game, and the rivers with fish. Pop. (1872) 4,124,972; (1881) 4,881,426, being 105·3 to the square mile. See Hunter's *Statistical Account of Assam* (1880).

Assassination, the act of taking the life of any one by surprise or treacherous violence, either by a hired emissary, by one devoted to the deed, or by one who has taken the task upon himself. Generally, the term is applied to the murder of a public personage by one who aims solely at the death of his victim. In ancient times, assassination was not unknown, and was often even applauded, as in the scriptural instances of Ehud and Jael, and in the murder of Hipparchus by Harmodius and Aristogeiton (q.v.); but assassination by enthusiasts and men devoted to an idea first becomes really prominent in the religious struggles of the 16th and 17th centuries. To this class belong the plots against the life of Queen Elizabeth; while the horrible succession of assassinations of Roman emperors is simply a series of murders prompted by self-interest or revenge. Omitting these last, which are noted elsewhere, the following list includes the most important assassinations, arranged in chronological order. With one or two exceptions, fuller accounts of the persons mentioned will be found under their particular headings.

Julius Cæsar.....	Mar. 15,	B.C. 44
Thomas Becket.....	Dec. 29,	A.D. 1170
Albert I., Emperor of Germany.....	May 1,	1308
James I. of Scotland.....	Feb. 21,	1437
Alessandro de Medici.....	Jan. 5,	1537
Cardinal Beaton.....	May 29,	1546
David Riccio.....	Mar. 9,	1566
Lord Darnley.....	Feb. 10,	1567
James, Earl of Murray, Regent.....	Jan. 23,	1570
William of Orange.....	July 10,	1584
Henry III. of France, by Jacques Clément.....	Aug. 1-2,	1589
Henry IV. of France, by Ravaillac.....	May 14,	1610
Villiers, Duke of Buckingham, by Felton.....	Aug. 23,	1628
Wallenstein.....	Feb. 25,	1634
Archbishop Sharp.....	May 3,	1679
Gustavus III. of Sweden.....	Mar. 16; died Mar. 29,	1792
Marat, by Charlotte Corday.....	July 13,	1793
General Kleber, at Cairo.....	June 14,	1800
Paul, Czar of Russia.....	Mar. 24,	1801
Spencer Perceval, premier, by Bellingham.....	May 11,	1812
Kotzebue, the dramatist.....	Mar. 23,	1819
Duc de Berri.....	Feb. 13,	1820
Charles III., Duke of Parma.....	Mar. 26; died Mar. 27,	1854
Abraham Lincoln, by Booth.....	April 14; died April 15,	1865

Michael, Prince of Servia.....	June 10, 1868
Marshal Prim.....	Dec. 28; died Dec. 30, 1870
Georges Darboy, Archbishop of Paris, by communists.....	May 24, 1871
Earl of Mayo, governor-general of India.....	Feb. 8, 1872
Sultan Abdul-Aziz.....	June 4, 1876
Alexander II., Czar of Russia.....	Mar. 13, 1881
James Abraham Garfield, at Washington, by Guiteau.....	July 2; died Sept. 19, 1881
Lord Frederick Cavendish and T. E. Burke, in Phoenix Park, Dublin.....	May 6, 1882

In the foregoing list no mention is made of plots or attacks ending in failure. Several of those who fell had previously escaped more than once. The *Assassination Plot* in English history was a conspiracy by some Jacobites to murder William III. in 1696. It is doubtful whether Louis XIV. and James II. were privy to the scheme; the chief conspirator was Sir George Barclay. The king was to have been assassinated at Turnham Green on his return from a hunting-party; but one of the forty conspirators sent word to the king, the hunting was postponed, a number of the conspirators were arrested, and nine of them executed. A catalogue of unsuccessful attempts at assassination would be too long for insertion here; but the most important within the last hundred years have been directed as follows: Against Alexander III. of Russia, repeatedly; Alfonso XII. of Spain, 1878 and 1879; Amadeus of Spain, 1872; Duc d'Aumale, 1841; Prince Bismarck, 1866 and 1874; Francis Joseph of Austria, 1853; George III. of England, 1786 and 1800; George IV. (when Regent), 1817; Humbert I. of Italy, 1878; Isabella II. of Spain, 1847, 1852, and 1856; Louis-Philippe, six attempts from 1835 to 1846; Lord Lytton, Viceroy of India, 1878; Napoleon I., by infernal machine, 1800; Napoleon III., twice in 1855, and Orsini's attempt in 1858; Queen Victoria, June 10, 1840, May 30, 1842, July 3, 1842, May 19, 1849, and March 2, 1882; William I. of Germany, 1861, 1875, and twice in 1878. See the next article; also, BARTHOLOMEW'S DAY, GUNPOWDER PLOT, NIHILISM, THUGS; and the article 'Political Assassination' in the *Edinburgh Review* for July 1887.

Assassins, a fanatical branch of the secret Moslem sect of the Ismailis (q.v.). The esoteric doctrines of the latter taught that all actions were morally indifferent; and the atrocious career of the Assassins was but a natural sequence of such teaching. The founder of this body, Hassan-ibn-Sabbah, a Shiite of Khorassan, had, about the middle of the 11th century, studied at Nishapur, and had subsequently obtained from Ismaili *dais*, or religious leaders, a partial insight into their secret doctrines, and a partial consecration to the rank of *dai*. But at Cairo he quarrelled with the heads of the sect, and was forced to quit Egypt, and return by Aleppo and Damascus to Persia. Here he gradually gathered followers, and in 1090 he conquered the rock-fortress of Alamut, in Persia, founding there a famous society, resembling the Ismailis in speculative doctrines, but marked by one peculiar feature—the employment of secret assassination against all enemies. The internal constitution of the order was as follows: First, as supreme and absolute ruler, came the *Sheikh-al-jabal*, the 'Old Man of the Mountains.' Then came his three viceregents, the *Dai-al-kirbal*, or grand-priors of the order; thirdly, the *Dais*, or priors; and fourthly, *Refks*, associates, which last were not initiated, like the former, into all the secret doctrines. To the uninitiated belonged first of all the *Fedavis* or *Fedais* ('the devoted'), a band of resolute youths, the ever-ready and blindly obedient executioners of the Old Man of the Mountains. Before he assigned to them their bloody tasks, he used to have them thrown into a state of ecstasy, by the intoxicating influence of the *hashish* (the hemp plant), which circumstance led to the order

being called *Hashishin* ('hemp-eaters'). The word was changed by Europeans into *Assassins*, and transplanted into the languages of the West with the signification of 'murderers.' The *Lasiks*, or novices, formed the sixth division of the order, and the labourers and mechanics the seventh. Upon these the most rigid observance of the Koran was enjoined; while the initiated, on the contrary, looked upon all positive religion as of no importance. This powerful and unscrupulous sect soon inspired widespread terror. Hassan died in 1124, leaving as his successor his chief *dai*, Kia-Busurg-Omid. Under him the Assassins established a stronghold in Syria, and proved their power by the murder of two successive califs. In 1163 Hassan II. was rash enough to extend the secret privilege of the initiated—exemption, namely, from the positive precepts of religion—to the people generally, and to abolish Islamism in the Assassin state; which led to his falling a victim to his brother-in-law's dagger. Under the rule of his son, Mohammed II., who acted in his father's spirit, the Syrian *Dai-al-kirbal* Sinan became independent, and entered into abortive negotiations with the Crusaders. It was his emissaries who killed Count Raymond of Tripoli and Conrad of Montserrat. Mohammed was poisoned by his son, Hassan III., who reinstated Islamism for the uninitiated. Hassan was succeeded by Mohammed III., a boy only nine years old, who, by his effeminate rule, led to the overthrow of the order, and was eventually murdered by the command of his son, Rokneddin, the seventh and last Old Man of the Mountains. In 1256 the Tartar prince, Hulaku, burst with his hordes upon the hill-forts of Persia held by the Assassins, and destroyed them. The Syrian branch was also nearly extirpated in 1270 by the Mameluke sultan, Bibars. A heretical sect descended from them still linger in the mountainous parts of Syria, among the Druses and Ansarii, and cling to a belief in the allegorical interpretation of the Koran. See Von Hammer, *Geschichte der Assassinen* (1818); Walpole, *The Ansayrii, or Assassins* (3 vols. 1851); and Guyard, *Fragments relatifs à la Doctrine des Ismaélis* (1874).

Assault. In English law, a person is guilty of an assault if he attempts unlawfully to apply any force, however slight, to the person of another, or if he uses any gesture indicating an intention to commit an assault. If any force, however slight, is actually applied to the person or dress of another, the act amounts to *battery*. If a person violently deprived another of a member proper for his defence, such as a leg, an arm, a finger, an eye, or a fore-tooth, the ancient law held him guilty of *mayhem* or *maining*; but this term is now obsolete. Violence is not necessary to constitute an assault; for the law, says Blackstone, cannot draw the line between different degrees of violence, and therefore prohibits the first and lowest stage of it, every man's person being sacred. Mere words can never constitute an assault.

Assault is a civil wrong, giving rise to an action for damages; and, as a general rule, the court will not interfere with the discretion of the jury in assessing the damages. It is sufficient to prove any act from which the unlawful intention may be implied. Thus, throwing water on a man, or riding after him and compelling him to run away, are both acts of trespass or assault. If X throw a lighted squib at Y, who in self-defence throws it from him so that it falls on Z, this is an assault by the first thrower, X, on Z. The defendant may plead that his act was unavoidable, or that it was committed by leave of the plaintiff, or in self-defence, or (if the plaintiff be his child) that the assault was committed by way of reasonable chastisement. He may also plead that the case has

already been disposed of by a court of summary jurisdiction; and magistrates dealing with ordinary charges of assault are empowered to give a certificate which protects the person charged against further proceedings.

A common assault is a misdemeanour, punishable by one year's imprisonment. It is plain that all crimes against the person, such as robbery or murder, include an assault. Special statutory provisions apply to the following cases of aggravated assault: (1) *Indecent assault*. It is an assault to take indecent liberties with a female, even if her consent is procured by fraud, as, e.g. if the offender pretends to be her husband. (2) *Assaults on public officers, clergymen, &c.* in the performance of their duties. (3) *Assaults causing actual bodily harm*, which are punishable by five years' penal servitude. Assaults with intent to do grievous bodily harm, as, e.g. by shooting, or administering poison, or placing an obstruction in front of a railway train, usually amount to felony, and are punishable with penal servitude for life. Maliciously starving a servant or apprentice is a misdemeanour.

Generally speaking, the same defences may be relied on in criminal and civil proceedings. But consent is no defence where the injury done extends to maiming, or to a breach of the peace. The principals in a prize-fight, for example, are guilty of assault, and all persons present at the fight are aiders and abettors in the commission of the offence.

In Scotland, the principle of the law of assault, and of its aggravations, is very much the same as that above stated. In the Scotch system, it is laid down that it is of the utmost importance in all cases of actual assault to ascertain who struck the first blow, and the party who receives it will be excused for retaliating, if he do not exceed the just and fair measure of resentment. There, too, the highest of all aggravations is the assault with intent to murder. It is also an aggravation that the assault has been committed in pursuance of an old grudge, and on a principle of revenge; where, also, the offence has been accompanied with an intent to compel a rise of wages, or to deter from working at a certain rate, or in pursuance of a combination entered into for these illegal purposes. Another aggravation of the offence in Scotland is its being committed by a child on its parent, by a husband on his wife, or by any person upon another within his own house, although the latter crime falls more strictly under the antiquated term of *Homesucken* (q.v.). The remedy in Scotland is, as in England, by civil action of damages, and by a criminal prosecution, both being maintainable, and the latter usually at the suit of the Lord Advocate, as public prosecutor; but the private injured party may prosecute criminally should the Lord Advocate decline to do so.

The Scotch law formerly recognised a separate offence known as battery *pendente lite*, which consisted in assaulting an adversary in a lawsuit during its dependence. This offence was created by statute passed in 1584 and 1594, which provided, quaintly enough, that the offender should be punished by losing his cause. The statutes in question were repealed in 1826.

In the United States, the same general definition of an assault is accepted. Special statutes provide for punishment of assaults on government officials while in the discharge of their duty; but in general, assaults, whether with or without a dangerous weapon, are punishable under state laws rather than under those of the United States.

Assaye, an Indian village in the extreme north-east of the Nizam's dominions, 43 miles NE. of Aurangabad, the scene of a decisive victory gained

by General Wellesley, afterwards Duke of Wellington, 23d September 1803, with 4500 men, over a Mahratta force of 50,000 under Sindia and the rajah of Benar. About a third of Wellesley's small force was killed or wounded, while 12,000 of the enemy fell. The victory was the first great blow to the Mahratta supremacy.

Assaying is the art of determining the proportion of any specified metal in a given metallic ore or in an alloy. The various methods of estimating the amounts of base metals present could not, however, be usefully set forth within the limits of the present article, and the reader who requires technical information in regard to them must be referred to the special works enumerated at the end: we shall here limit our attention to the methods commonly adopted for ascertaining the amount of gold or silver present in an ore or alloy. Although the actual process adopted for assaying an ore is the same as for an alloy, the former has to be subjected to certain preliminary treatment in order to bring the metal present into a convenient form. This consists of 'scorification' or 'fusion,' with or without a previous 'roasting,' in case carbonaceous or other oxidisable substances are present, as happens with jewellers' 'sweep,' &c. Such roasting is conducted in an open dish with free access of air, as in a muffle furnace. The process of scorification is conducted also in a muffle furnace, in a non-porous fireclay dish or 'scorifier' heated to bright redness. One part by weight of a carefully taken sample of the ore in a fine state of division is mixed in the scorifier with from ten to twenty times its weight of granulated lead, and one-tenth its weight of borax, and the whole left in the muffle for about half an hour. On withdrawing the scorifier, its contents are poured into a cup-shaped iron mould, and when cold, the slag can be detached from the lead button, which contains all the gold and silver originally present in the ore, and only requires to be cupelled as explained below. When the 'fusion' or 'crucible' method is adopted, the prepared ore is mixed with red lead, charcoal-powder, carbonate of soda, and borax, in proportions depending on the nature of the ore, and placed in a crucible which is heated in an ordinary furnace for about a quarter of an hour, when the whole may be poured into a mould, and a lead button, containing the precious metals, obtained as in the scorification process.

The 'cupellation' method of assaying gold and silver is of the highest antiquity. It depends essentially on the fact that molten litharge, monoxide of lead, PbO , is capable of holding in solution oxides of other metals with which it may be brought in contact, and thus separating them from unoxidisable metals. If, for example, gold, silver, copper, and lead are brought into a state of fusion in a current of air, the lead on becoming oxidised will take up the oxidised copper; the gold and silver, however, being unoxidisable, will not be so absorbed, and it only becomes necessary to provide a means of removing the oxides in order to obtain the precious metals which have thus been isolated. This is readily effected by using a 'cupel,' formed of compressed bone-ash, of some such form as is shown in fig. 1; being porous, it absorbs the oxides, while the molten gold and silver remain on its surface like a bead of mercury. One or more of these cupels, according to the number of assays to be made, are arranged on the floor of a muffle or oven of fireclay, provided with orifices at the sides and ends to produce the requisite draught, as indicated in fig. 2, and heated externally by anthracite, coke, charcoal, or gas. The operations comprised in the assay of an alloy containing silver by cupellation may be thus briefly described. A clean piece of the alloy, say

12 grains in weight, is accurately weighed on an assay balance. It may then conveniently be wrapped up in the whole or a portion of the

Fig. 1.

Fig. 2.

lead required for cupellation in the form of foil. The amount of lead taken, being dependent on the proportion of oxidisable metal present in the alloy, will, of course, depend on the composition as approximately judged from the colour, appearance of cut, &c.: three times the weight of the assay-piece for fine, or nearly fine, silver, six times for English standard (92.5 per cent.), and a still greater proportion for coarser varieties. The muffle having been raised to a red, but not bright-red, heat, the assay parcel is charged into a cupel, and the temperature maintained uniform. After a lapse of from twenty minutes to half an hour, it will be found that all the lead has been converted into litharge, and either volatilised or absorbed by the cupel, the completion of the operation being preceded by the passage of brilliant iridescent colours over the surface of the button, and, as soon as these cease, by an instantaneous increase in its brilliancy, known as *flashing* or *brightening*. The muffle is now closely shut up, and the temperature allowed to gradually fall until the button is set. It is then removed, hammered to detach adhering bone-ash, and weighed.

If there is reason to suspect the presence of small quantities of gold, it will only be necessary to dissolve the silver button, after weighing, in nitric acid (equal parts pure acid and water), collect the black deposit (the gold) that remains undissolved, and wash, ignite, and weigh it.

In many cases it is possible to ascertain the amount of silver present in an alloy without resort to cupellation. For this, the *humid*, or Gay Lussac's method, it is essential that the composition be previously known within comparatively close limits. Knowing this, it is easy to calculate what weight of the alloy contains 1 gramme of pure silver, by simply dividing the estimated percentage composition into 1000. This amount having been dissolved in nitric acid (equal parts pure acid and water), a measured volume of solution of common salt, standardised so as to precipitate exactly 1 gramme of silver, is added. By vigorously shaking the bottle for a few minutes, the white precipitated chloride will agglomerate, leaving a clear solution above; and on adding a small quantity of salt solution, the production of a further precipitate will indicate the presence of silver still in solution. Measured quantities being thus added, and the bottle shaken after each addition, a point will be reached at which no further precipitation occurs, and the total quantity of salt solution employed affords a means of ascertaining how much silver was actually present in the portion of alloy taken for assay. If W be the weight of silver alloy taken in grains, A its assay, M the volume in c.c.s. of standard salt solution (of which 100 c.c. will precipitate 1 gramme of silver) required to saturate it, then $A = \frac{10M}{W}$.

The method of assaying gold alloys remains to be considered. This is always effected by cupellation, and, in the rare event of silver being *known* to be entirely absent, a simple cupellation with

lead, as in the case of silver, will suffice, a gold button being obtained and weighed. If, however, even a trace of silver is present, the process involves several additional operations to effect its complete removal. The *inquartation* method adopted derives its name from the fact that the gold present is associated with about three times its weight of silver previous to cupellation, the object being to obtain a button in which the gold is distributed like a sponge so as to facilitate the subsequent removal of the silver by solution in nitric acid. The amount of lead varies, as in the case of silver, with the composition. With gold, from pure down to 22 carat, about six times its weight; from this point to 15 carat, eight times; and for lower qualities, ten times its weight will generally suffice. It is generally safer to take a weight of silver equal to two and a half times the weight of gold estimated to be present. The assay-piece, which may weigh half a gramme, having been very accurately weighed, is wrapped, together with the requisite silver, in the lead, and charged into a cupel in the muffle, the temperature of which may be appreciably higher than when cupelling silver. The phenomena observed are similar to those already described, and, on its removal from the cupel, the button, having the form shown at *a* in fig. 3, is brushed, flatted (*b*) on an anvil, annealed at a red heat, and drawn out into a *fillet* (*c*) in a

Fig. 3.

small rolling-mill to about the thickness of a calling-card, in order to still further facilitate the removal of silver. After being again annealed, this is coiled into a *cornet* (*d*) between the finger and thumb. The precise manner in which the boiling in nitric acid is effected depends on the number of assays that are made. In large assay offices, as in that of the Royal Mint, a platinum boiling apparatus is now generally employed; but this is expensive, and, for smaller numbers of assays, the older method of boiling separately in 'parting' flasks is available. When adopting the former method, each cornet is placed in a small perforated platinum cup, a number of these being ranged on a tray of the same metal, which is introduced into the acid (specific gravity 1.2) contained in a boiler also of platinum. After remaining for about twenty-five minutes, the tray is removed, washed in hot distilled water, and transferred to acid of specific gravity 1.3 in a second boiler, and kept at the boiling-point for a similar period. On again being removed, the tray is washed, and raised to a red heat in the muffle, which causes the dull-red fragile cornets to cohere, assume the yellow colour of gold, and shrink in about the proportion of *d* to *e* (fig. 3). The cornets are then weighed.

In parting in a flask, the cornet is boiled for ten minutes in 2 or 3 fluid ounces of the first acid, the flask nearly filled with hot distilled water, and decanted. A similar quantity of the second acid having been added, the boiling is continued for fifteen minutes, and water again added. After decanting, and once or twice washing, the cornet is transferred to a small porous crucible, in which it is annealed at a red heat, when it is weighed.

The old method of assaying gold by the *touch*-

stone is still occasionally resorted to when an approximate estimate of the composition is desired without damaging the object. This consists in comparing the appearance of a streak made with the metal on a hard basaltic stone of dark colour, with those produced by certain *touch-needles*, the composition of which is known, after all the streaks have been subjected to the action of nitric acid. The touch-needle whose streak most nearly corresponds with that of the unknown sample is selected as corresponding with it in composition. Another convenient mode of estimating the assay of a gold-copper alloy, without in the slightest degree damaging it, is to accurately determine its density by any of the well-known methods. From this density the amount of gold present is approximately calculated as follows: Let D be the density thus obtained; W , the weight of the object; w , the weight of gold in the object; w_1 , the weight of copper; d , the density of gold = 19.3; d_1 , the density of copper = 8.6. Then

$$D = \frac{w}{d} + \frac{w_1}{d_1};$$

whence we obtain for w , the gold present,

$$w = \frac{W(Dd - dd_1)}{D(d - d_1)},$$

and assay required = $\frac{w}{W} = \frac{19.3 D - 166}{10.7 D}.$

A few words must be added as to ascertaining both the silver and gold contained in an alloy. It becomes necessary either to perform separate assays, or to subject one assay-piece to cupellation twice. The assay is first conducted without adding silver, and the resulting button weighed as though it were a silver assay. After adding silver and lead, the button is again cupelled and treated as a gold assay. The weight of gold finally obtained is deducted from that of the first button, and the difference gives the weight of silver present. Some experience is necessary in order to accurately estimate this latter metal.

The reader who requires more detailed information in regard to the above, or other assay methods, is referred to the following works: Mitchell's *Manual of Practical Assaying*; Percy's *Metallurgy*; Makins' *Manual of Metallurgy*; Balling's *Manuel de l'Essayeur*.

Assegai, a slender spear of hard wood, tipped with iron, used in battle by the South African tribes, notably the warlike Zulus. Some assegais

Various forms of Assegais.

are held in the hand and used as spears for thrusting; a shorter kind are hurled from the hand as missiles. The word, originally a Berber name, was adopted by the Moors into Arabic, and thence into Spanish and Portuguese. It was the Portuguese use of it in Africa that passed into English and French.

Assemani, (1) JOSEPH SIMON, a famous orientalist, born of a Maronite family at Tripoli, in Syria, in 1687. After completing his studies at Rome, he travelled on the pope's commission through Egypt

and Syria, collecting many oriental MSS. and coins for the Vatican Library, of which he was appointed keeper. He died at Rome, January 14, 1768. Of his numerous learned works, the most important is his *Bibliotheca orientalis Clementino-Vaticana* (4 vols. Rome, 1719-28), containing the Syrian MSS. of the Vatican. He was succeeded as keeper of the Vatican Library by his nephew, (2) STEPHEN EPHODIUS (1707-82), also a learned author of books on orientalist learning. Yet another nephew and orientalist was (3) JOSEPH ALOYSIUS (1710-82), professor at Rome.—(4) SIMON, a relative of the preceding, was born at Tripoli in 1752, filled the chair of oriental languages at Padua, and died there, April 8, 1821. One of the greatest orientalists of his time, he wrote an important work on ancient coins, *Museo cufico Naniano illustrato* (2 vols. Padua, 1787-88).

Assembly, GENERAL, in Scotland, Ireland, and the United States, denotes the highest court of the Presbyterian Church. It differs from the Anglican Convocation at once in its constitution and in its powers, representing as it does both the lay and the clerical elements in the church, and possessing legislative and judicial authority in all matters purely ecclesiastical. The General Assembly of the Established Church of Scotland consists of representatives, clerical and lay, from all the presbyteries of the church. The royal burghs of Scotland also return elders to the General Assembly of the Established Church, and each of the Scottish universities sends a representative. The Assembly meets once a year, in the middle of May, at Edinburgh, and sits for ten days. Its deliberations are presided over by a Moderator, whose election is the first step in the proceedings, after a sermon by his predecessor. In former times, this office was sometimes filled by laymen: among others, in 1567, by George Buchanan. In modern times, the moderator is always a clergyman. 84 presbyteries, composing 16 synods, return members to the General Assembly of the Established Church of Scotland. Its relation to the state is represented by a royal commissioner, who exercises no function in the Assembly beyond that of adding by his presence the sanction of the civil authority to its proceedings. The other functionaries are a principal and a deputy clerk (both clergymen), a procurator, and an agent. All business not despatched during the session is referred to a commission, with the moderator as convener, which meets immediately after the dissolution of the Assembly, and again at intervals of three months. The General Assemblies of the Free Church of Scotland, which has 16 synods comprising 73 presbyteries, and of the Irish Presbyterian Church, are similarly constituted, the principal points of difference being the representation of presbyteries only, greater legislative and judicial independence, and the absence of the royal commissioner. The General Assembly of the Presbyterian Church in the United States, representing 23 synods and 182 presbyteries, mostly in the Northern States, meets annually in May, but has no stated place of meeting. There is also a General Assembly of the Southern Presbyterian Church (67 presbyteries), and of the United and Cumberland Presbyterians; while the Reformed Presbyterian Church of the United States, like the United Presbyterian Church in Scotland, calls its supreme court the synod. See PRESBYTERIANISM, BARRIER ACT, &c.

Assembly, NATIONAL. See FRANCE.

Assembly of Divines. See WESTMINSTER.

Assen, chief town of the Dutch province of Drenthe, connected with the Zuyder Zee by canal, and with Groningen by railway, with some trade in corn and peat. Pop. (1879) 7932.

Asser, King Alfred's biographer, was a monk of St Davids (*Menevia*), who, about the year 885, was invited to the court of Alfred. Here he resided at intervals till the king's death (901), assisting him in his studies, and enjoying an affectionate confidence, of which he seems to have every way been worthy. Alfred promoted him to various dignities, and prior to 900 made him Bishop of Sherborne. He died in either 909 or 910. His life of Alfred, *De rebus gestis Alfredi Magni*, was first published, with various interpolations, in 1572, by Archbishop Parker. Its trustworthiness was questioned by Wright, but has been accepted by Pauli and Freeman. The best edition is that of Wise (1722), which is followed in Petrie's *Monumenta Hist. Brit.* (1848).

Assessment is a valuation of property, income, or profits, for the purpose of taxation, made by authorised persons according to their discretion, as opposed to a sum determined by law; or the fixing of the amount of damages, as by a jury. See **TAXES**, **DAMAGES**. For assessed taxes, see **TAXES**.

Assessors are persons sometimes associated with judicial functionaries, to assist in the argument and procedure before them, and to advise their judgments. They may be usefully employed by persons in judicial stations whose previous education and pursuits scarcely qualify them for the duties cast upon them. Assessors are usually barristers or advocates learned in the law, and familiar with judicial proceedings. By the Municipal Corporation Act, it is enacted that the burgesses shall annually elect from among those qualified to be councillors two auditors and two assessors, the former to audit the accounts of the burgh, and the latter to revise the burgess list. In the ecclesiastical law of England, a bishop, who is a spiritual judge, is assisted by his chancellor, as the episcopal assessor, and who in fact holds courts for the bishop. But in the case of a complaint against a clergyman for any ecclesiastical offence under the Church Discipline Act of 1840, the bishop is directed to inquire into the matter, assisted by three assessors, of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one, and a barrister another. In Admiralty cases the judges may command the assistance of nautical assessors. The judges of the common law courts and the Queen's counsel are, as a condition of their offices, assessors, or more properly assistants, of the House of Lords, advising the House on points of law which may be propounded to them by their lordships. In the Scottish universities, certain nominated members of the university court are called assessors.

In the United States, the term is only employed in the common sense of persons elected or appointed to determine the value of property liable to assessment.

As'sets (Norman-French *asez*, 'enough,' from late Lat. *ad satis*, 'to sufficiency'), a term signifying the property of a deceased person which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate, and without any debts to be paid. In general acceptance, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or to a trading association.

Assets are either *personal* or *real*, the former comprehending such goods, chattels, and debts as devolve on the executor; and the latter including

all real estate, whether devised or descending to the heir at law. In connection with this distinction, assets are also said to be *assets by descent*, and *assets in hand*, the former of these being recoverable from the heir to whom the land descends, and so far as such lands will extend—assets in hand, again, signifying such property as a person leaves to his executors sufficient for the clearing of burdens and bequests affecting his personal estate. Assets are also in their nature either *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. Where there are several creditors of equal degree, the executor is bound to pay him who first obtains judgment for his debt; and he cannot resist on the ground that nothing will be left for the other creditors. If, after exhausting the whole assets which have come to his hands, by the payment of debts in due order, he be afterwards sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or technically by a plea of *plene administravit*; and upon this plea the creditor is entitled to judgment that he shall be paid out of any other assets that shall come to the defendants—which is called a judgment of assets *in futuro*.

Assets is not a law term in Scotland, but it is nevertheless much used in the business of that country.

In the United States, the assets are broken up into several funds, and where some of the creditors can resort to two or more funds, while others can legally only resort to one, a court of equity will, by 'marshalling assets,' compel the more fortunate creditors to exhaust the fund first upon which they have the exclusive claim; or, if they have been satisfied from the general fund, to permit others to stand in their place as to the exclusive fund, that so an equitable division of assets may be made among all the creditors.

Assid'ians. See **CHASIDIM**.

Assien'to (Span., 'contract'), a word specially applied to a contract between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. Charles V. first formed such a compact with the Flemings; and similar ones were entered into with the Genoese (1580), with the French Guinea Company (1702), and with England (1713). The British government made over its privilege to the South Sea Company for thirty years, permission being also granted to send yearly a ship, carrying 500 tons of goods, to the Spanish colonies. The misunderstandings arising hence contributed not a little to the war that broke out between the two nations in 1739. At the peace of Aix-la-Chapelle in 1748, the English company having still four years to run, their rights were guaranteed to them; but they relinquished them at the Madrid Convention of 1750, upon the payment of £100,000, and the concession of certain commercial advantages.

Assign is a legal term used in both English and Scottish law to indicate generally the transfer of property, but more particularly the transfer of movable property and personal rights. The word is also applied to the persons to whom the transfer is made. Very often, however, the word, when used—e.g. in a deed of transfer to A. B. and his assigns—is mere surplusage, because it includes everybody who takes from A. B., and the transfer to A. B. implies that he has the power of transferring to his assigns.

Assignment is a form in Scots conveyancing, analogous to the English word Assignment (q.v.),

by means of which the holder of any right, or the creditor in any obligation, or the proprietor of any subject not properly feudal (see FEUDAL SYSTEM), transfers his right or estate to another. The party making the assignation is called the *cedent*, and the party in whose favour the assignation is made is called the *assignee* or *cessionary*, words which are derived from the French law. In the case of debts, there was originally no power in the creditor to assign his right, and, accordingly, the form of assignation still shows that the transaction was regarded as one of mandate to recover the money for the creditor. Now, however, it is recognised that, unless the assignation be in security, the whole right of the creditor is transferred to the assignee, who comes exactly in place of his author. It follows that the debtor can state against the assignee any defences (such as set-off) which, at the date of the assignation, he might have stated against the creditor; but the assignee, on the other hand, is not affected by any latent trust or agreement between the debtor and other parties. In order, however, to complete the assignation, it must be *intimated* to the common debtor—that is, the party originally indebted to the cedent—and so essential is this intimation, that in the case of competing claims against the right, interest, or estate assigned, the assignation first intimated will be preferred to one prior in date, but posterior in the date of intimation. Such intimation ought to be made by a *Notary Public* (q.v.), but other formal notices of the assignation have been admitted, as in the General Clauses Act, relating to railways and other companies, and in the Transmission of Movables Act, 1862. Between the parties, of course, mere private knowledge on the part of the debtor is sufficient, but this will not give a preference in a competition. But there are certain assignations which require no intimation, such as adjudication and other judicial assignations, marriages contracted before 1881, which are legal assignations of the wife's movable estate to the husband, and the statutory conveyance to a trustee in bankruptcy. The assignation of a debt implies and warrants that the debt is due, but not that the debtor is solvent. Bills and notes, though documents of debt, do not require assignation, but pass, by indorsation, without notice. Bonds, policies of assurance, protests of bills, &c. are generally, in Scotland, assigned according to certain short forms provided by statute in 1862. Special statutory provision is made for the assignation of such movable rights as patents, copyrights, and registered ships. Personal rights to land are also the subject of assignation, and every conveyance of land contains one clause assigning the rents, and another assigning the writs—that is, the title. In Scottish agricultural leases, assignees are generally excluded expressly.

Assignats. After appropriating to national purposes the land belonging to the church, the French National Assembly, instead of bringing it into the market at a time of insecurity, when its value was depreciated, issued bonds on the security of it, which were called *assignats*, as representing land assigned to the holder. This paper-money consisted chiefly of notes for 100 francs (£4) each, though many of them were for lower sums; and the first issue, in 1790, amounted to 400 million francs. The system relieved the government; 'the assignats saved the revolution' for the time being. The facility of this plan of providing government income led to its being repeatedly had recourse to, as the property of wealthy emigrés was confiscated, till the amount rose to the enormous sum of 45,578 million francs, besides great numbers of forged notes—for the assignats were easily counterfeited. The value of the assignats naturally

soon began to decline, and confidence once gone, the declension became fearful. In June 1793, one franc in silver was worth three francs in paper; in August it was worth six. The state took the most extreme measures to compel the acceptance of these notes at their full nominal value. The effects of these were to cause the assignats to flow back into the public treasury, to raise the prices of all commodities, and to make every one averse to have any dealings with the state. All business became disorganised. At last the value of assignats sank almost to *nil*. Millions had suffered incalculable loss, and only a few who had bought public lands with the assignats that cost them little or nothing, had enriched themselves at the expense of the community. In March 1796, a louis d'or (24 francs) bought 7200 francs in assignats. After this, they were withdrawn from the currency, and redeemed at a thirtieth of their nominal value, by 'territorial mandates,' a new kind of paper-money, which enabled the holder at once to take possession of public lands at the estimated value, while assignats could only be offered at a sale. The *mandats* also soon fell to a seventieth of their nominal value, and were returned to government in payment of taxes or of land. The disastrous system of compulsory paper-credit came to an end early in 1797.

Assignee in Bankruptcy, one of the persons officially appointed to manage a bankrupt estate for the benefit of the creditors, now called *trustee*. See BANKRUPTCY.

Assignment, in the law of England, is the name given to a conveyance by which the party making the assignment transfers or grants over a right not in possession, such as a bond, a debt, or other *Chose in action* (q.v.). In England, according to the strict rule of the old common law, no such right could be assigned or granted over, because such a proceeding was thought to be an encouragement to litigation. The only exception to this general rule was in the case of the crown, which might always either grant or receive a *chose in action* by assignment. Now, however, the proceeding is in constant practice. The courts of equity used to make the rule itself give way to the expediency of facilitating the transfer of property by directly sanctioning the practice; and even in those of common law the application of the ancient principle was evaded. The Judicature Act, 1873, provides for the assignment of *chores in action* by writing; notice of the assignment must be given to the debtor. Mortgages may be assigned; indeed the right to make such a transfer is one of the properties of a mortgage security. Assignment is also the proper mode of assurance or conveyance for passing estates in reversion; and for passing leasehold estates for years, and other chattel property. The Statute of Frauds requires the assignment of a lease, or of a trust, to be made in writing; and the Real Property Amendment Act, 1845, provides that the assignment of a chattel interest in land (not being copyhold) shall be made by deed, unless the interest is one which might by law have been created without writing (as, for example, a lease for less than three years at a rack-rent). Copyright is assignable; indeed, by the 5 and 6 Vict. chap. 45, sect. 3, copyright is expressly given to the author and his assigns; but it is not required, like a patent right, to be in every case under the seal of the proprietor, it being enacted by section 13 of the same act that an assignment properly entered in the book of registry at Stationers' Hall shall be as effectual as if made by deed.

In regard to the right of assignment generally, it may be laid down that the property in things personal is transferable with absolute freedom; and if

they are assigned under a condition which is either repugnant to the gift itself, or against the policy of the law—such as a prohibition to dispose of the property assigned—the condition is void. There are some cases, however, where the right of alienation is, in respect of the incapacity of the owner, suspended; as to which it will be sufficient to remark that the law with respect to the disability of infants, insane persons, and persons under duress, applies in general to personal as well as to real property. A married woman, too, was at common law under an absolute incapacity to make any transfer of things personal; with the exception of her equitable interest in property settled in trust expressly for her separate use, the goods and chattels which she possessed at the time of marriage, or subsequently acquired, belonged, by the general rule of law, to her husband. But the Married Women's Property Acts have given to married women almost all the rights of disposition enjoyed by single women. There are also some few cases where, in respect of the nature of the interest itself, its alienation is absolutely prohibited. Thus, generally, the pay or half-pay of a military or naval officer, or the salary of an office of trust, is, on a principle of public policy, not assignable, the object being to secure to such persons, even against their own improvidence, the possession of those means which are essential to the maintenance of their station and the performance of their duties. The sale or transfer of public appointments themselves is also, in general, contrary to the policy of the law, and in most cases expressly prohibited. See Stephen's *Commentaries*, Book II. chap. iv.

An assignment of goods and chattels is frequently made by a Bill of Sale (q.v.). Bills of Exchange (q.v.) and Promissory Notes (q.v.) are assigned by indorsement.

The corresponding term in the Scotch law is *Assignment* (q.v.). But in that system, assignment is the legal and technical word for the transference of property in copyrights, patents, and registered vessels.

In the United States, assignment is of broader signification; it applies also to the transfer of real property by certain conveyance. In general, every right of property, real or personal, and every demand connected with a right of property, real or personal; and all *choses in action*, as bonds, notes, judgments, mortgages, debts, contracts, agreements, relating both to real and personal property, are assignable, and the assignment thereof will pass to the assignee a right of action in the name of such assignee against all parties liable to an action. Assignment carries with it all collateral securities held by the assignor for the collection of a debt or the fulfilment of a contract, and is subject to all the equities and charges which attached in the hands of the assignor. A personal trust, as the right of a master in his indentured apprentice, or the duties of a testamentary guardian, or the office of executor, trustee, &c., is not assignable. The validity of an assignment must be determined by the law of the state in which it was made, provided the thing assigned is subject of municipal or state law; but copyrights, patents, and government claims are governed by acts of congress. In general, assignments should be recorded in the office prescribed by law, or are void as against those claiming under subsequent assignments.

Assignment of Error. See ERROR and APPEAL.

Assigns, or in Scots law, ASSIGNEES, is the legal name given to parties in whose favour an Assignment or Assignment (q.v.) is made.

Assimilation is the process by which living organisms absorb nutriment and convert it into

part of their own substance, solid or liquid. See NUTRITION.

Assiniboia, a Canadian district or territory within the limits of the North-west Territories, but formed by an order in Council in 1882. It lies to the west of Manitoba, is bounded on the south by the United States frontier, west (at 111° W.) by Alberta territory, north (at 52° N.) by the new territory of Saskatchewan. It has an area of about 95,000 sq. m.; is intersected by the Canadian Pacific Railway, by the Qu'appelle, South Saskatchewan, and Souris rivers; and contains the towns of Regina (the capital of the North-west) and Fort Pelly. The rich soil of the Qu'appelle Valley and other portions is especially suitable for wheat-growing. The climate is subject to extremes, ranging from 58° F. below zero in winter, to 106° above it in summer.

Assiniboine, a river of British North America, rising in 51° 40' N. lat., and 105° E. long. At Winnipeg it joins the Red River (q.v.), which discharges its waters into Lake Winnipeg. At a point 140 miles from its mouth, the Assiniboine is 230 feet broad, and its mean depth over 8 feet; its course measures about 400 miles. Its tributaries are the Little Souris, Qu'appelle, Rapid River or Little Saskatchewan, White Sand River, and Beaver Creek. The river gives name to a tribe of Indians, and to the district of Assiniboia of the North-west Territories. There is steam communication between Winnipeg and Fort Ellice, a decayed post of the Hudson Bay Company, about 700 miles distant. Here the great North-western trail crosses the Assiniboine by a rude rope-ferry.

Assisi, a town of Central Italy, picturesquely situated on a steep hill, 14 miles S.E. of Perugia by rail. It is surrounded by walls, and overhung by a lofty citadel in ruins. It is the birthplace of St Francis, who founded here in 1209 the mendicant order that bears his name. The monastery, one of the earliest specimens of Gothic architecture in Italy, was built in 1229. It has two Gothic churches, one surmounting the other, with frescoes and paintings by Cimabue, Giotto, and other masters; beneath, in a Doric crypt (1818), are the relics of St Francis. Assisi also possesses a cathedral of San Rufino and a church of Santa Maria, the latter built out of a temple of Minerva. Pop. (1881) 3705.

Assize. This word, literally signifying a 'sitting' or 'session,' is a term used in the principal European legal systems, and very much in the same senses in all. As is common with regard to most of our ancient legal technicality, the Latin language, in the first instance (*assideo*), and then the French (*assis*), appears to have led to its introduction into the phraseology of the law of England, and, it may be added, also of Scotland, although in the latter country it has a more limited application in judicial procedure than in England, *assize* being in Scotland the old technical expression for a jury. In England, this word may also signify a jury, and it is sometimes used to denote an ordinance, decree, or law. But in modern practice, it is commonly applied to the sessions or sittings of the judges of the superior law-courts, held periodically in each county, for the purpose of administering civil and criminal justice. These courts came into use in room of ancient justices in eyre, *justiciarii itinere*. The Statute of *Nisi Prius*, in the time of Edward I., gave a general jurisdiction in civil business to the judges acting in land disputes under the Assize of Northampton in 1176. They are now appointed by commissions issued twice a year to the judges of the High Court of Justice, two judges being generally assigned to each circuit. These commissioners or judges of assize are sent twice in

every year on *circuits* all round the kingdom to make inquiry into crimes committed in certain counties, and to hear and determine the same according to law, or to try certain civil and criminal cases which are ready for trial; and occasionally a third circuit is appointed in the course of the year, for the purpose of jail delivery. The circuits (formerly eight) are, since 1875, seven in number—Northern, North-eastern, Midland, South-eastern, Oxford, Western, and North and South Wales; and in going them, the judges or commissioners sit by virtue of four several authorities: (1) The commission of the *peace*, which is much the same as No. 2; (2) A commission of *oyer and terminer*, which applies to cases where the indictment is found before the commissioners; (3) A commission of general *jail* delivery, which enables them to try all persons in prison or on bail. The other authority is (4) that of *nisi prius*, which empowers them to try all questions of fact issuing out of the courts at Westminster that are then ripe for trial by jury. These, by the ancient course of the courts, were usually appointed to be tried at Westminster in some Easter or Michaelmas term, by a jury returned from the county wherein the cause of action arose; but with this proviso, *nisi prius*, unless before the day fixed the judges should come into the county in question, which in modern times they have invariably done in the vacations preceding; so that the trial has always, in fact, taken place before these judges. And now the trial is allowed to take place without the use of any such words in the process of the court, and as a matter of course, before the judges sent under commission into the several counties. The circuit system, however, does not extend to London and Middlesex, which have instead courts of *nisi prius*, which are held before the chief or other judge of the superior courts for the trial of civil causes, at what are called the London and Westminster Sittings; and the establishment of the Central Criminal Court has sufficiently provided for the administration of criminal justice within these districts.

The circuit courts of Justiciary in Scotland very much resemble the assizes in England, and have, in criminal matters, very much the same jurisdiction; but in civil causes their authority is practically limited to the hearing of appeals from the Small Debt Courts, although civil trials by jury in the Court of Session are occasionally set down for circuit. Scotland is divided into three circuits, the North, South, and West. Formerly there were only two courts held in the year, with an additional court at Glasgow. In 1882 it was found necessary, by Act of Adjournment following on Order of Privy-council, to provide for three additional courts in Glasgow, and two additional at Perth, Dundee, and Aberdeen.

In the sense of an ordinance or law, the term *assize* has various applications, although chiefly in the more ancient systems of jurisprudence. Thus, the 'Assizes' of Jerusalem were a code of feudal laws for the kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons and of the clergy and laity under Godfrey of Bouillon. Then there were in England the Assize of Bread, the Assize of the Forest, the Assize of Clarendon. The word was often applied to particular action connected with land. In the criminal procedure of Scotland, the word *assize* was until recently the only technical term for the jury, and is still used in that sense. See JURY TRIAL.

Assmannshausen, a village on the Rhine, 3 miles below Rüdeshheim, famous for the red and white wine which is produced on the slate-mountains in its vicinity. The red wine resembles Burgundy, and possesses a rare aromatic flavour. The choicest sort, which is preferred by connoisseurs to

all the other red wines of the Rhine, is cultivated in the ducal vineyards at Wiesbaden.

Associate Synod, ASSOCIATE PRESBYTERY, designations formerly adopted among certain dissenters from the Church of Scotland. See UNITED PRESBYTERIAN CHURCH.

Association. See CO-OPERATION; also, SOCIETIES, LEAGUE, COMPANY.

Association of Ideas. This is a phrase of great importance in the Philosophy of the Human Mind, as expressing, according to an important school of modern thinkers, the most pervading fact at the foundation of our intelligence. What is meant by Association of Ideas, may be thus illustrated: When we see the sky becoming overcast, we think of rain as about to follow, the notion of rain not having previously been present to our mind. When we hear the church-bells, we are apt to think of the crowds in the street, or of some of the other circumstances of public worship. When we pass a house, we are reminded of its occupier; and meeting a person we know, we may be carried in thought to his office, and from that to other persons holding the same office, and so on. If an object is before our eyes, as a mountain, we are said to receive an impression or sensation of it, in consequence of the actual presence of the thing; but it is possible for us to remember the mountain, or to have an idea of it, when far away from the reality, in which case there must be some power in the mind itself, different from the susceptibility to present objects, a power of retaining, reviving, or resuscitating those states at first induced by contact with the actual. Besides the sights, and sounds, and touches caused by contact with real things, we are greatly occupied with sights, sounds, and touches remembered, anticipated, or imagined, which is to live in a world of ideas; and it is in this world that the process termed Association has its sphere. The association between names and things comprehends one of the most extensive applications of the power in question.

The circumstances under which one idea brings forward another into the view are principally these two—viz. first, previous *proximity*; and second, *likeness*. The terms 'Contiguity' and 'Similarity' may be used to express them. The first is exemplified in the cases of association given above; for in most of those it will be found that the conjoined notions have been frequently in the view at the same time, in consequence of which they have, as it were, grown together, or become part of the same whole. Thus, we have often noticed the darkened sky followed by a shower; the two facts have occupied the attention simultaneously, and in virtue of some power belonging to our mental framework, they have cohered into an inseparable couple or aggregate in the mind. This is proximity, or contiguity. When one idea suggests another which was never in company with it before, it is generally through the force of some *likeness* between the two. We meet an old man in the street with a very peculiar face, which reminds us of the bust of Socrates. These two things had never accompanied one another in our mind before, and therefore it could not be the force of proximity that made the second to arise at the instigation of the first; but there was a certain amount of likeness between the old man's features and those of Socrates. Identification and comparison both imply that things are brought together by virtue of their similarity. The principle of proximity operates most in Memory, Habit, and Routine; similarity has to do with invention and originality, and is essential to the processes of Reason and Imagination.

Law of Contiguity.—The principle of association by proximity is not confined to ideas. Our mechanical habits are formed through the very same power of our constitution that enables us to recall or remember ideas. The taught movements of a soldier or of a skilled workman are connected together so firmly that one succeeds to another almost of its own accord. Everything of the nature of acquisition supposes a plastic property in the human system, giving permanent coherence to acts that have been performed together.

The following is a general statement of the law under consideration: Actions, Sensations, States of Feeling, and Ideas, occurring together, or in close succession, tend to grow together, or cohere in such a way that when any one of them is afterwards presented to the mind, the others are apt to arise.

And first, as to association of Actions, or voluntary movements. When we perform a train of movements without any further aid of the will than to commence the series, there must be a fixed connection between each and the one that follows, and this connection may be either instinctive or acquired. There are various cases of instinctive trains, such as the action of the heart, lungs, and intestines, and the movements of deglutition. When a morsel of food reaches the back part of the mouth, the muscles of the throat seize hold of it, and transmit it to the stomach, independent of our will. The connected movements in this case are provided for in the original structure of the nervous and muscular system. In walking, there is partly an instinctive tendency to alternate the limbs, and partly a confirming acquisition, the result of practice. But in those complicated operations that human beings are taught to execute in the various avocations of life, the associating principle is everything. The apparently simple and easy act of taking food is a complicated acquisition; in other words, an extensive group of associated movements, originally built up by slow degrees. A good example of the association of movements is furnished in our acquirement of spoken language, as in committing to memory words, sayings, and passages of books.

When we proceed to Sensations and the Ideas, or subsequent traces, of Sensations, and take along with these the variety of our movements with their ideas, we find an unlimited scope for the associating principle. In the various mechanical acquirements, which include the whole of special handicraft industry and skill, as well as the use of the bodily members in the more general actions of daily life, there may be traced the linkings of actions with actions, or actions with sensations and ideas. The workman fabricating in wood, metal, or stone, acquires a firm connection between each aspect of the material and the muscular power to be applied to bring it one step nearer the desired form. The power of copying anything we see, as in writing, drawing, moulding, &c., when completely mastered, is made up of associations between a visible appearance, and the train of movements calculated to reproduce it. After practice, all this is done, as it is called, mechanically, or without those operations of considering, willing, and remembering directions, that are essential to the learner in a new art. In the greater number of crafts, the eye is the guiding sense to the operator, but not in all. Sometimes it is the ear, as in music. In other arts, the touch is the guiding sense, and in some, as in cookery, the taste and smell direct the operator. Each accomplished workman has in his mind many hundreds, not to say thousands, of couples or aggregates of definite movements with other movements and with sensations, contracted in the course of his apprenticeship to his calling.

If we inquire into the circumstances that favour and promote this extensive circle of acquisitions, we shall find in the first place, a natural activity of temperament to be a good basis of bodily acquirements. Another important circumstance is the acuteness or delicacy of the sense involved in the operation. The third consideration is the natural power of adhesive association belonging to the individual character. The fourth principal circumstance is the interest taken in the work, or the degree to which it engages the feelings of the learner.

A detailed exemplification of this great principle of our nature might be given through all the departments of the human intellect. The acquirements of speech, as already said, contain a wide range of instances. The adhesion of language is partly in the vocal organs, partly in the ear, and partly in the eye, when we come to written and printed characters. The associations of names with things, with actions (as in obeying direction and command), and with other names (in acquiring foreign languages), are a gradual growth favoured by such conditions as the above. The acquirements in Science, Fine Art, and Business, and in everything that constitutes skill or knowledge, proceed upon this plastic property of the mind. It also enlarges the sphere of our pleasures and pains. There are connections established in the mind between our states of feeling and the things that have often accompanied them, so that the accompaniment shall have power to revive the feeling. It is thus that we contract affections, both benevolent and malevolent, towards persons and things, our friends, our home, our country, our property, our pursuits.

Law of Similarity.—This may be expressed as follows: *Present Actions, Sensations, Thoughts, and Emotions* tend to revive their like among *previous impressions*.

If the mind worked only by the principle of contiguity, nothing would ever occur to us except in some connection already formed. But some explanation is necessary as to the precise relationship subsisting between the two distinct forces of mental resuscitation, in order to show at once their distinctness and their connection. When the cohesive link between any two contiguous actions, sensations, or ideas is confirmed by a new occurrence or repetition, it is perfectly obvious that the present impression must revive the sum-total of the past impressions, or reinstate the whole mental condition left on the occasion immediately preceding. Thus, if we are disciplining ourselves in the act of drawing a round figure with the hand, any present effort must recall the state of the muscular and nervous action, or the precise bent acquired at the end of the previous effort, while that effort had to restore the condition at the end of the one preceding, and so on. But this reinstatement of a former condition by a present act of the same kind, is really and truly a case of the principle before us, or of like recalling like; and without such recall, the progressive adhesion of contiguous things would be impossible. It would appear, therefore, that similarity is tacitly assumed in the operation of contiguity, and is indispensable to the process by which our acquisitions are gradually built up. Why, then, do we set up the associating force of likeness as something independent and distinct? To answer this question, we must advert to the fact that in those cases where the same impression is deepened by every new repetition, the old and the new are not merely similar, they are *identical*. and the resuscitation takes place without fail, and as a matter of course. But in going deeper into the explanation of the human intellect, we encounter many classes of similars, where there is not absolute identity, but the mixing up of a certain amount of *diversity* with the likeness actually existing. The botanist classing

together all the plants of the same order, as, for example, the *Rosaceæ*, has to be struck with the occurrence of certain common characters—viz. the properties that distinguish the order—in the midst of great varieties in all other respects. It is exceedingly important in science, in the business of life, and even in the creations of fine art, that the mind should take cognisance of likeness surrounded by unlikeness; which is the case that renders it necessary to characterise as distinct the associating force now under discussion. In the case of perfect identity between a present and a past impression, the past is recovered, and fused with the present, instantaneously and surely. So quick and certain is the process that we lose sight of it altogether; we are scarcely made aware of the existence of an associating link of similarity under such circumstances. But when we pass from perfect to imperfect or partial identity, we are more readily led to perceive the existence of this link of attraction between similars, for we find that the restoration sometimes does not take place. When in some new presentation of an object, the old familiar form is muffled, obscured, distorted, disguised, or in any way altered, it is just a chance if we recognise it.

The intellectual operations known under the names Classification, Generalisation, Induction, and Deduction, all proceed upon the discovery of likeness among things lying wide asunder in space and time, and very often veiled by diversity. Thus, in order to include in one list all the species of the *rose*, botanists have had to trace the characters of the genus through its various members, wherever they occur, and under the greatest differences in every other respect. It takes a keen identifying faculty—i.e. a strong natural tendency for the resurrection of like to meet like—to see the resemblance of some of these species to the rest. So in the process termed *induction*, by which a general law is arrived at by comparing instances of it everywhere, there must be an attraction of similars, in order to bring together in the mind the collection of particulars that the induction is based upon. Many of the greatest discoveries in science have turned on the identification of modes of action never before supposed the same, as when Franklin was struck with the resemblance between the atmospheric thunder and lightning and the phenomena of common electricity.

Another wide field for the operation of the same principle is the region of *illustrative comparisons*, whereby two things widely remote are brought together, in the view either to elucidate one another, or for the sake of ornament and poetic effect. Most men of genius in literature and poetry have contributed original illustrations, similes, metaphors, or comparisons in the course of their compositions. A mathematician is the most likely person to bring up comparisons from mathematics; a botanist is prepared to identify plants; a travelled man provides illustrations from foreign countries; a historian, from history. The sailor is notoriously rich in nautical similes and illustrations. When any one not specially versed in a subject is yet prone to draw upon it profusely in the way of comparison, we must then refer to great natural endowment as the sole explanation. (For the full treatment of this subject, see Bain on *The Senses and the Intellect*; Hamilton's *Reid*; Mill, in his *Examination of Hamilton*; and the works of Herbert Spencer.)

The earliest known attempt to lay down the laws whereby thought succeeds to thought, is that contained in Aristotle's treatise on Memory. He enumerates three different principles of mental resuscitation—viz. Similarity, Contrariety, and Coadjacency. He has in this been followed by most other philosophers; but it is now generally

admitted that contrariety is not an independent associating force. When a thing suggests its opposite or contrary, it will be found that the two have been previously together in the mind, and have therefore acquired a mutual hold by contiguity. Contraries (black and white, health and sickness) have a natural inseparability; they are of the class of relatives like father and son, which imply each other necessarily, and have no meaning except by mutual reference. It requires no new principle of our constitution to account for suggestion in this particular case.

Hobbes recognised the principle of contiguity as the foundation of reminiscence; but the Aristotelian philosopher, Vives, who wrote in the 14th century, was the first to specify in minute detail the various circumstances that determine the adhesive bond of recollection. Hume enumerated resemblance, contiguity, and causation. Causation, however, is merely a case of contiguity; so also we may say of Order in Place, and Order in Time, which have been given as distinct principles.

ASSOCIATIONIST SCHOOL is a name for those psychologists who seek to explain all mental acquirements, and the most complicated intellectual processes, by laws substantially similar to those that determine simple reproduction—by association of ideas. Their position is, of course, strenuously denied by other schools of thought, including especially Kantians and what is often called the *a priori* school, who affirm that association in the widest sense of the word is inadequate to explain many fundamentally distinct mental processes. The term Association of Ideas was first used by Locke, but in a very limited reference; the most notable representatives of the Associationist School, which is almost exclusively English, are Hobbes, Hume, Hartley, Priestley, James Mill, Professor Bain, Herbert Spencer, and, in France, Condillac. Associationists differ a good deal amongst themselves—some, like Hartley, taking account only of contiguity, Spencer almost solely of similarity, and some insisting on contrast as a distinct principle. The preceding article, positing only two principles, represents Professor Bain's view. Herbert Spencer has moulded his form of the doctrine by his theory of evolution.

Assolzie ('assoil,' 'absolve'), a Scots law term used in criminal cases, meaning 'to acquit.'

Assolant, ALFRED, French author, was born in 1827 at Aubusson, Creuse, and became a teacher in Paris. In 1852 he visited the United States, and on his return published some brilliant sketches, as *Scènes de la Vie des Etats-Unis* (1859). From his pen now came a long series of tales and novels, including *Branças* (1859), *Marcomir*, *Gabrielle de Chênevert*, *Les Aventures du Capitaine Corcoran*, *François Buchamor*, *Pendragon* (1881). He was equally notable as a sarcastic and powerful journalist and political writer, bitterly assailing the empire and the opportunist republican government. He died in May 1886.

Assonance, in Prosody, is the correspondence of sound pronounced by a reiteration of the same accented vowel with different consonants, as in *nice* and *night*, *war* and *fall*, *mate* and *shape*, *feel* and *need*. It is a kind of imperfect rhyme, or rather a substitute for rhyme, and is especially common in Spanish poetry. All the old French poetry also was marked by assonance, not rhyme. 'The rule of assonance,' says Marsh, 'requires the repetition of the same vowels in the assonant words, from the last accented vowel inclusive. Thus *man* and *hat*, *nation* and *traitor*, *penitent* and *reticence*, are assonant couples of words of one, two, and three syllables respectively.' In Spanish verse the assonance is generally introduced only in alternate verses or the

second of each couplet. Assonant or vowel rhymes occur frequently in modern English poetry.

Assos, a ruined town on the Gulf of Edremid, from the still imposing remains of which the successful excavations, in 1881-83, of the American Institute of Archaeology have brought to light the agora, with senate-house and colonnade, a bath, theatre, gymnasium, statues of heroes, and seven Christian churches.

Assouan (also *Eswan*; the ancient *Syene*) is the southernmost city of Egypt proper, on the right bank of the Nile, and beside the first or lowest cataract. Near are the islands of Philæ and Elephantine. On the left bank are catacombs. There are some remains of the ancient city, as granite columns and part of a temple. In the neighbourhood are the famous granite quarries from which so many of the huge obelisks and colossal statues were cut to adorn the temples and palaces of ancient Egypt. From Syene, this kind of granite came to be known as *Syenite*. Pop. about 4000.

Assumpsit. In the English Courts of Common Law, a plaintiff might, in old time, fail to obtain justice if he could not bring his claim within one of the customary forms of action. The clerks in Chancery were therefore empowered by statute in 1285 to frame new writs 'on the case,' where the cause of action was in the nature of trespass. One of the new forms devised by the clerks was the action of *assumpsit*, wherein the plaintiff asserted that the defendant undertook (*assumpsit*) to do a certain act, and failed to fulfil his promise. Though in form an action for trespass, *assumpsit* was really an action arising out of contract; and it was extensively used in commercial and other cases. The Common Law Procedure Act, 1852, did away with the old forms of writ, and under the Judicature Acts all actions are now commenced by a writ of summons.

In the United States, *assumpsit* is the most common form of action. It is defined to be an action for the recovery of damages for the breach of a parol or simple contract; but in reality it is the form of action generally used for the recovery of any debt, or for the recovery of money in the hands of the defendant which in justice and equity belongs to the plaintiff. The essential is that there should be a privity of contract between the parties, either express or implied. The plaintiff may neglect the contract or waive a tort, and sue in general *assumpsit*, but generally a special agreement implies a special *assumpsit*; in the latter case, however, the promise must be proved. *Assumpsit* has in most of the older states by statute superseded all the common law forms of action. It is based upon the general equitable idea that what one ought to do he has assumed or promised or undertaken to do, and being equitable in its nature, takes the place of all other civil actions in those states in which the difference between equity and law has been abolished in practice, and but one form of civil action is recognised by statute.

Assumption, capital of Paraguay. See ASUNCION.

Assumption of the Virgin, a church festival instituted at the beginning of the 7th century in the East, and of the 9th in the West. In the 3d or 4th century we first meet with a Gnostic or Collyridian tradition, that, after the death of Mary, her soul and body were taken up to heaven by Christ and his angels. That legend was condemned by Pope Gelasius (494 A.D.), but, through a series of successful forgeries, it was fathered on SS. John, Athanasius, Augustine, and others, and by 590 was accepted as true by

Gregory of Tours. The festival is kept on the 15th of August.

Assurance. See INSURANCE.

Assurance, COMMON, is described by Blackstone as the legal evidence of the translation of property, whereby every man's estate is assured to him, and all controversies, doubts, and difficulties are either prevented or removed. For an account of these common assurances or *conveyances*, as they are generally termed, see DEED, and CONVEYANCE.

Assynt, LOCH, a beautiful fresh-water lake of South-west Sutherland, 6½ miles E. of Lochinver. Lying 215 feet above sea-level, it has an extreme length and breadth of 6½ miles and ½ mile. To the north of it rises Quinag (2653 feet); to the east, Benmore Assynt (3273); to the south, Canisp (2779) and Suilven (2399). To Ardvreck Castle, on a north-eastern promontory, the great Marquis of Montrose was brought a prisoner in 1650.

Assyria (called *Assur* in the Assyrian inscriptions, *Athura* in the Persian, and *Assura* in the Median) was the northernmost of the three great countries that occupied the Mesopotamian plain. It was bounded on the N. by the Niphates Mountains of Armenia; on the S. by Susiana and Babylonia; on the E. by Media; and on the W., according to some, by the Tigris, but more correctly by the watershed of the Euphrates, for many Assyrian ruins are found to the west of the Tigris. It was thus about 280 miles long from N. to S., and rather more than 150 broad from E. to W. This plain is diversified by mountain-chains on the north and east, and watered by the Tigris and its affluents, between two of which—the Zab rivers—lay the finest part of the country, called *Adiabene*. As it was the boundary-land between the Semitic people and Iran, it became the scene of important political events. Its extraordinary fertility enabled it to support a large population. The high degree of prosperity and civilisation reached by its inhabitants in very early times is attested not only by ancient writers, but by the extensive ruins of mighty cities, by the canals and contrivances for irrigation, and by the numerous proofs—furnished by recent excavations—of an acquaintance with the arts and sciences. The ruins of many cities are grouped around Nineveh; while lower down, the Tigris exhibits an almost unbroken line of ruins from Tekrit to Bagdad. Under the Mohammedans this fine country is now almost a desert.

History.—Ancient authorities differ widely from each other respecting the rise and progress, the extent and the duration, of the Assyrian empire. Berosus, a Greco-Chaldean priest at Babylon, who wrote about 288 B.C., and Herodotus, who there is strong reason to suspect did not visit Babylonia, as he claims to have done, differ widely from Ctesias of Knidos, who was court-physician to the Persian king Artaxerxes Mnemon (405 B.C.); the latter, no doubt, writing from distorted Persian sources, Herodotus from the reports of Greco-Egyptian and Phœnician dragomans. Berosus, who was a member of the caste of Chaldean scribes, and able to read the inscribed records in the Babylonian libraries, has hitherto met with very strong confirmation from the inscriptions.

In the Bible narrative we are told that Nineveh was founded from Babylonia—'Out of that land (Babylonia) he (Nimrod) went forth into Assyria' (Gen. x. 11)—and this statement is fully confirmed by the results of recent explorations. The earliest inscriptions found on the bricks from Assur (*Kilek-Shergat*), the ancient capital, give to the first rulers of the land the Akkadian title of *Patesi* or 'high-priest of the city of Assur,' and to the city itself the Akkadian name of *Pal-bi-ki*. The next notice of Assyria does not occur until the Assyrian

king Pul or Tiglath-pileser II. invaded Palestine, and was bought off by Menahem, king of Israel (738 B.C.). In the same reign we find the Jewish king Jehoshaphat (Ahaz) becoming a vassal of the court of Assyria, and the tribes beyond Jordan carried away captive (734 B.C.). In 722 B.C. Samaria is captured by Sargon 'the Tartan,' who had usurped the throne from his weak master, Shalmaneser IV. The next reference to Assyria is that of the siege and capture of Jerusalem by Sargon (Isaiah, x. xi. xx.), and the siege of Ashdod (712-11 B.C.). This event is now proved to be distinct from the siege by Sennacherib in 701 B.C., which terminated apparently in a disaster for the Assyrian army. The last mention of Assyria is the record of the murder of Sennacherib by his sons in 681 B.C., and the accession of his faithful son Esar-haddon, the most powerful of all the Assyrian monarchs, for he carried his arms as far as the Mediterranean and conquered Egypt. Little credit is to be attached to the expedition of Holofernes recorded in the Book of Judith.

After this the empire appears to have gradually decayed, until at last, in the reign of Assur-bani-pal or Sardanapalus, or that of Esar-haddon II. (Sarakos), a league for its destruction was formed between Nabopolassar, governor of Babylon, and Cyaxares, king of Media, which was strengthened by the marriage of Nebuchadnezzar, son of the former, to Nitocris, daughter of the latter. The war and siege are said to have been interrupted by an invasion of the Scythians, which drew off Cyaxares; but at length Nineveh was taken and destroyed about 605 B.C., or, according to Rawlinson, 625. In the time of Darius Hystaspes, Assyria rebelled without success in conjunction with Media. In the time of Herodotus, the capital had ceased to exist; and when Xenophon passed it, the very name was forgot, though he testifies to the extent of the deserted city, and asserts the height of the ruined walls to be 150 feet. An inconsiderable town seems to have existed on its ruins in the reign of Claudius; and the last notice we have of Nineveh in the classics is in Tacitus.

The fanciful history related by Ctesias is now found to be based on distorted Greco-Persian traditions, and though the writer managed to make the ancient world give credit to him in preference to Herodotus, his work is now proved to be very untrustworthy. According to him, for thirty generations after Ninias, the kings led a life of luxury and indolence in their palace; the last of them, Sardanapalus, made a vigorous defence against Arbaces, the rebel governor of Media, but finding it impossible to defend Nineveh, he set fire to his palace, and burnt himself with all his treasures; this event took place 1306 years after Ninus. Now, the above account represents Nineveh to have perished nearly three centuries before the real date, which was about 606 B.C., and is utterly incompatible with Scripture. Herodotus assigns to the empire a duration of 520 years, and Berosus of 526. In order to reconcile these conflicting accounts, historians have supposed that Nineveh was twice destroyed, but this supposition is now generally rejected. However, that that part of Nineveh was actually destroyed by fire, is proved from the condition of the slabs and statues found in its ruins, which show the action of intense heat.

Assyria became a Median province, 606 B.C., and afterwards, in conjunction with Babylonia, formed one of the satrapies of the Persian empire. In 331 B.C., at Gaugamela, near Arbela, in Assyria, Alexander defeated Darius Codomannus. In 312 B.C. Assyria became part of the kingdom of the Seleucids, whose capital was Seleucia, on the Tigris. It was afterwards subject to the Parthian

kings, whose capital was Ctesiphon, and was more than once temporarily in possession of the Romans. When the Persian monarchy of the Sassanides was destroyed by the successors of Mohammed, Assyria was subject to the califa. Their seat was Bagdad from 762 A.D. till 1258. It has been under the Turks from 1638, at which period it was wrested from the Persians.

Monumental History.—The Babylonian monarchy was already growing old before the Assyrian began. The early rulers of Assur were mere governors appointed by the Babylonian kings. They gradually acquired more power until they managed to set up an independent kingdom at Assur (about 60 miles below the later capital, Nineveh), in the 17th or 16th century B.C. A constant border warfare was long kept up, though alliances were made from time to time, and even cemented by marriages, as when Burna-Buryas of Babylon married Muballitat-Serua, the daughter of Assur-uballit, about 1400 B.C. The first Assyrian king other than a *patesi* or viceroy, was Bel-kap-kapi. His rule extended along both sides of the Tigris, but, under his successors, the boundaries varied with the valour of each king. The kingdom first began to be powerful under Rimmon-nirari I. about 1320. His son Shalmaneser I. founded Calah, and his grandson Tiglath-Adar I. had become so powerful that he invaded Chaldea and captured Babylon in the year 1280. His descendant in the direct line of kings was Tiglath-pileser I., about 1140, the real founder of the first Assyrian empire. The reign of this prince, Tiglath-pileser I., son of Assur-ris-ilim, forms the zenith of the early empire. He spread the dominion of Assyria over all Western Asia, from the frontiers of Elam to the shores of the Mediterranean, and from the slopes of the mountains of Armenia, the land of Uratu, to the shores of the Persian Gulf. He captured Babylon, Sippara, and Upiya (Opis), and reduced Chaldea to the position of a tributary state. On the west he advanced as far as Khilikhi (Cilicia), defeating the Hittites and capturing their stronghold Carchemish, and receiving the homage of the people of Arvad and the cities of Northern Phœnicia. He repaired and enlarged the palace at Calah and the temple of Anu and Rimmon at Assur. The prince Assur-bel-kala, who succeeded his father in 1110, by his weakness as rapidly allowed the empire to fall into decay as his father by his energy had enlarged and consolidated it. For nearly two centuries Assyria sank below the horizon of Western Asiatic history, and became so weakened as to render tribute to the Vannic kings of Armenia. This period of decay is synchronous with the rise and rapid development of the Hebrew kingdom under David and his successors.

In 930 B.C. Assyria once more began to emerge from oblivion, and a new dynasty was founded by Assur-dân II., whose son Rimmon-nirari II. (911-889 B.C.), and great-grandson Assur-natsir-pal (883-858 B.C.), by a long series of cruel wars once more established the power of Assyria. All the old provinces of the former empire were recovered, and extensive annexations made in the regions to the north-east in Armenia and Kurdistan. During the period of the middle empire, the capital was removed from Assur to Calah (*Nimroud*), at the junction of the Tigris and Upper Zab (Lycus), about 20 miles below Nineveh, where elaborate temples and palaces were erected by the kings. Assur-natsir-pal was succeeded in 858 B.C. by his son Shalmaneser II., whose annals are found inscribed on the famous Black Obelisk in the British Museum, and on the bulls and slabs from his palace at Calah. For more than thirty years he carried out year by year a series of campaigns which established the power of Assyria over all Western Asia.

His reign is, however, most important for the fact that during his rule the Assyrian and Hebrew annals are first brought in contact, and a valuable series of synchronisms established, which is maintained until the fall of both kingdoms. In the year 854 B.C. Shalmaneser defeated in the battle of Karkar, fought in the Orontes Valley, a powerful confederation of allied Syrian tribes, of which the chief leaders were Benhadad, king of Damascus, Irkhuleni, king of Hamath, and Ahab, king of Israel, the latter contributing 2000 chariots and 10,000 foot-soldiers. Again, in the eighteenth year of his reign, the Assyrian king invaded Syria, and defeated Hazael of Damascus in a battle fought on the heights of Hermon or Shenir (Deut. iii. 9), and captured 1121 chariots and 470 carriages. He then besieged and captured Damascus, destroying the beautiful garden which then as now fringed the city, and after marching into the Hauran, where he destroyed many cities, he returned and held a tribute 'durbār' at Beyrout, near to which city his statue is carved on the rocks at the mouth of the Nahr-el-Kelb. Here he received tribute from the Tyrians, Sidonians, and *Yahua abil Khūmri*, 'Jehu, the son of Omri.' To the Assyrians Samaria was known as *Bit Khūmri*, 'the house of Omri'; and so Jehu was regarded as one of the line of Omri. The tribute paid on this occasion indicates the wealthy condition of the Israelite capital; 'silver, gold, a bowl of gold, cups of gold, pitchers of gold, and a sceptre for the king's hand.' The reign of Samas-Rimmon II. (823-810 B.C.), the son of Shalmaneser, who succeeded to the throne after a rebellion and civil war lasting two years, added largely to the eastern provinces, and the Assyrians came for the first time in contact with the Aryan invaders who were advancing from the north-east.

In the year 763 B.C. the Assyrian eponym canon records the observation of a solar eclipse in the month Sivan, which is now identified as that of the 15th of June. This eclipse forms the pivot-point on which Assyrian chronology turns. The empire now began to display signs of weakness, and when Assur-nirari ascended the throne in 753 B.C. there were many indications of a spirit of revolt. This is indicated by the statements in the eponym canon. Arpad in Syria revolted, and for four years the army remained at home, owing no doubt to the disturbed state of the country. An attempt was then made to repress the revolts in Nanri or Kurdistan, which apparently failed, for in the year 746 B.C. we have a revolt in Calah, which indicates a rebellion of the army, followed by the usurpation of the throne in 745 by Pulu or Pul, a Babylonian who assumed the Assyrian name of Tiglath-pileser II. Like his early namesake, he proved the saviour of the nation, and at once instituted an entirely new system of government of the provinces of the empire. In former times it was conquest and spoil rather than annexation and annual revenue that formed the policy of the rulers of Assyria. Tiglath-pileser II., however, introduced a new system into the government, that of centralisation. Conquered districts were now annexed and became satrapies ruled by Assyrian officials, and responsible for a fixed yearly revenue to the central government. The leaders of the national party in these regions were removed to Assyria, and their place supplied by bands of colonists from other regions, as in the case of Samaria, Arpad, and Hamath. Another great aim of the new sovereign was the control of the great commercial centres in Western Asia. Thus Carchemish and the cities of Phœnicia were objects of campaigns to secure the trade-route through Syria. In 742 B.C. Arpad revolted and was besieged two years by the Assyrians, and its subsequent fall brought about the conquest of North Syria.

Hamath, then in alliance with Uzziah, king of Judah, and whose king Eniel may have been, as Professor Sayce suggests, a Jewish nominee, was taken by storm, and the kings of Syria hastened then to pay homage to the conqueror. Among the names mentioned in the inscriptions we find Menahem, king of Samaria, Rezin of Syria (Damascus), Hiram of Tyre, Pisiris of Carchemish. This was the campaign referred to in the Scriptures (2 Kings, xv. 19), when Menahem gave a thousand talents of silver to Pul, king of Assyria. The successful war in Syria and Palestine was followed by campaigns in Armenia on the shores of Lake Van. The Assyrians next appear in Syria as the allies of Ahaz, called *Yahua-khazi* or *Jehoahaz* by the Assyrian scribes. The result of this campaign was the siege of Damascus, and the ravaging of the kingdoms east of Jordan. The fall of Damascus made Syria a province of the court of Nineveh, and the tribute-lists discovered by Sir Henry Layard at Nineveh show Carchemish, Damascus, Arpad, Arvad, Hamath, Tyre, Sidon, and Samaria as contributing a regular sum to the national revenue. Having reduced the west to submission, the Assyrian king now attacked Chaldea, and after a severe war, commencing in 731 B.C., he defeated and slew Ukin-ziru, the Kinziros of the Canon of Ptolemy, and was proclaimed king of Sumir and Akkad in 729 B.C.

This important reign ended abruptly in 727 B.C., and a weak prince, Shalmaneser IV., of whom no inscriptions are extant, ascended the throne. He made an ineffectual attempt to capture Tyre, which had revolted, and during the siege either died or was murdered at the instigation of Sargon, 'the Tartan' or commander-in-chief of his army. The usurper continued the war in Syria, and in 720 B.C. captured Samaria and carried away 27,280 of the leading inhabitants, and placed them in the province of Gozan, near the Khabour, and in Media. The latter days of the reign of Tiglath-pileser II. evidently had been marked by a general revolt of the provinces, which Sargon had to reconquer; and in the battle of Raphia on the borders of Egypt, which terminated the war, he checked the advance of the Egyptians under Sabako. In 717 B.C. the Hittite capital, Carchemish, fell, and produced the rich spoil of 'eleven talents, thirty maneh of gold, and two thousand one hundred talents of silver.' All this time the intrigues of Merodach-baladan III. in Chaldea were causing trouble, but the disturbed state of the other provinces still kept Sargon from the object he most desired—the conquest of Babylon. In order to delay the attack, Merodach-baladan sent his embassy to Hezekiah, and raised a revolt in Syria, in which Phœnicia, Moab, Edom, and Philistia, supported by the Egyptians, took part. Sargon besieged Jerusalem and burned Ashdod (Isaiah, xx. 1). Having quelled the revolt, Sargon invaded Babylonia, and after a terrible campaign captured the capital, Merodach-baladan taking refuge in flight, and was proclaimed king 710 B.C. Tablets dated in his reign as king of Babylon are preserved in the British Museum. Sargon built for himself a magnificent palace called *Dur Sargon*, 'Fort Sargon,' marked by the ruins at Khorsabad, about 15 miles from Nineveh. This palace was explored by M. Botta for the French government, and the fine sculptures from this site form one of the treasures of the Louvre. The bas-reliefs, sculptured figures, and architectural decorations of this palace show a new departure in Assyrian art, and indicate foreign influence. Sargon was killed during a revolt of the soldiers in the new palace on the 12th day of the month Ab (July) 705 B.C., when his son Sennacherib succeeded him. The annals of Sennacherib are only known to us for eight years of

his reign. The Babylonian revolt on the death of Sargon led to the return of Merodach-baladan, but nine months later he was defeated by the Assyrians in the battle of Kisu. At the same time a revolt broke out in Philistia, and the people of Ekron having deposed the Assyrian nominee Padi, sent him for security in chains to Hezekiah, king of Jerusalem, who placed him in prison. This brought on the Jewish king the vengeance of Sennacherib. Having conquered Phœnicia, he marched against Ekron, where he punished the chief priests and Philistine lords who had broken their oaths to Assyria, defeating the allies on the plain of Eltekeh, where they were aided by a strong contingent of Egyptian troops. He next

ravaged Judæa, capturing forty-six cities, chiefly in the hill-country, and then advanced to Jerusalem. Here he states he shut Hezekiah up in the capital 'like a bird in a cage.' There is no indication in the inscriptions how long this siege lasted, and the meagre account of this event in the campaign, and the remarkably abrupt termination of the account, seems to indicate that the siege terminated in a disaster to the Assyrian arms. The tribute paid by the king was sent by an envoy to Nineveh, not paid on the surrender of the city; and this, together with the fact that Sennacherib never again entered Palestine, seems to confirm the statements of the Hebrew writers.

The statement as to the murder of Sennacherib

Sennacherib at the head of his Army.
(Height, 38 inches—British Museum.)

by his sons meets with a most accurate confirmation from the inscriptions. In the Babylonian canon we are told that on the 20th of the month Tebet (December) 681 B.C., the king was slain by his two elder sons, who were jealous of the favour shown to their younger brother Esar-haddon, who was at the time serving with the army. Seven weeks later, Esar-haddon overthrew his brothers, together with their ally Erimenas, king of Armenia, at Malatiyeh in Cappadocia, entered Nineveh in triumph, and placed himself upon the throne. Though the most active general of his father, Esar-haddon was far more than a mere warrior. He possessed great political tact, and at once inaugurated a new policy with regard to the troublesome court of Babylon. He divided the court between Babylon and Nineveh, residing at the former place during the winter, the latter in the summer months. It was during one of these periods of the winter court at Babylon that Manasseh was brought prisoner (2 Chron. xxxiii. 11). A son of Merodach-baladan had attempted during the period of anarchy to seize the throne of Babylon, but being defeated, he fled to Elam, where he was put to death by the Elamite king, who wished to preserve the friendship of the king of Assyria. In 675 the Assyrian king commenced one of the most important wars in the whole period of Assyrian history—namely, that which resulted in the subjugation of the powerful kingdom of Egypt to the Assyrians, and left the ancient world under one rule for twenty years, thus first giving to the world the idea of universal empire. After the war had

waged with varied success for more than three years, the Assyrian king made one great effort to terminate it. A very powerful army left Nineveh the first day of the year, and took the road to Egypt. The march occupied three months, and on the Assyrians having reached the Egyptian strongholds, a series of battles was fought, resulting in the retreat of the Egyptians on Memphis, which was captured by the Assyrians on the 22d of Tamuz (June), whereupon King Tirhakah fled up the Nile. Esar-haddon returned by way of the coast of Syria, receiving *en route* the tributes of the Phœnician and Greek kings of Cyprus, and the Philistine, Moabite, and Israelite rulers. In commemoration of this successful campaign, the king had his statue carved on the rocks at Baal-Rasi (Nar-el-Kelb), and an inscription recording the capture of Memphis engraved upon it. Before leaving Egypt the Assyrian king divided the newly conquered land into twenty satrapies, ruled by prefects subject to the court of Nineveh.

The Egyptians did not long remain quiet after the departure of the main body of the Assyrian army; for Tirhakah returned from the Upper Nile, and the Assyrian king had once more to prepare for a campaign in the Nile Valley. During his absence with the main body of the army in Egypt in the previous year, a revolt had been raised in Nineveh; so the king, to guard against the repetition, crowned Assur-bani-pal, the eldest of his four sons, king, and placed him on the throne to rule in Nineveh, 12th Iyyar (April) 669. Two years later, during the campaign, on 12th

Marchesvan (October), the warlike Esar-haddon died with the army. Assur-bani-pal had all the ambition, but he lacked the genius of his father. He was a generous patron of art and letters, and his reign was the culminating point of Assyrian splendour. He continued the Egyptian war, drove Tirhakah from Memphis to Thebes, which city he captured and stripped of its treasures. Phœnicia was next invaded, and Tyre captured, after a siege lasting some months. Campaigns in Elam and in Northern Arabia next occupied the army. The empire was now shaken by one of the most serious revolts raised against the government. Acting, probably, on the advice of his father, Assur-bani-pal had appointed his brother, Samas-sum-yukin (the Saoduchinos of the Canon of Ptolemy), viceroy of Babylon, who, taking advantage of the absence of the Assyrian armies in various lands, rose in revolt, aided by the Elamites, Arabs, and by the Egyptians under Psammethichos. The revolt lasted more than five years, and at last Babylon, Borsippa, Sippara, and Cuthah were besieged and taken, and fire, sword, and pestilence spread through the land. The rebellious prince burned himself in his palace with many of his followers.

This revolt, however, shook the foundations of the empire, and soon the vast fabric began to totter. Egypt declared her independence, Syria was in revolt, Elam and the north-eastern provinces refused tribute, and Kandalanu, the new viceroy of Babylon, proclaimed himself king, while his successor Nabopolassar, father of Nebuchadnezzar, openly threw off all semblance of his allegiance and declared himself king. Assur-etil-il-yukinni succeeded his father about 640. He rebuilt the palace of Calah, and bricks bearing his inscriptions have been found there. The last Assyrian king was Esar-haddon II. (the Sarakos) of Ctesias. There are some tablets relating to this prince which show that during his rule the north-east provinces were invaded by a powerful confederation of Aryan and Turanian tribes, Medes, Gimmerians, and Armenians, under the command of Kartarit (Cyaxares). The meagre character of the inscriptions about this date, and the apparent number of claimants to the throne, indicate that after the death of Assur-bani-pal a period of disruption and anarchy set in, followed about 606 B.C. by the siege and destruction of Nineveh, after which Assyria became a Median province. The Mespila mentioned by Xenophon in the 'retreat of the Ten Thousand' was probably the Musapbi of the inscriptions, 'the lower town,' the acropolis having been destroyed. The remains of Sassanian art found by explorers on the site indicate that the town was occupied then and in Roman times.

Chronology.—The chronology of the Assyrian empire now rests upon a very firm basis, being founded on several carefully prepared chronological inscriptions. The most important of these is the 'Eponym Canon,' a tablet containing a list of the archons, or eponyms of Nineveh or Calah, giving an exact chronology from 913-659 B.C. As each of these officials ruled in office only one year, the year was named after them; and as the date of the official year of Bursagalu is fixed by a solar eclipse, the dates of all the officials can be ascertained. Fragments of seven copies of it were discovered by Sir Henry Rawlinson in 1862. An historical inscription of Rimmon-nirari I., dated on the side by the name of the eponym of the year, enables us to go back as far as 1330 B.C. A recent discovery has brought to light a table of Semitic Babylonian kings, arranged in dynasties, traced back as far as 2330 B.C. The dated contract tablets give us further help for the later dates. The parallel Assyrian inscriptions give much help in settling the chronology of Babylonia.

Government.—The government during the early and middle empires was a pure despotism and rule by force of conquest, held together by the obligations of tribute and homage; but no centralisation existed. In the reign of Tiglath-pileser II., an extensive system of central government with the accompaniment of bureaucracy was introduced. In conquered lands the native rulers were either removed and replaced by nominees from the Assyrian court, or a resident ambassador placed in the court. Tributary cities were ruled by prefects (*pikhats*) and sub-prefects. Revenue was levied by collectors from all towns and districts, and an annual present from the native princes. In home government the Assyrians modelled their system on that of Babylonia. Taxes were levied on all produce from towns and villages, and tithes for the temple revenues. Special taxes were levied for the army, the river-flotilla, and the maintenance of the royal roadways. Justice was administered by appointed judges, the courts being held in the temples or in the city gate, with the right of direct appeal to the king. The king had absolute power over life and death, and offenders were treated with the greatest cruelty; impalement, decapitation, mutilation, and burning by fire, were the punishments inflicted. The king was feudal lord of all land, and could grant or take away any estates except those of the temples. Public works were carried out by *corvée* (forced bands of labourers) and captive-labour, provisions for the workmen being provided by the state.

Religion.—The religion of Assyria, though essentially of Babylonian origin, was much simpler, and though polytheistic in character, was free from the multitudinous pantheon of the more ancient empire. At the head of the pantheon was the god Assur, the national deity, always invoked first in the royal inscriptions, and regarded as the divine founder of the nation. He is called 'the holy one,' 'the glorious chief of the gods.' His name does not appear in the 'Chaldean Creation Tablet.' The Assyrian pantheon consisted of two principal triads, with numerous minor deities: (1) The *Nature triad*, whose birth is described in the Creation Tablet—*Anu*, 'the father of all the gods,' 'the Progenitor, who changes not the decree coming forth his mouth,' 'the lord of heaven,' 'the heaven.' *Bel*, the second member of the triad, is called 'lord of the world,' 'lord who protects the land;' he was the ruler of the earth. *Hea*, the third member, was one of the most important gods in the pantheon. He was 'lord of the sea, of rivers and fountains;' 'lord of wisdom and knowledge. (2) The *Celestial triad*.—This triad consisted of the moon-god, *Sin*, called the 'illuminator of earth,' 'the lord of waxing and waning,' 'the lord of laws.' The sun-god, called *Shamas*, 'the judge of heaven and earth,' 'the lord of light,' 'the driver away of evil.' The sun-god was one of the gods most worshipped in the Assyrian pantheon; and the morning and evening hymns to this deity are among the most beautiful specimens of Assyrian sacred literature. *Istar*, the third member of this triad, was the goddess of the crescent moon, and the 'queen of the stars.' Strictly speaking, the goddess Istar was the only goddess in the Assyrian pantheon, and she assumes many and varied attributes. She was also 'queen of war and battle,' 'the archeress of the gods.' Among the minor divinities, the most important was the god Marduk or Merodach, the son of Hea. This god occupied a most important position; he was 'the mediator between gods and men,' 'the protector of mankind,' the 'god who raises the dead to life.' The goddess Zirat-banit, the Succoth-benoth of the Bible (2 Kings, xvii. 30), appears but little in the Assyrian inscriptions, though most

often invoked in those of Babylonia (q.v.). Next in importance was Nebo, the god of learning, and his consort Tasmituv. The libraries in Nineveh and other cities were all dedicated to this god, and the epithets applied to him indicate that he was the Assyrian Hermes. He is called 'the wise god,' 'the lord of illustrious birth,' 'the enlarger of the mind,' 'the writer of inscriptions.' Nergal (2 Kings, xvii. 30) and Nusku were the gods of war and hunting, and the former also the god of death, with the title of 'the great devourer,' to whom the winged lions at the temple or palace gates were

The god Nergal (British Museum).

dedicated. The two gods of Sepharvaim, Adramelech and Anammelech, are to be identified with Adar-malik, 'the god of the noonday sun,' and Anu-malik—Anu, the father of the gods. Most of the other minor divinities were those worshipped principally in Babylonia. The religious ceremonies of Assyria bore a close resemblance to those of Babylonia, the temples being orientated to the north-east, and the holy place separated from the nave by a veil. The morning and evening sacrifice, the offering of cakes, wine, milk, and honey, are found in the liturgies of the temples. See BABYLONIA.

Ethnology.—The Assyrians, it is now generally acknowledged, were a branch of the Semitic family of nations, and therefore were members of the same grand division of the human race as the Syrians, the Phœnicians with their colonies, the Jews, and the modern Arabians. Long prior to the 21st century B.C., Semitism, as a distinct ethnic element, appears to have first established itself in Chaldea. The races variously called Scythic, Turanian, or Tartar, appear to have once been spread over the whole space from the Caucasus to the Indian Ocean, and from the Mediterranean to the mouths of the Ganges. Their type of language has continued to our time to exist in the greater part of Asia, and in some of the remoter corners of Europe, as among the Finns, Lapps, Turks, and Hungarians. In Chaldea they were the dominant race until about the 21st century, when the pressure of eastern invaders, Elamites, &c. forced the Semites from Chaldea. Then seems to have commenced a series of migrations. Assur went forth probably at this time from Babylon to Assyria, Abraham and his followers to Palestine. From these seats, Semitism was afterwards carried to Cyprus, to the southern seaboard countries of Asia Minor, to Carthage, Sicily, Spain, and Western Africa.

The traditions of Assyria indicate a very early connection between Ethiopia, Arabia, and the cities on the Euphrates. Mesopotamia undoubtedly contained a large proportion of Arabs, and this accounts for the fact that Herodotus styles Sennacherib king of the Arabians and Assyrians.

The Chaldeans, colonies of whom were planted in Armenia by the Assyrian kings, were probably removed from the south. But the Sumirian-Akkadian races (see BABYLONIA) are now shown to have inhabited Babylonia from the remotest times, and by them the earliest civilisation in Mesopotamia was originated (see CUNEIFORM INSCRIPTIONS).

In language, Assyrian is clearly allied to the northern branch of the Semitic family. The vocabulary has a close affinity with Hebrew and Phœnician, while in the full development of the verbal conjugation, the use of numeration, and its richness of synonyms, it approaches nearer to the Arabic. The predominant features of the Assyrian ethnic type are Semitic, but modified by intermixture with Akkadian and other elements.

Literature and Civilisation.—One of the most important results of the explorations has been the discovery, in the palace of Assur-bani-pal at Nineveh, of a large library consisting of many thousand tablets, large numbers of which are now stored in the British Museum. This library, in all probability, owes its origin to the keen political insight of Esar-haddon, but was completed by his son Assur-bani-pal, whose name most of the tablets bear. In the colophon or docket attached to each tablet, the king says: 'The wise things of Nebo, all there was on tablets I wrote, I engraved, I explained, and, for the inspection of my people, in my palace I placed.' A careful study has been made of the tablets in this library, and it is evident it was chiefly composed of tablets copied from more ancient originals in the temple libraries of Chaldea, each being stated to be 'like its old copy,' or 'like the ancient tablets of Sumir and Akkad.' That such was the case is now demonstrated by the discovery of duplicate copies in the libraries of Babylonian cities. The library was evidently founded to prevent the youth of Assyria from going to be taught at Babylon or Borsippa, where they would be subjected to dangerous political influences. Its educational character is shown by the discovery of a number of syllabaries, dictionaries, and text-books for instruction in the ancient Akkadian and Sumirian languages. These tablets, called by the Assyrians 'tablets to be with him' (handbooks), were the class-books of the students in Nineveh, and have been the medium by which the decipherers have learned the older languages of Chaldea (Lenormant, *Études Accadiennes*). In this same section we find works on mathematics, tables of square and cube roots, as well as lists of plants, metals, and precious stones, animals and birds. The geographical works appear to be limited to lists of countries with their products, such as 'Lebanon cedar,' 'Elam horses,' 'Cilicia tin and silver,' and 'Arabia camels.' The section, however, which has been most prolific in discoveries has been that of poetic and mythological literature. In 1872 the late George Smith, of the British Museum, discovered a series of poetic legends relating to the great Chaldean hero Gizdhubar or Izdubar, the eleventh tablet of which contained a legend of the Deluge, very closely resembling the Hebrew account. This series of tablets was found to consist of twelve books of an epic poem, describing the labours of Gizdhubar, the various episodes of whose career are arranged according to the sun's passage through the signs of the zodiac, the Deluge tablet being the eleventh corresponding to the sign Aquarius. From three duplicate copies and numerous fragments, scholars have been able to obtain a nearly complete text of this important tablet, and the resemblances which it presents to the Hebrew narrative are even more striking than was at first recognised. The flood is sent as a punishment for sin; the builder

of the ark is called Samas-napisti, 'the living sun'; he gathers into the vessel all his male and female servants, and young men, and all the beasts of the field. The preparation of the ark occupies seven days, the rain lasts seven days, seven days are occupied in reaching the mount Nizir (safety). Here a sacrifice is offered, and the gods smelling the sweet savour, gather about the altar, and by the intercession of Hea the peace is restored, and a covenant made, and sealed by the appearance of the 'great bow, which Anu had created for his glory.' The resemblances are very striking; but there are also differences, especially local features, which show that the traditions are not copied from one another, but probably have a common origin in an older tradition. The discovery of these legends was followed shortly after by the discovery of an important series of cosmogonic legends. The close resemblance which they present to the Hebrew Genesis story is well illustrated by the first legend, which may be thus translated: 'When as yet the heavens were unnamed and below on earth a name was not recorded. The ocean the glorious was the father of them. The chaotic sea was the mother of them all. Their waters were joined in one. The darkness was not withdrawn (and) no flower had opened. When as yet the gods had not come forth any of them. By name they were not called. Order did not exist,' &c. The resemblance to the first chapter of Genesis is most remarkable, as also in the other fragments. The psalms, hymns, and prayers also are most poetic and beautiful in character.

Antiquities, &c.—The excavations carried out by Botta, Layard, Ménant, Oppert, Rawlinson, George Smith, and Rassam near Mosul, Khorsabad, and Koyunjik, have led to many very interesting discoveries. The palaces and buildings that have been laid open are full of sculptures, all covered with inscriptions, in deciphering which considerable progress has been made, and more may be expected. Among the most remarkable monuments now in the British Museum are two winged human-headed lions, 12 feet high, and as many in length; winged human-headed bulls of the same dimensions as the lions; winged sphinxes; and the famous obelisk of black marble, sculptured on the four sides. On this last are represented a victory, a prisoner prostrate at the feet of the king, and foreign people offering tribute, and leading such animals as the Bactrian camel, elephant, lion, and rhinoceros—animals, with the exception of the lion, found in Asia only far east of the Tigris. The bas-reliefs are very numerous, exhibiting especially war and hunting. The march, the onset, the pursuit, the siege, the passage of rivers, the submission and treatment of captives, secretaries noting the number of heads taken in battle, and the amount of spoil; the chase of the lion, of the antelope, of the wild ass, and other animals—such are the favourite subjects of the Assyrian sculptor. Nor are they treated in the conventional style of Egypt, but in a manner which, for grace, spirit, correctness, and delicacy of execution, excels everything else known in Asiatic art. The artists sometimes follow modes of representation different from ours; for instance, a bull has five legs given him, in order that from all points of view he may be seen with four; a ladder stands edgewise against a side wall, to show it is not a pole. But a truthful impression is always aimed at, and it is this that gives these sculptures their value. The labour bestowed on the careful finish of a priest's dress, and on the tasteful decoration of an article of furniture, proves them to be the work of an ingenious and painstaking people. From the bas-reliefs we learn little about the private life of the Assyrians.

There are a few which represent the foddering of cattle, women riding on mules, &c.

It is natural to expect that Nineveh—a wealthy and luxurious city—imported many of the products of other countries, yet the manufactured goods would mainly be of home production. The jars, bronzes, glass bottles, carved ornaments in ivory and mother-of-pearl, engraved gems, bells, earrings, arms, utensils, are of excellent workmanship. The ornaments especially are in good taste, and evince no inconsiderable skill in the working of metals. Transparent glass was not unknown, nor the use of the lens as a magnifying agent. The Assyrians knew the principle of the arch, the use of the lever and roller, and the construction of aqueducts and drains. In the arts of peace they appear to have been not inferior to any ancient nation; while their conquests, and the long duration of their empire, suffice to prove their capacity for war.

For the archaeology, see the books by Botta, Layard, Oppert, George Smith, and Perrot and Chipiez, *Chaldée et Assyrie* (1884), vol. ii. of their *Histoire de l'Art dans l'Antiquité* (Eng. trans. 1884). For the history, see Rawlinson, *The Five Great Monarchies of the Ancient Eastern World* (4 vols. 1862-67); Oppert, *Histoire des Empires de Chaldée et d'Assyrie d'après les Monuments* (1865); Lenormant, *Manuel d'Histoire ancienne de l'Orient* (3 vols. 1869); Ménant, *Annales des Rois d'Assyrie* (1874); Maspero, *Histoire ancienne des Peuples de l'Orient* (1875, 4th ed. 1883); and Sayce, *Ancient Empires of the East* (1884). For the language, see the grammars of Sayce (1872 and 1875); his *Lectures on the Syllabary and Grammar* (1877); and the dictionaries of E. Norris (1868-72) and Delitzsch (1887). For the religion, see the comparative history by Tiele (2d ed. Amsterdam, 1870; French trans. 1882; English trans., vol. i., 1884); and Sayce's *Hibbert Lectures* (1887). See also the following general books: Sayce's *Assyria: its Princes, Priests, and People* (1885); and *Fresh Light from the Ancient Monuments* (3d ed. 1886).

As'tacus. See CRAYFISH and LOBSTER.

Astar'té, the Greek and Roman form of the name of the supreme female divinity of the Phœnicians. Like that of Baal, the corresponding male divinity, the name frequently occurs in the earlier books of the Old Testament in the plural form *Ashtaroth*, and indeed it is not till the time of Solomon that the singular form *Ashtoreth* occurs. This plural refers rather to different modifications of these deities than to different statues of Baal and Ashtoreth, as Gesenius explained it. The worship of this goddess extended wherever Phœnician colonies were founded, as at Cyprus and Carthage. The general notion symbolised in her attributes was that of productive power, as that of Baal was generative power. Hence, as the sun is the great symbol of the latter, the moon is of the former; and consequently we find the moon identified with Astarte, and the goddess represented horned like the crescent moon. By others she is supposed to be symbolised by the planet Venus, as was also the Greek Aphrodite, who was undoubtedly borrowed from the Phœnician Astarte. Gesenius, Fürst, and most Hebrew scholars, accept the etymology that identifies the name with our word *star* (Sanskrit, *tārā* for *stārā*; Zend, *stāranm*; Pehlevi, *setaran*; Gr. *astēr*; Lat. *stella*). It seems probable that she was at various times symbolised by either. At any rate it is clear that she was an astral deity, like most gods in the Phœnician pantheon, and that the things holy to her on earth were merely symbols, not dwelling-places. Astarte was the object of a sensual nature-worship, attended by many licentious rites and wild orgies. Ashtoreth is no other than the Assyrian Istar with a feminine termination, *th*, in accordance with the Phœnician idiom. The worship of Istar was less practised in Babylonia than in Assyria. Some of the legends of Babylonia make her the daughter of

Sin, the moon-god, the Accadian Agn or Aeu; but others place her among the older gods, making her daughter of Anu, the sky. Considered as the evening star, she was known as Istar of Erech; as the morning star, she was identified with Anunit or Anat, the goddess of Accad. With the Accadians she had a separate and independent existence as a divinity, though she came to be considered by the Semites as but the consort and shadow of the god. She presided over love and war, as well as the chase. She was invoked as 'the queen of heaven,' and 'the queen of all the gods.' Her chief temples were at Erech, Nineveh, and Arbela. Carried through the Semitic world, she was identified with the sun-god Chemosh in Moab, became the Ashtoreth of the Canaanites, and appears in a somewhat different form as the Aphrodite of the Greeks, and the Artemis *polymastos* of Ephesus. One of the most popular of Babylonian myths told how Istar had wedded the young and beautiful sun-god Tammuz, 'the only begotten,' and had descended into Hades in search of him when he had been slain by the boar's tusk of winter. The month of August was called by the Accadians 'the month of the errand of Istar,' while June was 'the month of Tammuz' of the Semites. This 'abomination' could be seen within the very precincts of the temple at Jerusalem (Ezek. viii. 14). She is also identical with the Egyptian *Hathor*, but it is difficult to say which of the two has the greater antiquity. The worship of Hathor, as Tiele points out, may be traced in Egypt long before the time when there was any possibility of Semitic influence, so that we may conclude either that Istar is the Egyptian Hathor in Semitic guise, or that both are forms, modified in accordance with varying national genius, of a goddess originally invoked under a similar name by the common forefathers of the Hamites and the Semites.

Astarte, a genus of Lamellibranch—i.e. bivalve—Molluscs, the type of a family, Astartidæ, very closely allied to the Veneridæ or Venus family. It is interesting chiefly on account of its history; for while only a few species now exist, and these limited to the northern oceans, the fossil species are extremely numerous (commencing with the *Lias* period), and are distributed over the whole world. The Astartidæ were apparently to a large extent replaced by the Veneridæ, which commenced with the oolitic period, and are now among the most abundant bivalve molluscs.

Astatic, 'without polarity' (from the Greek), used most frequently of a magnetic needle so arranged as to be unaffected by the earth's magnetism. This is managed by taking two magnetic needles, as nearly of the same intensity as possible, and placing them parallel to one another, with their poles in opposite directions. They thus neutralise one another, so as to be unaffected by the earth's magnetism, though they remain subject to galvanic action. This compound astatic needle forms the principal part of the astatic galvanometer.

Aster (Gr., 'a star,' from the form of the flowers), a genus of plants of the natural order Compositæ (q.v.) and sub-order Tubulifloræ. The genus contains a great number of species, both herbaceous and shrubby, and chiefly perennial, of which three-fourths are indigenous to North America, the remainder sparingly distributed over Europe and Northern Asia. One species only, *A. tripolium*, the Sea Starwort, is a native of Britain. It is common in salt marshes. A number of perennial species are in cultivation as garden-flowers, of which the New-England Aster (*A. nova anglia*) and the Michaelmas Daisy (*A. tradescanti*), both natives of North America, are perhaps the most

common, and, with some of the other species, are prized as among the comparatively few flowers to be seen at that dull season when autumn is giving place to winter. But the best known and most valued of all the asters is the China Aster—*A. (Callistephus) sinensis*—a summer annual, of which many varieties are in cultivation, and new ones are continually introduced. It was brought from China to France by a missionary in the 18th century, but has since been much improved and varied by culture, and all its florets have been rendered ligulate. The varieties exhibit great diversities of form and colour. The plant delights in a rich free soil. In the northern parts of Britain, the seed is generally sown in April in a hot-bed, or in pots under a frame, and the young asters are planted out in the open air in May. They flower from July to the end of autumn, and contribute much to the liveliness of the flower-garden.

Asterabad. See ASTRABAD.

Asteria, a variety of Sapphire (q.v.).

Asterias and **Asteriada**. See STAR-FISH.

Asterisk (Gr., 'a little star'), a sign or symbol (*) used in writing and printing, as a reference to a note at the bottom or on the margin of the page. The obelisk, or dagger (+), and many other marks, are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, &c. The asterisk often marks the omission of words or sentences, or it distinguishes words as conjectural or obscure, or it may be used merely as a typographical mark for any specified purpose.

Asteroids. See PLANETIODS.

Asterolepis, a name given to what appears to have been the largest fish that lived in old red sandstone times in the European area. Its remains have been met with in Scotland and Russia. It was covered with a strong bony armour, embossed with star-like tubercles—hence the name (Gr. *astēr*, 'a star'; *lepis*, 'a scale'). Its cuirass-like cephalic shield reached a length of 20 and a breadth of 16 inches. *Asterolepis* is supposed to have been from 20 to 30 feet long.

Asterophyllites (Gr., *astēr*, 'a star,' and *phylon*, 'a leaf'), a general name, under which are included some abundant fossil plants of the coal-measures. The forms so designated are the fluted stems of Calamites (q.v.) (*Equisetaceæ*), with slender branches springing from the joints, and bearing whorls of narrow-pointed leaves.

Asthma (Gr.) is a disease characterised by the occurrence of paroxysms, in which the breathing, previously natural, becomes difficult, and is accompanied by wheezing and a distressing sense of tightness in the chest. Asthma frequently appears at first after some inflammatory affection of the respiratory mucous membrane, but often without any such cause. It may begin at any age, but most often before ten. It is often clearly hereditary, affecting several members of the same family; and it may occur in families with a tendency to nervous diseases—e.g. epilepsy. The paroxysms are often preceded by premonitory symptoms—in some by great drowsiness; in others by extreme wakefulness and unusual mental activity and buoyancy of spirits; in at least one case by an attack of ophthalmia. The difficulty of breathing may become permanent in a lesser degree, with severer paroxysms at intervals.

The spasms may occur at any hour, but least often in the forenoon, most commonly between two and four in the morning. The causes inducing an attack vary greatly. In some, asthma only occurs with bronchitis, or with disorder of the stomach; in some it is brought on by particular odours, or

articles of food; in many, locality exerts most influence—e.g. they may suffer little in a smoky town, much in the country; or the reverse.

The asthmatic paroxysm is thus described by Dr Salter, the standard authority on this common but terrible disease: 'The patient goes to bed and sleeps two or three hours, becomes distressed in his breathing, and begins to wheeze, so as to waken those in adjoining rooms. He awakes, changes his position, falls asleep again and again, and the miserable fight between asthma and sleep may go on, till the increased suffering does not allow the patient longer to forget himself for a moment; he becomes wide awake, sits up in bed, throws himself forward, plants his elbows on his knees, and with fixed head and elevated shoulders, labours for breath like a dying man.' If the spasm is protracted, the oxygenation of his blood is imperfectly performed, owing to the scanty supply of air, and his extremities get cold and blue, but at the same time the violent muscular efforts at respiration—in which all the extraordinary muscles of Respiration (q.v.) are called into action—cover him with sweat. The pulse is always small. The chest enlarges during the paroxysm, but in it there is almost perfect stagnation of air. Alarming, however, as the attacks are, even to an onlooker, they are almost never fatal.

The symptoms of asthma are probably produced by spasmodic contraction of the muscular fibres surrounding the smaller bronchial tubes (see RESPIRATION); but they may be caused, at least in some cases, by temporary swelling of the bronchial mucous membrane, analogous to Nettle-rash (q.v.) on the skin.

During the occurrence of a paroxysm, the patient's clothes should be loosened, and he should be placed in such a position as will best assist him in his effort to breathe; to this his own sensations will generally guide him. The number of remedies recommended and sometimes useful during the attack, is itself a testimony to their uncertainty. A few of the most valuable are antimony or ipecacuanha in emetic doses; ether or very strong coffee; nitroglycerine in small doses; chloroform, transient in its effects, and to be used with caution; inhalations of oxygen; tobacco, stramonium, or lobelia smoked in the usual way, with inhalation of the smoke; blotting-paper impregnated with saltpetre and burnt.

A sufferer from asthma must avoid all causes which he finds apt to induce an attack; must attend carefully to his general health, and especially his digestive system; and may obtain much benefit from tonic and anti-spasmodic medicines. The selection of a suitable locality for residence procures for many sufferers relief or immunity. When asthma begins very early in life, it often passes off at or before maturity.

Asti (*Asta Pompeia*), a city of Piedmont, in the government of Alessandria, lies on the left bank of the Tanaro, 35 miles ESE. of Turin by rail. Pop. (1881) 17,340. It is a large town, with walls considerably dilapidated, and the streets generally very narrow and irregular. It has a large Gothic cathedral, which was completed about 1348, and a royal college. There is carried on a considerable trade in silk and woollen fabrics, hats, leather, and agricultural produce. The *vino d'Asti*, a kind of Muscatel (q.v.), is highly esteemed. The town is of high antiquity, having been famous for its pottery before its capture by the Gauls in 400 B.C. On the occasion of its being again taken and destroyed in an irruption of the Gauls, it was rebuilt by Pompey, and received the name of *Asta Pompeia*. In the middle ages, Asti was one of the most powerful republics of Upper Italy. It was captured and burnt by the Emperor

Frederick I. in 1155, and, after a series of vicissitudes, came into the possession of the Visconti of Naples; by them it was ceded to the French, in whose hands it remained till the middle of the 16th century, when the Dukes of Savoy acquired it. Alfieri was born here, 1749.

Astigmatism (from Gr. *a*, 'not'; *stigma*, 'a point'), a defective condition of the eye, in which rays proceeding to the eye from one point are not correctly brought to a focus at *one point*. In *regular astigmatism* (a congenital malformation) the curvature of the cornea is unequal in different meridians, those of greatest and least curvature being at right angles to each other. A spot of light is seen as a small oval, instead of a circle as in a perfect eye; lines in one direction are seen clearly, while lines at right angles to these appear blurred. It can be remedied by the use of suitable glasses, whose surfaces are cylindrical, instead of being spherical like those of ordinary spectacles. *Irregular astigmatism* usually results from old injury or disease of the cornea, and can rarely be improved by glasses. See EYE.

Astley, PHILIP (1742-1814), theatrical manager, equestrian, and the best horse-tamer of his time, was trained as a cabinetmaker, served in General Elliot's regiment of light horse, and in 1770 started an exhibition of horsemanship in an open field at Lambeth. This was enlarged and improved at different periods, being burnt down in 1794 and 1803. In all, he constructed nineteen amphitheatres for equestrian performances, one of which was in Paris.

Astor, JOHN JACOB, millionaire, the founder of the 'American Fur Company,' was born in Germany, near Heidelberg, in 1763. A peasant-son, he helped on his father's farm, until in the 16th year he went to London and worked with his brother, a maker of musical instruments. In 1783 he sailed to America, and by the advice of a dealer in furs whom he met on the voyage, invested his small capital in furs. By economy and industry, he so increased his means that after six years he had acquired a fortune of \$250,000. Although the increasing influence of the English Fur Companies in North America was unfavourable to his plans, he now ventured to fit out two expeditions to the Oregon Territory—one by land, and one by sea—the purpose of which was to open up a regular commercial intercourse with the natives. After many mishaps, his object was achieved in 1811, and the fur-trading station of Astoria (q.v.) was established; but the war of 1812 stopped its prosperity for a time. From this period Astor's commercial connections extended over the entire globe, and his ships were found in every sea. On his death at New York, 29th March 1848, he left property estimated at \$20,000,000, and a legacy of \$350,000 for the establishment of a public library in New York.—His wealth was mainly inherited by his son, WILLIAM (1792-1875), who continued to augment it till his death, when he is said to have left \$50,000,000. He added \$200,000 to his father's bequest for a public library. He was known as the 'landlord of New York,' from the extent of his property in that city.

Astorga, EMANUELE D', composer, born at Palermo in 1681, was the son of a baron of Sicily, who, for opposing the annexation of the island to Spain, was executed (1701) in the presence of his wife and son. Emanuele studied music in a Spanish monastery at Astorga in Leon, from which he derived his name, and whence in 1704 he was invited to the court of the Duke of Parma. His patron, erroneously suspecting that his daughter was receiving his addresses, sent him away to the court of the Emperor Leopold. Astorga died in a

monastery at Prague, 1736. His master-work is a *Stabat Mater* (ed. by R. Franz, Halle, 1864).

Astoria, originally a fur-trading station in Oregon, United States, on the left bank of the Columbia, founded by the Pacific Fur Company in 1811, and named from its chief proprietor, John Jacob Astor. It was a main point in the American claim to the territory of Oregon (q.v.). There are upwards of 50 large salmon-tinning establishments in the neighbourhood, in which thousands of men are employed during the fishing and packing season. The lumbering industry is also important. Pop. (1881) 2803. See Washington Irving's *Astoria* (1836).

Astrabad', a town in the north of Persia, at the foot of the Elburz Mountains, 30 miles SE. of the Caspian. It was long the residence of the Shah's ancestors, the Kajar princes, but owing to its remoteness the court was removed to Teheran; and since then its importance has declined, whilst the population is said to have dwindled from 75,000 in 1808 to 10,000 or even 5000.

Astræa, daughter of Zeus and Themis, or of Astræus and Eos (Aurora), was the last of all the goddesses to leave the earth when the golden age had passed away. She took her place in heaven as the constellation Virgo in the zodiac.—*Astræa* is also the name of one of the Planetoids (q.v.).

Astræa. See CORAL, and MADREPORE.

Astragalus, a bone of the foot, which, by a convex upper surface and smooth sides, forms, with the leg-bones, the hinge of the ankle-joint. Its lower surface is concave, and rests on the *os calcis*, or heel-bone. See FOOT.

Astragalus. See TRAGACANTH.

Astrakhan, a government in the SE. of European Russia, watered by the Volga, and washed on the SE. by the Caspian Sea. Area, 91,327 sq. m.; pop. (1881) 708,911. It is almost entirely a barren waste, the only fertile portions being along the Volga. Salt is procured from the marshes of the steppes, considerable numbers of cattle are reared, and fish are taken in the Volga, and sent to Nijni Novgorod. The climate is marked by its extremes, and the population by the variety of its nationalities.

ASTRAKHAN, its capital, and one of the chief towns of Russia, is situated on a high island in the Volga, 41 miles from its mouth in the Caspian Sea. It is surrounded by fruit-trees and vineyards, and consists of the fortress (Kreml), the White Town (Beloigorod), and 16 suburbs (Sloboden). The Kreml and the White Town alone have houses of stone; the suburbs contain wooden buildings only, and irregular, dirty, and unpaved streets. Lengthwise through the middle of the city runs a canal which connects the Kutum arm of the Volga with the main stream. Of nearly 40 Greek churches, the finest is the cathedral (1696), on the highest point in the Kreml. Pop. (1890) 57,700, consisting of Russians, Armenians, Tartars, and Persians. Almost the entire commerce with Persia and Transcaucasia passes through the city. Its great markets attract every year many thousands of merchants, and its three bazaars are among the busiest marts in Europe or Asia. The city is connected by steamers with all parts of the Caspian, and is the principal harbour of that sea, although it is only when south winds raise the water that it can accommodate the largest vessels. The principal articles imported are wheat, barley, woollen stuffs, spirits, iron, tin, drugs, fruit, gold manufactures, raw silk, cotton, cotton yarn, and cotton fabrics. The industries are shipbuilding, dyeing, silk manufacture, shagreen-working, tallow-melting, seal-oil boiling, and

soap-making. The fisheries are of high importance, and rank amongst the greatest in the world. Enormous numbers of sturgeon are taken.—*Astrakhan* is the name of a fine description of fur, the produce of a variety of sheep found in Bokhara, Persia, and Syria.

Astral Spirits. The star (Gr. *astron*) and fire worship of the eastern religions rested on the doctrine that every heavenly body is animated by a pervading spirit, forming, as it were, its soul; and this doctrine passed into the religio-physical theories of the Greeks and Jews, and even into the Christian world. In the demonology or spirit-systems of Christendom in the middle ages, astral spirits are conceived of sometimes as fallen angels, sometimes as souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Their intercourse with men and their influence were variously represented, according to the notion formed of their nature. As the belief in spirits and witchcraft reached its height in the 15th century, the demonologists, or special students of this subject, systematised the strange fancies of that wild period; and astral spirits were made to occupy the first rank among evil or demoniacal spirits. Paracelsus, however, and others attributed to every human being an astral spirit, or sidereal element, in which the human soul, or spirit proper, is thought to inhere, and which lives for a time after the person dies. Moreover, Paracelsus recognised astral or sidereal elements in matter. Astral salt was the basis of the solidity and incombustible parts of bodies; astral sulphur was the source of combustion and vegetation; astral mercury, of volatility and fluidity. These three elements were analogous to the three elements of man—body, soul, and spirit.

Astringents (Lat. *ad*, 'to,' and *stringo*, 'I bind'), medicines employed for the purpose of contracting the animal fibres and canals, so as to check fluxes, hemorrhage, and diarrhoea. The drugs most commonly used as astringents are alum, catechu, oakgalls, rhatany-root, &c. Many of the vegetable astringents owe that property, in whole or in great part, to tannin. A severe degree of cold is a powerful astringent.

Astroca'ryum, a genus of American palma. See PALM.

Astrolabe (from two Greek words signifying 'to take the stars'), the name given by the Greeks to any circular instrument for observing the stars. Circular rings, arranged as in the Armillary Sphere (q.v.), were used for this purpose. A projection of the sphere upon a plane, with a graduated rim and sights for taking altitudes, was known as an astrolabe in the palmy days of astrology. It has been superseded by the more perfect instruments of modern astronomy. Chaucer published a learned *Treatise on the Astrolabe* in 1391, edited by Professor Skeat in 1872 for the 'Early English Text Society.'

Astrolabe Bay, a large inlet of the sea on the northern coast of the eastern portion of New Guinea, opposite the end of New Britain. The vegetation of the shores is luxuriant; a range of mountains, 14,000 feet high, bounds the view some 15 miles inland; the anchorage is exposed and insecure, and there are no practicable harbours.

Astrology (Gr., 'science of the stars') in early times was a comprehensive term for the study, both of the motions of the heavenly bodies, and of their supposed influence on human and terrestrial affairs. Now it has only the latter meaning, the term Astronomy having usurped the former. Astrology is one of the oldest superstitions, prevailing in very early times among the Egyptians,

Hindus, Chinese, Etruscans, and above all, the Chaldeans. Its rise may be regarded as produced by the impatient curiosity, and desire for harmony, of our race. Long ere any regularly operating laws were discerned in national or individual history, they could be seen in the more marked changes of material nature, among which the motions and influences of the heavenly bodies most conspicuously ranked. In the case of the sun, these ruled and vivified the earth. It was natural, then, to suppose that the overruling power which ordered the apparent chances of human life resided in the heavens, and that its decrees might be read there, the motions of the heavenly bodies proving, on trial, to be predictable. The astrology of the Egyptians was founded on solar theories. They connected each point of the sun's course with a stage of human existence. To them its rising, culmination, and gradual descent figured the progress of man's life in youth, maturity, and age. The Chaldeans, or Chaldaic-Babylonians, included in their system the other planets also. It was chiefly to their labours and fancies that the ancient world owed its astrology. Their name even became a synonym for astrologers, and continued long to be so, and on their system medieval astrology was principally founded. But their astrology was more noble in its conceptions than the degraded medieval and modern forms of the science. They considered the stars and planets not as the mechanical powers ruling men's destinies, but as a revelation of the Supreme Being. They held them as incarnations or emanations—sentient beings—proceeding from the absolute Being. Each planet was thus a visible deity. With this mythology, however, was gradually conjoined accurate observation of the motion of the heavenly bodies (see ASTRONOMY), producing a strange mixture of science and fantastic imagery. In Rome astrology found many adherents, though the educated were generally hostile; Cicero, the elder Pliny, and Tacitus declared against it. Seneca, however, believed in the influence of the stars on men; and astrology profoundly influenced the Alexandrian mystics and the Neoplatonists.

The spread of Christianity in the West, and later of Mohammedanism in the East, entirely altered the character of astrology. By both it was robbed of its polytheistic element. But the Arabs, as fatalists, found its tenets more congenial. Under the Califs Al Mansur and Albumazar it was diligently cultivated, and is still accepted by the Arabs everywhere. How inwrought in Mohammedan society it became may be seen by any student of the *Arabian Nights*. To Christianity it was less akin; though its influence appears in the beautiful story of the wise men of the East journeying to our Saviour's cradle. These were most probably Chaldean magi and astrologers. Some of the early fathers, however, accepted or modified the doctrine of astrology. Clemens Alexandrinus, Origen, and Augustine, all protest against it. By later church authority it was regarded as obnoxious, and several times publicly condemned. But by many zealous Catholics, and even churchmen, it was cultivated. Cardinal D'Ailly, in the 15th century, is said to have calculated the horoscope of Jesus Christ, and maintained the astrological predictability of the deluge. Louis XI. of France, among his many superstitions, numbered also this, and maintained for long the astrologer Galeotti. Nostradamus (q.v.) was the great astrologer of the 16th century; during which, though the most learned and powerful minds continued to cultivate the science, it gradually declined from its former position of credit and power. It could not endure the double assault of the Reformation and its accompanying

spirit of true scientific inquiry. Tycho Brahé, Kepler, and Gassendi represent well this stage in its history. Their own discoveries, with those of Copernicus and Galileo, sapped its foundations, though they could not shake off its influence on themselves. Protestant theologians like Melancthon cultivated the science. Paracelsus and Cardan combined astrology with alchemy and medicine. Burton, of the *Anatomy*, died about the date he had himself forecast. Robert Fludd and William Lilly in England represent the latest period of the public power of astrology. The latter especially is well known by his almanac, his prophecy of the great plague and fire of London, and his claim to foresee the fate of Charles I. He was even for a time pensioned by parliament for giving information. Dryden had his children's nativity reckoned. With Newton, astronomy emerged from mystery. His conceptions extended the terrestrial laws of the planets. The sun and stars—in his words, 'but great earths vehemently hot'—could no longer be viewed as rulers of destiny, and astrology thenceforth passed into the hands of quacks and pseudo-scientists, only an isolated effort being made here and there to rehabilitate it.

For great solitary minds, astrology has ever had an attraction. Wallenstein was a complete believer in it, and Napoleon I. often spoke of his star and his destiny, and through them was accessible to flattery. A modern astrologer declares that Napoleon and Wellington were born, the one under Saturn, the other under Jupiter, in the house of dignities. Hence Napoleon's dignities were misfortune to himself and others, Wellington's were beneficent, and finally superior. This astrologer was not a Frenchman. One of the last professed astrological authors of standing was Pfaff in Germany, who published his *Astrologie* in 1816. Amongst Parsees the wedding-day is fixed by an astrologer.

Natural astrology, the science by which the motions of the heavenly bodies were predicted so far as the knowledge of the time might allow, contained much of scientific value, and is now absorbed in Astronomy (q.v.).

The science of *judicial* astrology, which studies to predict terrestrial occurrences by means of the heavenly bodies, is simple. For its purposes the celestial sphere was divided into twelve sectors called 'houses of heaven.' The surface of a peeled orange appears divided in a manner which fairly represents these. Place the axis of the fruit horizontally in a north and south line, then the divisions of its surface will represent their position on the most common system. If its axis be inclined so as to point either to the pole of the equator or ecliptic, it will show the houses on other less common plans. These houses are supposed fixed, and the planets in their diurnal and orbital movements thus pass from one to another, traversing them all in a day. We shall use only the common system in explaining. On this, as the astrologer stood looking southward, he would have six houses dividing the visible heavens, in order from left to right, the horizon dividing these from the six below him. In three ways these houses differed. Their power depended on their *position*, the one containing the stars about to rise being most powerful. It was called the 'ascendant' (hence our expressions 'ascendency' and 'his star is in the ascendant'). Secondly, the houses differed in their subject matter, thus: (1) Life, (2) riches, (3) brethren, (4) parents, (5) children, (6) health, (7) marriage, (8) death, (9) religion, (10) dignities, (11) friends, (12) enemies. Thirdly, certain houses belonged to certain planets, which, when in them, had peculiar power. How the characteristics of a

house were summed up may be seen from the following description, taken, however, from a work founded on the *eclectic* scheme. 'Cancer (in this scheme the fourth house) is the sign of the tropic, particularly fruitful, but cold, watery, nocturnal, northerly, movable, weak, and mute. It is the house of the moon, and exaltation of Jupiter. It produces fair and pale complexions, round features, gray or mild blue eyes, weak voice, the superior portions of the body large, slender arms, and an effeminate constitution.' Three houses were assigned by the observer to each of the four ages of the person whose horoscope was drawn, and we can easily see how, having fixed the planetary configurations, he had the means of a pseudo-scientific prophecy at his disposal.

Usual Method, in drawing a Horoscope, of representing the Twelve Houses of Heaven.

From the above description it can also be seen how closely astrology was connected with physiognomy and observation of bodily appearance. Each planet—in some schemes each house—ruled certain parts of the world and of the human body, being thus productive or avertive of certain diseases, and specially ruling certain states. Mars was lord of iron and the blood. Aries ruled Great Britain, France, and Germany. A conjunction of Mars and Saturn (malignant in his influence) in Aries might then threaten war and pestilence to a great part of Europe. Gemini ruled the arms and shoulders. But different authorities, in a matter so much of fancy, differed much in assigning those properties, and fierce controversies have raged between them, now happily forgotten. Still, however, many accept this strange, but not unnatural, superstition. The astronomer royal is often annoyed by letters requesting him to draw the horoscope of children, or to help by the stars in finding lost property. Hence astrology is now a means of extracting money from the simple. The 'astrology man,' or sometimes 'woman,' still has a delineation of the zodiac in his darkened room, and conjures with it to the loss of curious servant girls and apprentices. *Zadkiel's Almanac* and the magazine *Urania*, by their existence show, too, that such credulity is not confined to the illiterate. But the chief interest of astrology to the educated is as an almost forgotten, but remarkable, development of the mind of man. Our everyday language, however, still testifies to the once widespread belief in astrology. We still speak of men as 'jovial,' or 'saturnine,' or 'mercurial' in temperament—an unconscious survival of a time when the planet under which a man was born per-

manently influenced his life. Jupiter or Jove was the joyfulest star, hence those born when he was in the ascendant were jovial and joyous; while those born under Saturn were saturnine, grave, and gloomy; and those under Mercury as mercurial and light-hearted as himself. The words 'disastrous,' 'ill-starred,' 'ascendency,' and 'influence,' as well as such phrases as 'born under a lucky star,' point in the same direction. Long after astrology ceased to be a belief, it retained its power over the imagination. Thus allusions to it are frequent in Milton, Ben Jonson, and their contemporaries, though its claim to being a real science was by that time generally discredited. It is interesting to see that even Chaucer in his later tales had come to think it a delusion, though in earlier years he must have been a devoted student of it, as is testified by his learned discussion of the subject in his *Treatise on the Astrolabe*, written for his son and published in 1391.

Readers will find further information in Christmas's *Cradle of the Twin-Giants—Science and History*; Robuck's *Astrology and Magic*; Zadkiel's *Handbook to Astrology*; Raphael's *Guide to Astrology*, and in the valuable work of M. Lenormant.

Astronomy (Gr. *astron*, 'a heavenly body'; *nomos*, 'a law') teaches whatever is known of the heavenly bodies.

The history of astronomy dates from a very early period. It is the most ancient of all the sciences. The Chinese, Hindus, Chaldeans, Egyptians, and even the Greeks, are known to have investigated the heavens very long before the Christian era. In China, astronomy was intimately associated with state politics; the Indians, Chaldeans, and Egyptians made it a matter of religion; and each of these nations applied it to astrological purposes.

The Chinese, Chaldeans, Hindus, and Egyptians each claim the honour of having been the first students of astronomy, and each have had advocates to support their claim. The Tirvalore tables (said by the Hindus to belong to an epoch 3102 years B.C.) are, so far as their date is concerned, altogether unreliable. A conjunction of the sun, moon, and planets, adduced to fix it, could not possibly have taken place at the time specified. Indeed, many contend that these tables are founded on science communicated to the people of India either by the Greeks or Arabians in much later times. Others maintain that they are original Hindu productions. The matter remains still somewhat uncertain.

The Chinese have astronomical annals claiming to go back 2857 years B.C. In these there is little record of anything but of the appearance of comets and solar eclipses; and regarding the latter phenomena, they tell nothing, save the fact and date of their occurrence. Professional astronomers were compelled to predict every eclipse under pain of death. The popular idea was, that an eclipse was a monster having evil designs on the sun, and it was customary to make a great noise, by shouting, beating of gongs, &c. in order to frighten it away from its solar prey. The many eclipses which the Chinese report have been recalculated, but not more than one anterior to the time of Ptolemy could be verified. At an early period, however, the Chinese appear to have been acquainted with the luni-solar cycle of nineteen years (introduced into Greece by Meton, and since known as the Metonic Cycle), and they had also divided the year into 365½ days. Solstitial observances are said to have been made by a gnomon in the 11th century B.C. To the burning of all scientific books by one of their princes (Tsin-Chi-Hong-Ti), 221 B.C., the Chinese attribute the loss of many theories, or methods previously in use. The precession of the equinoxes was not known to the Chinese until

400 A.D., but long prior to that they were familiar with the motion of the planets. They even record an observation of a conjunction of five planets, made between 2514 and 2436 B.C.

The mass of evidence seems in favour of the plains of Chaldea being the primal seat of observational astronomy. The risings and settings of the heavenly bodies and eclipses were subjects of observation and notation by their priests at a very remote period. Simplicius and Porphyry mention that Callisthenes, who had accompanied Alexander the Great to Babylon, on its conquest by that monarch, discovered there a catalogue of eclipses, recorded on tablets of baked clay, the earliest dating from 2234 B.C. These, by Alexander's orders, were sent to Aristotle. They are nearly all now lost, six only being preserved by Ptolemy, the earliest dated 720 B.C., and forming the first reliable observation we possess. The Chaldeans were genuine astronomers. They used different kinds of dials, invented the zodiac, gnomon, and clepsydra, divided the day into the hours we now use, and discovered the *Saros*, or cycle of about 18 years and 10 days, during which the moon makes 223 synodical revolutions, and eclipses recur in the same order for several cycles. They also were so exact in the orientation of their chief buildings, as to show no mean accuracy of observation. Their proficiency in arithmetic was probably due to their astronomical work.

The Egyptians, it is supposed, were the first instructors of the Greeks in astronomy. They do not, however, appear to have observed much for themselves. The meaning of what data they have left behind them can be guessed at only in a few instances. No mention is made by Ptolemy of the idea ascribed to them, that the planets Mercury and Venus moved round the sun; the probability therefore is, Ptolemy not being likely to overlook such a novel theory, that they entertained no such notion at the time of his visit, but that it is an after-thought of more recent ages. From the accuracy with which the great pyramid faces the cardinal points, it was probably used for astronomical purposes. It is designed on principles requiring much astronomical knowledge. But other pyramids do not show the same correctness of plan; and it is probable that the priests of Herodotus's time had lost the knowledge of their remote ancestors, for the information he received from them about the sun having risen thrice in the west, would seem to show the inaccuracy of their observation and weakness of their theorising power.

Up to this time, astronomy is little else than tradition. The Greeks have the honour of elevating it into a reliable history, and to the dignity of a science. Thales (640 B.C.), the founder of the Ionic school, laid the foundation of Greek astronomy. He it was who first propagated the theory of the earth's sphericity. The sphere is divided into five zones. He predicted the year of a great solar eclipse, but this it is now supposed he must have casually succeeded in doing—the Greeks at this time having no observations of their own to guide them—by means of the Chaldean *Saros* (above mentioned), which gives a regular recurrence of eclipses. He made the Greeks, who, prior to his time, were content to navigate their vessels by the Great Bear—a rough approximation to the north—acquainted with the Lesser Bear, a much better guide for the mariner. Among other things, he held that the stars were composed of fire, and that the earth was the centre of the universe. The successors of Thales held opinions which in many respects are wonderfully in accordance with modern ideas. Anaximander, it is said, held that the earth moved about its own axis, and that the moon's light was reflected from the sun. To him

is also attributed, on somewhat slender authority, the belief in the idea of the plurality of worlds. Anaxagoras, who transferred the Ionic school from Miletus to Athens, is said to have offered a conjecture that, like the earth, the moon had habitations, hills, and valleys.

Pythagoras (500 B.C.), who was the next astronomer of eminence, was very far in advance of his predecessors. He promulgated, on grounds fanciful enough, the theory—the truth of which, however, has been since established—that the sun is the centre of the planetary world, and that the earth circulates round it. Pythagoras also first taught that the morning and evening star were in reality one and the same planet. But his views met with little or no support from his successors until the time of Copernicus. Between Pythagoras and the advent of the Alexandrian school, nearly a couple of centuries later, the most prominent names in astronomical annals are those of Meton (432 B.C.), who introduced the luni-solar cycle, as already intimated, erected the first sun-dial at Athens, and in conjunction with Euctemon, observed a solstice there in the year 424 B.C.; Callippus (330 B.C.), who improved the Metonic cycle; Eudoxus of Cnidus (370 B.C.), who brought into Greece the year of 365½ days, and wrote some works on astronomy; and Nicetas of Syracuse, who is reported to have taught the diurnal motion of the earth on its axis.

The Alexandrian school, fostered by the Ptolemies, originated a connected series of observations relative to the constitution of the universe. The positions of the fixed stars were determined, the paths of the planets carefully traced, and the solar and lunar inequalities more accurately ascertained. Angular distances were measured with instruments suitable to the purpose, and calculated by trigonometrical methods, and ultimately the school of Alexandria presented to the world the first system of theoretical astronomy that had ever comprehended an entire plan of the celestial motions. The system we know to be false, and inferior to the Pythagorean notions; but it had the merit of being founded upon a long and patient observation of phenomena.

The most interesting circumstances connected with the early history of the Alexandrian school are the attempts made to determine the distance of the earth from the sun, and the magnitude of the terrestrial globe. Aristarchus of Samos—the pioneer of the Copernican system, as Humboldt calls him—was the author of an ingenious plan to ascertain the proportion of the moon's distance to that of the sun.

Among other eminent members of this school were Timocharis and Aristyllus, who made the observations which, together with observations of his own, enabled Hipparchus (q.v.) to discover the precession of the equinoxes; and Eratosthenes (q.v.), who determined pretty accurately the obliquity of the ecliptic and the latitude of Alexandria (he also measured an arc of the meridian between Syene and Alexandria, thus determining roughly the size of the earth); and Autolycus, whose books on astronomy are the earliest extant in the Greek language.

We now reach the greatest name in ancient astronomical science—that of Hipparchus of Bithynia (190–120 B.C.), and here may be said to begin the real written history of scientific astronomy; for not until his era were there facts correct enough and sufficient in number upon which to build a system. Hipparchus was at once a theorist, a mathematician, and an observer. He catalogued no less than 1081 stars. This is the first reliable catalogue we have. He discovered, as we have already mentioned, the precession of the

equinoxes; he determined with greater exactitude than his predecessors had done, the mean motion, as well as the inequality of the motion of the sun; and also the length of the year. He also determined the mean motion of the moon, her eccentricity, the equation of her centre, and the inclination of her orbit; and he suspected the inequality afterwards discovered by Ptolemy (the evection). He invented processes analogous to plane and spherical trigonometry, and was the first to use right ascensions and declinations, which he afterwards abandoned in favour of latitudes and longitudes.

For more than two centuries and a half after the demise of this indefatigable astronomer, we meet with no name of note. Ptolemy (130-150 A.D.) is the next who rises above the mass of mediocrities. Besides being a practical astronomer, he was accomplished as a musician, a geographer, and mathematician. His most important discovery in astronomy was the evection of the moon. He also was the first to point out atmospheric refraction. He extended and improved many of the theories of Hipparchus, and was the founder of the system known by his name, which was universally accepted as the true theory of the universe, until the researches of Copernicus exploded it. The Ptolemaic system, expounded in the *Great Collection*, or, as it was called by the Arabs, the *Almagest*—from which source most of our knowledge of Greek astronomy is derived—placed the earth immovable in the centre of the universe, making the entire heavens revolve round it in the course of twenty-four hours. See **PTOLEMAIC SYSTEM**.

With Ptolemy closes the originality of the Greek school. His successors were men of no mark, confining themselves for the most part to astrology, or to comments on earlier writers. It is to the Arabs that we owe the next advances in astronomy. They commenced making observations 762 A.D., in the reign of the Calif Almansor, who gave great encouragement to science, as did also his successors, the 'good Haroun Al-Raschid' and Al-Mamun, both of whom were themselves diligent students of astronomy. Under the latter a small arc of the meridian was measured in Mesopotamia. For four centuries the Arabs prosecuted the study of the science with assiduity, but they are chiefly meritorious as observers. They had little capacity for speculation, and throughout held the Greek theories in superstitious reverence. They, however, determined with much more accuracy than the Greeks had done the precession of the equinoxes, the obliquity of the ecliptic, and the solar eccentricity; and the length of the tropical year was ascertained within a few seconds of the truth. The most illustrious of the Arabian school were Albategnius or Al Batani (880 A.D.), who discovered the motion of the solar apogee (see **ANOMALISTIC YEAR**), and who was also the first to make use of sines and versed sines instead of chords; he corrected the Greek observations, and was altogether the most distinguished observer between Hipparchus and the Copernican era; Ibn-Yunis (1000 A.D.), an excellent mathematician, who made observations of great importance in determining the disturbances and eccentricities of Jupiter and Saturn; and Abul Wefu, who first employed tangents, cotangents, and secants, and possibly discovered the lunar variation.

In the northern part of Persia, an observatory was erected by a descendant of the renowned warrior Genghis Khan, where some tables were constructed by Nasir-Eddin. Omar, a Persian astronomer, proposed a reformation of the calendar, which, if adopted, would have been more accurate than the Gregorian reform. And at Samarcand,

Ulugh Beg, a grandson of Timur, made in 1433 A.D. many observations, and the most correct catalogue of stars which, up to his time, had been published.

In the 13th century, astronomy was again introduced into Western Europe, the first translation from the *Almagest* being made under the Emperor Frederick II. of Germany, about 1230; and in 1252 an impulse was given to the science by the formation of astronomical tables under the auspices of Alfonso X. of Castile. An Englishman, named Holywood (Sacrobosco), in 1220 wrote a book of great repute in its day on the spheres, chiefly abridged from Ptolemy; and among others who did much to promote a taste for astronomy were Purbach (1460), Regiomontanus (John Muller), who died in 1476, and Waltherus, a pupil of the latter, who made numerous observations of merit.

We now come to the illustrious name of Copernicus (1473-1543), to whom was reserved the honour and the danger of exploding the Ptolemaic idea, and of promulgating a correct though imperfect theory of the universe. His system is in some part a revival and systematic application of the opinions said to have been held by Pythagoras. It makes the sun the immovable centre of the universe, around which all the planets revolve in concentric orbits, Mercury and Venus within the earth's orbit, and all the other planets without it. In the Copernican theory there were many of the old notions which have since been exploded. See **COPERNICUS, COPERNICAN SYSTEM**.

Among the contemporaries of Copernicus were Reinhold, who constructed the Prutenic tables; Recorde, who was the first to write on astronomy in English; and Nonius, a Portuguese, who invented a method for dividing the circle. The study of astronomy was also much aided about this time by the liberality of the Landgrave of Hesse-Cassel, William IV.

Decidedly the most industrious observer and eminent practical astronomer from the time of the Arabs to the latter half of the 16th century was Tycho Brahe (1546-1601). Some discredit attaches to him on account of his repudiation of the Copernican system, but it should not be forgotten that in the time of Tycho that system was not supported by the conclusive evidence we now possess. Tycho's system, which made the sun move round the earth, and all the other planets round the sun, they moving with it round the earth, explained all natural phenomena then observed equally well, while it must have appeared more probable than the crude and, at that era, undemonstrable theories of Copernicus. Tycho Brahe compiled a catalogue of 777 fixed stars, more perfect than any that had previously appeared. He made the first table of refractions, and discovered the variation and annual equation of the moon, the inequalities of the motion of the nodes, and the inclination of the lunar orbit, and rejected the trepidation of the precession, which had hitherto injuriously affected all tables. He also made some interesting cometary investigations.

To his researches are mainly due the discovery by Kepler (1571-1630) of those famous laws which have rendered his name immortal (see **KEPLER**). To Kepler is due the credit of divesting the Copernican system of its absurdities. He is also said to have had some notion of the law of gravitation.

Galileo Galilei (1564-1642) first applied the telescope (which he made from a general description of the instrument of Hans Lipperhey of Holland, who was the first inventor of the telescope) to the investigation of the heavens. He was rewarded by the discovery of the inequalities on the moon's surface. The important discoveries of the four satellites of Jupiter, the ring of Saturn—not

then distinctly recognised as a circle—the spots on the sun, and the crescent form of Venus, followed in quick succession. For propagating the Copernican doctrine of the world, Galileo incurred the displeasure of the priests, and was compelled by the Inquisition to retract his opinions. See GALILEO.

The next great epoch in the history of astronomy brings us to England and Newton (1642–1727). In the interval, practical astronomy had profited largely by the logarithms of Napier; the mathematical researches of Descartes; the work of Horrox, who ascribed the motion of the lunar apses to the disturbing influence of the sun, so far forestalling Newton, and observed the first recorded transit of Venus; the application of the telescope to the quadrant by Gascoigne, an Englishman, and afterwards by Azout and Picard; by Römer's discovery of the progressive motion, and measurement of the velocity, of light; by the invention of Vernier; and the application of the pendulum to clocks by Huygens, who also brought into use the spiral spring, and made some valuable observations on the ring and satellites of Saturn; as well as by the investigations of Norwood, Hooke, Hevelius, Gilbert, Leibnitz, and Dominicus Cassini, to the last of whom especially the scientific world owes much. Among a variety of other valuable observations and discoveries may be mentioned his thorough investigation of the zodiacal light, his determination of the rotations of Jupiter and Mars, and of the motions of Jupiter's satellites from their eclipses, his discovery of the dual character of Saturn's ring, and also of four of his satellites. Newton's fame rests upon his discovery of the law of gravitation, upon which the common belief he was led to speculate by the fall of an apple. Newton announced his discovery in the *Principia* in 1687, which was briefly that every particle of matter is attracted by, or gravitates to, every other particle of matter, with a force inversely proportional to the squares of their distances. The first gleam of this grand conclusion is said to have so overpowered Newton that he had to suspend his calculations, and call in a friend to finish the few arithmetical computations that were incomplete. This discovery is perhaps the grandest effort of human genius of which we have any record. Newton also made the important discovery of the revolution of comets round the sun in conic sections, proved the earth's form to be an oblate spheroid, gave a theory of the moon and tides, invented fluxions, and wrote upon Optics.

While the foundations of physical astronomy were thus broadly laid by Newton, Flamsteed—the first astronomer royal at Greenwich, to whom, until recently, scant justice has been done—and Halley were greatly improving and extending the practical department of the science. To the former we are indebted for numerous observations on the fixed stars, on planets, satellites, and comets, and for a catalogue of 2884 stars. His *Historia Cœlestis*, published in 1725, formed a new era in sidereal astronomy. Dr Halley, who succeeded Flamsteed as astronomer royal, discovered the accelerated mean motion of the moon, and certain inequalities of Jupiter and Saturn, but he is most famed for his successful investigations into the motions and nature of comets. His successor was Dr Bradley, who, in the year of Newton's death, made the important discovery of the aberration of light, which furnishes the only direct and conclusive proof we have of the earth's annual motion. To him also we are indebted for our knowledge of the nutation of the earth's axis. He was, besides, an unwearied observer, and left behind him at his death upwards of 60,000 observations. Altogether, Bradley's is deservedly one of the most honoured names in modern astronomy. Dr Maskelyne, who

was appointed to the observatory after Bradley, originated the *Nautical Almanac*.

These three Greenwich observers (Flamsteed, Bradley, and Maskelyne) span with their labour (from 1676 to 1811) a period during which both practical and theoretical astronomy were greatly developed. The discovery of gravitation gave men power to reduce the wanderings of the moon and planets to order, while the accuracy of calculation demanded more correct observation and better instruments. Dollond, Bird, Harrison, and Graham, famous instrument-makers, provided the last, while the three above mentioned, together with Römer, Bianchini, Lacaille, Cassini, and others, made observations far more correct than any before. On these observations much was founded of important theory, and new problems in celestial mechanics were thus presented. In solving these, Euler, who generally investigated the planetary motions in his *Theoria Motuum*, and published solar and lunar tables; Clairaut, who improved the theory of the earth's figure, and investigated the motion of the lunar apogee; D'Alembert, who assisted in investigating the planetary theory, precession, nutation, and the earth's figure; Lalande, who treated the orbit of Halley's comet, and published his planetary tables; Lagrange, who discussed the lunar libration (applying first the principle of *virtual velocities*), the theory of Jupiter's satellites, and the attraction of spheroids, were all eminent workers. Greatest in this field, however, was the Marquis de Laplace. With his investigations on the solar system, Jupiter's satellites, Saturn's ring, the theory of tides, and above all his great work, the *Mécanique Céleste*, he brings us into the 19th century, and to something like the full development of theoretical astronomy.

How complete this had now become will be seen by the manner of discovery of the planet Neptune. The motions of Uranus, the outermost then-known planet, had been carefully watched since its discovery by Sir W. Herschel, and an orbit was speedily assigned it. For about fourteen years the planet kept to this path, and then began to *gain* on its predicted place, continuing to do so for about twenty-seven years, when it ceased to advance and soon began to fall behind, continuing steadily to do so. It was seen by Leverrier, a young French astronomer, and Adams, then a student at Cambridge, that these movements could be explained by the action of a planet exterior to Uranus, and they both independently tried to solve the problem thus presented, and indicate the disturbing planet's place. This problem could be solved so as to indicate any one of an infinite number of planets, each of which would produce the observed disturbance of Uranus. It was treated differently by the two investigators. Both assigned certain probable values to the distance and period time of the unknown body, which made their work possible. Each wrought out his solution, and found the elements of the unknown body's orbit. Adams sent word to Professor Challis of Cambridge, and Leverrier later advised Dr Galle of Berlin where to look for it. Dr Galle first saw it on September 23, 1846, within a degree of Leverrier's calculated place, and three degrees of Adams's. It is true the planet was found to have a different orbit from that assigned by the calculators. Their planets were in fact not identical, nor were they the planet Neptune. But they must ever have credit for the sagacity and ability with which, aiming at so indefinite a target, they so nearly struck the centre.

But partly parallel to this advance of theoretical astronomy there had been an enormous development of physical astronomy, so that it practically became a new science. Sir W. Herschel discovered

double binary stars (see STARS), catalogued vast numbers of Nebulæ (q.v.), and by new methods framed daring theories of the constitution of the universe and the stars. Earlier than Laplace he thought of the nebular hypothesis, since confirmed in many ways, and by his discoveries gave an impulse to the new work of determining the physical state of the heavenly bodies. His son, Sir John Herschel, did for the southern heavens what his father had for the north. Their giant reflecting telescopes, with the refractors of Fraunhofer, Merz, and Mahler of Munich, and the larger ones since constructed by Cooke, Grubb, Alvan Clark, and continental makers, enabled this work to go on. W. and O. Struve at Dorpat and Pulkowa, with a host of other observers, largely amateurs, carried on the observation of double stars. Beer and Mädler, with Schmidt of Athens, mapped with great accuracy the surface of the moon. And the surface of the planets has been scrutinised, with some results in the case of Mars and Jupiter, by a multitude of telescopes, which have been so cheapened and improved as to have attracted to their use, especially in America, numbers of amateur workers. By the invention of the Spectroscope (q.v.), the investigation of the chemical constitution and physical state of the sun, stars, and nebulae, was rendered possible. Fraunhofer, Balfour Stewart, and Kirchhoff, all deserve mention in connection with this great discovery. By it the heavenly bodies have been shown to consist of similar matter to the earth; the constitution of many stars, their physical state and temperature, the causes of the variability of some, and the fresh outbursts of others, with their motions in the line of sight, have all been investigated with success. The sun, however, has been the chief field of triumph for spectroscopic astronomy. Its physical constitution, vast atmosphere, and enormous gaseous eruptions, have been observed, and the problems they raise so far solved. Young and Langley in America, Janssen in France, Secchi in Italy, Zöllner in Germany, and Huggins and Lockyer in England, are leading names in solar research. It is in this field of physics that astonishing advances are now made even daily. Through it astronomy has largely absorbed into itself all the other sciences, and become so extensive that its history must henceforth be theirs. It has in turn assisted them all. Through the physical changes of the sun and planets, light has been thrown on the meteorology of the earth, on geology and chemistry, on electrical and magnetic science.

Photography has also played a prominent part in astronomy. Daily photographs of the sun's surface are now made in more than one observatory. The form and number of the spots on his surface (discovered to have a periodical increase and diminution in about eleven years, by Schwabe of Dessau) are thus continually recorded. The planets, stars, and even nebulae, have also been pictured by the camera, and vast fields opened for the future extension of the science. Dr Draper of New York, the brothers Henry of Paris, Captain Abney and Mr Common in England, have done good service in this field.

Since the beginning of the 19th century, there have been added to our solar system upwards of 300 Planetoids (q.v.) or asteroids. Ceres, the first seen of these, was discovered by Piazzi at Palermo on January 1, 1801. Their number has been increased almost monthly by the work of observers such as Peters (of Clinton, New York) and Palisa. On the nights of August 11 and 17, 1877, Professor Asaph Hall, using the great refractor of the United States Naval Observatory, Washington, discovered two satellites of the planet Mars, most minute and interesting bodies. Astro-

nomers now, too, look with interest for the results of the work of those lately charged with the use of the gigantic and perfect instruments of the Lick Observatory, California, which in effective power seem likely to surpass all their predecessors.

Branches of Astronomy.—Astronomy has three main divisions: practical astronomy, which deals with the observation of phenomena; theoretical astronomy, which treats of the real motions of the heavenly bodies; and physical astronomy, which regards their physical state, chemical constitution, and the configuration of their surface.

In practical astronomy, the errors of instruments and observations, the construction of observatories, and the division of the celestial sphere by the circles and points to which the positions of the stars are referred, have all to be considered.

Theoretical astronomy is the application to the explanation of the discoveries of practical astronomy of the law of gravitation.

Physical astronomy applies the sciences of terrestrial nature, by proper instruments, to the heavenly bodies, and has come to be really the great welding science of the universe.

The science is also otherwise divided into sidereal astronomy, treating of the stars and nebulae; solar physics, the study of the sun's physical state; selenography, the mapping of the moon; planetary astronomy, regarding the planets; meteoric astronomy, and other divisions, taking their name from the instruments used, or the subject investigated. Some of these have their practical, theoretical, and physical sides, as will be evident from their titles; but as yet they are scarcely all agreed on as separate departments.

According to the plan of this work, the detailed treatment of the extensive subject of astronomy falls to be given in the separate articles on the most important departments of investigation and instruments. The principal articles will be found under the following heads:

Aberration of Light.	Kepler's Laws.	Photography,
Acceleration.	Lat. and Long.	Celestial.
Almacantar.	Libration.	Planetoids.
Altazimuth.	Lunar Theory.	Planets.
Aphelion.	Meridian.	Precession.
Apsides.	Meteors.	Ptolemaic System.
Ascension, Right.	Moon.	Quadrant.
Comet.	Mural Circle.	Satellites.
Constellation.	Nebulae.	Scintillation.
Copernican System.	Nodes.	Seasons.
Cycle.	Nutation.	Sextant.
Day.	Observatory.	Sidereal Clock.
Earth.	Occultation.	Solar System.
Eclipses.	Orbit.	Solstice.
Ecliptic.	Orrery.	Stars.
Elements.	Parallax.	Sun.
Equatorial Inst.	Penumbra.	Tides.
Equinoxes.	Perigee.	Transit Instrument.
Galaxy.	Perihelion.	Twilight.
Gravitation.	Period.	Year.
Harvest Moon.	Perturbation.	Zodiac.
Horizon.	Phases.	Zodiacal Light.

Herschel's *Outlines of Astronomy*; Lardner and Dunkin's *Handbook of Astronomy*; Newcomb's *Popular Astronomy*; Grant's *History of Physical Astronomy*; A. M. Clerke's *History of Astronomy during the 19th Century* (ed. 1887); Ball's *Story of the Heavens*; and Whewell's *History of the Inductive Sciences*.

ASTRUC, JEAN, a celebrated physician, born at Sauves, in Languedoc, March 19, 1684, died May 5, 1766. He studied medicine at Montpellier, where he afterwards succeeded Chirac as professor (1717). In 1731 he was appointed regius professor of Medicine at Paris, whither his lectures attracted students even from foreign countries. As a physician, his treatises on midwifery and kindred subjects were highly valued; but probably his most famous work was published at Brussels (1753) under the title of *Conjectures sur les Mémoires originaux, dont il paroît que Moïse s'est*

servi pour composer le Livre de la Genèse. By his distinction between the Elohist and Jehovistic sources of the account, he practically founded the school of modern criticism of the Pentateuch.

As'tur. See FALCONIDE and GOSHAWK.

Asturias, or OVIEDO, a northern province of Spain, washed on the north by the Bay of Biscay. Area, 4091 sq. m.; pop. (1884) 579,794. The low hills of Leon and Old Castile rise gradually to the mountain-chain which forms the south boundary, and which is but a prolongation of the Pyrenean system. The northern slopes are broken by steep and dark valleys or chasms, which are among the wildest and most picturesque in Spain. The chief rivers are the Nalon, Navia, and Sella. Agriculture is the chief industry. The coasts have good fisheries, but poor harbours. Asturias abounds in rich mines, which as yet are indifferently wrought. The chief minerals of the province are copper, iron, lead, cobalt, arsenic, antimony, and coal of excellent quality. A railway from Gijon connects Asturias with Leon and the Spanish railway system. The chief towns are Gijon, Aviles, Llanes, and Lueca. Oviedo (q.v.), the capital, has since 1833 given its name to the whole province. The eldest son of the Spanish king has the title of Prince of Asturias, professedly an imitation of the English Prince of Wales, having been taken at the solicitation of the Duke of Lancaster in 1388, when his daughter married the eldest son of Juan I.

The Romans had great difficulty in subduing Asturias, about 22 B.C. Later it offered an asylum to the Goths, whose prince, Pelayo, bravely withstood the Arabs (718 B.C.); his successors carried on the contest successfully, and became kings of Leon in the 10th century.

Asty'ages, son of Cyaxares, the last king of Media, reigned 594-559 B.C. In the latter year he was dethroned by Cyrus, who, according to Herodotus, was his grandson. An old tradition has it that Astyages, having no male heir, married his daughter, Mandane, to Spitames, a Median, whom he declared his successor, and so aroused the jealousy of the other great nobles; that the Persian Cyrus revolted in 559, and defeated Astyages, whom he took prisoner, but afterwards appointed governor of Hyrcania; and that Spitames was slain, and Mandane then became the wife of Cyrus. For Herodotus' account, which is probably nearer the truth, see CYRUS.

Asuncion, or ASSUMPTION, the capital of the South American republic of Paraguay, stands on a terrace skirting the left bank of the Paraguay River, and has connection by steamers with Buenos Ayres, and by a railway of 45 miles with Paraguari. It has a cathedral (1845) and a college. Its trade has recovered from the depressing effects of the war with Brazil in 1865-70; the principal articles of commerce being leather, tobacco, sugar, manioc, and maté or Paraguay tea. It was founded in 1537, on 15th August, the feast of the Assumption. Pop. (1857) 40,000; (1886) 22,000.

Asylum (Lat., from Gr. *asylon*, 'inviolable'), a sanctuary or place of refuge, such as a temple or church or their precincts, from which criminals, debtors, or persecuted persons could not be removed without sacrilege. See SANCTUARY, INSANITY.

Asymptote (Gr., 'not coinciding'), a line that continually approaches nearer and nearer to some curve, but only meets it at an infinite distance. An example of an asymptote will be seen under HYPERBOLA. As another illustration, let AB be a straight line which can be produced to any length towards B. Take any point, C, without the line,

and draw a perpendicular reaching to any distance, D, beyond the line; set off any equal distances, E-1, 1-2, 2-3, &c., along AB; and draw C1d, C2d', C3d'', &c., making 1d, 2d', 3d'', &c., equal to ED. Now it is evident that each of the points d, d', &c., is nearer to the line AB than the one to the

left of it; if, therefore, a curve is traced through these points (the curve is called the *conchoid*), it must continually approach the line AB. On the other hand, it is evident that the curve can never meet AB at any finite distance; for a line drawn from C to any point in AB, however distant that point, must, when produced, cross AB. AB is thus an asymptote to the curve. To the senses, indeed, the curve and line soon become one, because all physical or sensible lines have breadth. It is only with regard to *mathematical* lines that the proposition is true; and the truth of it has to be conceived by an effort of pure reason, for it cannot be represented. An asymptote may also be curvilinear. For example, certain spirals have a circle as their asymptote. The spiral continually approaches the circle, but never meets it.

Atacama, the name, formerly, of two provinces, (1) Chilian and (2) Bolivian; most of the latter has, since the late war, been transferred to Chili. —(1) A northern province of Chili, with an area of 39,400 sq. m., and a pop. (1885) of 76,566. About 1000 silver and 250 copper mines are worked, and gold is also found in considerable quantities. Salt deposits cover sometimes 50 sq. m. Copper, to the value of over £1,500,000 annually, is the chief export to England. Capital, Copiapo; pop. (1884) 10,374. —(2) The Bolivian department extended as far north as Peru, and east to Argentine Republic and the department of Potosi. In 1861 its area was put down as 70,181 sq. m., and its pop. as 5273. No trustworthy figures are published regarding the small portion, no longer a province, still retained by Bolivia; all that part of the district west of the Andes was ceded in 1884 to the Chilians, and formed into the department of Antofagasta, with an area of 60,770 sq. m., and a population stated (1885) at 21,213. The recently discovered mines of Caracoles are said to be the most productive silver-mines in the world. The former capital, Cobija (pop. 2380), was long the only port in the district; but the rival port of Antofagasta, founded in 1870, had by 1884 attained a population of 7946. —The *Desert of Atacama* extends through both provinces, but, since the war of 1879, has belonged entirely to Chili. From the steep, almost inaccessible coast, the land rises in rocky plateaus, broken at intervals by precipitous mountain-chains. Generally speaking, the soil is not at all sandy, but rocky; and the scanty rainfall of the district affords an additional reason for the growth of only the hardiest of desert plants, and for the frequency and extent of its dry salt-marshes. In the war it was treated as important, owing to its silver and salt-petre works, which have to some extent peopled its once desert solitudes.

Ata'camite, an ore of copper, found in the iron-mines of Schwartzenberg in Saxony, and also

as a crust on the lavas of Vesuvius and Etna, especially on those of Vesuvius erupted in the years 97, 1804, 1820, and 1822. It occurs abundantly in some parts of South America, as in Atacama, from which it derives its name, and other districts in Chili; and at Tarapaca (now also Chilian) it is associated in veins with ores of silver. The natural varieties of atacamite are crystallised, massive, and pulverulent or granular. The massive or compact variety is usually reniform, with a fibrous structure. The crystals are short and needle-shaped; the primary form is a rhombic prism or rectangular octahedron. It has been sometimes described as a chloride of copper, but incorrectly; and sometimes as a hydrochlorate (muriate) of copper: it is rather to be regarded as a combination of protoxide of copper with chloride of copper. It is a rich and productive ore, containing about 55 to 60 per cent. of copper. Atacamite often forms on the surface of copper exposed to the air or sea-water; and the greenish incrustation observed on antique bronze utensils, weapons, and other articles, and commonly known as the *argento nobilis*, is composed of this salt. On some antique bronzes from Egypt the atacamite is crystalline. Atacamite is worked in South America as an ore of copper; and considerable quantities are sent to England to have the metal extracted therefrom. See COPPER.

Atahualpa, last of the Incas, was the favourite son of Huayna Capac, who died in 1525. The mother of Atahualpa not being of the pure Inca blood, her son was formally excluded from inheriting the throne; but on his death-bed the father assigned to Atahualpa the kingdom of Quito (recently conquered), while Huascar, his eldest son, obtained Peru. After some years, Huascar demanded homage for the kingdom of Quito, and war was declared between the brothers. In 1532 Huascar was completely defeated near Cuzco and taken prisoner. In the meantime, the Spaniards had disembarked; and after a perilous march through the unknown country, Pizarro, at the head of his two hundred cavaliers, approached the victorious camp of Atahualpa. By a daring but diabolical stratagem, Pizarro obtained possession of the person of the king, who had come by invitation to visit him in a friendly spirit. While a priest was explaining the Christian religion, at a sudden signal, the mysterious firearms poured death into the terrified masses of Peruvians, and the Spanish cavalry rode them down with merciless fury. Atahualpa, made a captive, agreed to pay an enormous ransom; but was accused of plotting against Pizarro, tried, and condemned to be burnt. On his agreeing to be 'baptised,' his sentence was commuted to death by strangulation (1533).

Atalan'ta, the name of two heroines in Greek mythology, often confounded with each other. (1) The Arcadian Atalanta, daughter of Iasus and Clymene. At her birth she was exposed by her father, who had wished for a son, but she was suckled by a she-bear, and grew up to be a maiden-huntress of marvellous courage and skill. She slew the centaurs who pursued her, afterwards sailed with the Argonauts to Colchis, and took a prominent part in the chase of the Calydonian boar. She had many suitors, but was merciless in the conditions which she imposed on them. Being the swiftest of mortals, she offered to become the wife of him that should outstrip her—the penalty of defeat being death. At length she was conquered through stratagem by Milanion. He obtained from Venus a gift of three golden apples, which he dropped one after another during the race; and Atalanta was so charmed by their beauty, that she could not refrain from stooping to gather them,

and so lost the race. They were both metamorphosed into lions for having profaned the sacred grove of Zeus. Her story has been put into poetic form by Swinburne in his *Atalanta in Calydon*; and the race is the theme of a picture by Poynter. The same story is told of (2) the Boeotian Atalanta, daughter of Schoenus, but her husband was Hippomenes.

Ataman. See HETMAN.

Atavism (Lat. *atavus*, 'ancestor'), or REVERSION, is a term applied to the frequent appearance of ancestral, but not parental characteristics in an animal or plant. It is a commonplace that a boy 'takes after his grandfather,' and all organisms exhibit the same tendency to reproduce often remote ancestral characters. An occasional horse exhibits the long-lost stripes of the wild form; a blue pigeon, like the primitive *Columba livia*, sometimes turns up unexpectedly in a pure breed; or a cultivated flower reverts to the simpler and more normal type of the original wild plant. Even in detailed anatomical structure, a comparatively trivial character lost for many generations may suddenly reappear. Darwin has shown that reversion is greatly favoured by the disturbance to the organisation which results from crossing, while in other cases a return to more natural or primitive conditions of life brings about the ancestral variation. The possibilities of the variation are at once insured and limited by the summing up of the past history in the constitution of the germ, but the direct conditions which determine the particular modification are in many cases very obscure. See DARWINISM, HEREDITY, INSANITY, VARIATION, &c., and Darwin's *Animals and Plants under Domestication*.

Ataxy, LOCOMOTOR. See LOCOMOTOR ATAXY.

Atbara, a tributary of the Nile, rises in Abyssinia near Lake Tzana, flows mainly north-west, and after receiving the larger Takazze, joins the Nile below Berber—being the only tributary of the Nile below the junction of the White with the Blue Nile. For some months in the year its course is almost dry; but after the rainy season it is an important stream.

Atchafalaya, an outlet of the Red River or of the Mississippi, but receiving very little of the waters of the latter except in time of flood. It runs nearly southward to Chetimaches Lake, and after passing through it, reaches the Gulf of Mexico by Atchafalaya Bay after a course of about 220 miles. Its name means 'lost river,' and it is supposed to have been once the bed of the Red River.

Atcheen (also *Acheen* or *Atchin*; called by the Dutch *Atjeh*), until 1873 an independent state in the north-west part of Sumatra, now a province of the Dutch Indies, with an area of 6370 sq. m., and a pop. (1884) of 579,753. The surface is divided into an eastern and a western half by the mountain-chain which traverses the whole island, and which rises in Abong-Abong to 11,000 feet. On both sides are numerous stretches of level or undulating soil, watered by small but deep streams, and admirably adapted for arboriculture, gardening, and the cultivation of rice. The flora and fauna agree with those of Sumatra: pepper and areca-nuts are peculiar to Atcheen. The natives employ themselves in agriculture, cattle-rearing, trade, fisheries, weaving cloth, and working in gold, silver, and iron. In appearance, dress, character, and manners, they are distinct from the rest of the inhabitants of Sumatra. Of darker colour and lower stature than the latter, they are also more active and industrious, good seamen and soldiers; but they are treacherous, revengeful, bloodthirsty, immoral, and inordinately addicted

to opium. Their ethnological place is not yet settled; their speech, according to Van der Berg, belongs to the Polynesian family.

The capital of the government is Kota Radja or Atcheen, in the north-western extremity, situated on a stream navigable by boats, about 4½ miles from its port Oleh-leh, with which, since 1876, it has been connected by a railway. Formerly a large and flourishing city, it was almost entirely destroyed during the war, but is now beginning to revive. It contains a Dutch garrison of 2000 men.

During the earlier half of the 17th century Atcheen was a powerful sultanate, with supremacy over several islands and a part of the Malay Peninsula. Its power gradually declined; but an attempt was made by the treaty between the English and the Dutch in 1824 to reserve its independence. The inevitable war, however, broke out in 1873, and ended as inevitably, though not without a desperate resistance, in the conquest and annexation of the sultanate. The capital was carried by storm in 1874, and the final subjection of the whole country was carried out by General van der Heyden in 1879.

Atchison, a city of Kansas, U.S., on the left bank of the Missouri, 333 miles above St Louis. It is an important railway centre, nine distinct lines converging here. The city has flour-mills, an iron-foundry, machine-shops, manufactures of furniture, carriages, and wagons, and an extensive general trade. It has grown rapidly. Pop. (1870) 7054; (1890) 15,106; (1890) fallen to 13,963.

Ate, according to Homer, the daughter of Zeus—of Eris, as Hesiod says—was a vengeful goddess, ever attending *dysnomia*, or transgression of law, though she herself prompted men to such. She was banished from Olympus by Zeus, whom she had incited to take an oath of which he subsequently repented. She then travelled to and fro over the earth with great rapidity, always intent on exercising a pernicious influence upon mankind. But her steps were followed by the goddesses *Litai* ('prayers'), benevolent daughters of Zeus, who healed those who had been afflicted by Ate. The tragic writers describe Ate as the goddess of retribution. Their representations almost identify her with Nemesis and Erinnyes. Of the greater tragedians she is most prominent in Æschylus, and least in Euripides, in whom the idea of *Dikē* ('justice') is more fully developed.

Ateles. See SPIDER-MONKEY.

Ateliers Nationaux, or NATIONAL WORKSHOPS, was the name given to the works which were organised by the Provisional Government at Paris in the spring of 1848, after the downfall of Louis-Philippe, and which were intended to give occupation to the unemployed at that time of disturbance. A permanent department was established, called *The Committee of the Government for the Workmen*. This establishment acted on the doctrine that the workmen were entitled to have a living provided for them on a certain uniform scale, which was fixed at two francs per day. It should be said, however, that the works were mostly unproductive, and therefore a mere burden on the national revenue. Of the crowds which flocked for employment, both from Paris and the provinces, many could not be provided with work of any kind, and had a dole of one franc a day given them. By the time a regular government had been established at the beginning of May (1848), the numbers thus engaged had increased to 130,000. As it had become a serious tax on the revenue, the government proceeded to break up the *workshops*, a measure which kindled into flame the discontent fermenting in the capital. The armed insurrection of the lower

classes of Paris which ensued, was put down by the national forces under Cavaignac only after the terrible fighting of the *Days of June*. The *ateliers nationaux* are generally, but quite inaccurately, confounded with the *ateliers sociaux* of Louis Blanc (q.v.).

Atellanae, *Fabulae Atellanæ* (also styled *Ludi Osci*), a kind of popular drama in Rome, first introduced from Atella, a town in Campania, between Capua and Naples. After the Greek drama had been brought to Rome by Livius Andronicus, the old *Fabulae Atellanæ* were still retained as interludes and after-pieces. They are not to be confounded with the Greek satiric drama, although the character of both was to some extent the same. In the latter, satyrs figured; while the former personated real Oscan characters. The *Maccus* and *Bucco* of the *Fabulae Atellanæ* may be considered the origin of the modern Italian *arlecchino* (harlequin), and other characters of the same stamp. They were the favourite characters; spoke the Oscan dialect, and excited laughter by its quaint old-fashioned words and phrases. The *Atellanae* were neither so dignified as the *comœdia prœtextata*, nor so low as the *comœdia tabernaria*, but were characterised by a genial and decent drollery. The caricature was at first always pleasant, and though quizzical, it did not lapse into obscenity, like the *mimi*. Respectable Roman youths, who could not appear as actors in the regular Greek drama without losing caste, were allowed to take parts in the *Atellanae*. They were commonly divided into five acts, between which were frequently inserted the *exodia*, old-fashioned and laughable interludes in verses. The latter also were played by young and well-born Romans. See the fragments collected after Bothe and Munk by Ribbeck in *Scenica Romanorum Poesis fragmenta* (2d ed. 2 vols. Leip. 1871-73). See also Munk, *De Fabulis Atellanis* (Leip. 1840).

Ateshga ('place of fire'), a spot about a mile in diameter, on the peninsula of Apsheron, on the west coast of the Caspian Sea. It is considered sacred by the Guebres, or Persian Fire-worshippers, who still visit it in large numbers, and bow before the holy flames which issue from the bituminous soil. The site of a former temple of this sect is now occupied by large petroleum works, where the natural gas is utilised for fuel for the vast retorts.

Ates'sa, a town of South Italy, 23 miles SSE. of Chieti. It has a beautiful collegiate church. Pop. (1881) 5086.

Ateuchus. See SCARABÆUS.

Ath, or AATH, a fortified town in the province of Hainault, Belgium, on the navigable Dender, 32 miles SW. of Brussels. It has a lofty tower dating from 1150, an arsenal, hospital, and college, important manufactures of linen, calicoes, lace, &c., and a brisk trade. Pop. (1883) 9394.

Athabasca (locally *La Biche*, 'red-deer or elk river'), a river and lake in the North-west Territory of the Canadian Dominion, forming part of the great basin of the Mackenzie. The river rises in the Rocky Mountains, in a little lake at the foot of Mount Brown, one of the highest points in the range. Its general course is NE., till, after crossing the west end of Lake Athabasca, it turns towards the NW., and unites with the Peace River, from beyond the Rocky Mountains, to form the Slave River, which, again, after passing through Great Slave Lake, takes the name of the Mackenzie. Length of the Athabasca, over 600 miles; or about 2000 miles for the entire river system. The Athabasca-Mackenzie affords magnificent facilities for navigation; and between it and

the Winnipeg system there is but one portage of 50 miles. *Lake Athabasca* receives nearly all its waters from the *Athabasca River*; and its principal feeder traverses not its length but its breadth, and that not in its middle, but at its extremity. The lake's sole outlet is the river *Athabasca*. It is about 230 miles long, and from 14 to 30 broad. It was discovered in 1771 by Samuel Hearne, and named by him *Lake of the Hills*. Trading stations were soon afterwards established on its shores. A silting-up process has been going on, from its numerous water-courses.—*ATHABASCA* is the name of one of the four divisions of the Canadian North-west, defined in 1882, between British Columbia and a line to the east of the *Athabasca River*, and between the parallels 55° and 60° N. lat. It contains the fertile *Peace River* districts, and has an area of 122,000 sq. m. Estimated population, 10,000.

Athaliah, the daughter of Ahab, king of Israel, married Jehoram, king of Judah, and introduced into the southern kingdom the worship of Baal. After the death of her son Ahaziah, who succeeded him, but reigned for only one year, she sought to pave her own way to the throne by putting to death all the seed-royal. Ahaziah's son Joash was, however, hidden by his aunt, and after Athaliah had reigned six years, the high-priest Jehoiada placed Joash on the throne (878 B.C.), and caused her to be put to death. This narrative (2 Kings, xi.; 2 Chronicles, xxii. xxiii.) is the subject of an oratorio by Handel, and of Racine's drama, *Athalie*, for which Mendelssohn composed the music.

Athanaric, a prince of the Western Goths, whose settlements lay on the north bank of the Lower Danube, in the 4th century. He fought three successive campaigns with the Emperor Valens, but was finally defeated in 369. When the Huns advanced towards Europe, Athanaric attempted to secure the eastern borders of his kingdom; but the Huns defeated the Goths, and advanced in great force into the plains of Dacia. When, in 376, the Western Goths had settlements granted them by the Romans on the south of the Danube, Athanaric, with a part of his people, refused to accompany them, and removed to the west. In 380, however, he was obliged to retire, when he accepted the hospitality of the empire at the hands of Theodosius. At this time died Frigiter, king of the Goths, who had settled on the south of the Danube; and Athanaric, being made king of the whole Western Gothic nation, concluded a treaty incorporating that people with the other subjects of the empire. He died at Constantinople in 381.

Athanasian Creed, the third of the three œcumenical symbols, derived its name from its composition being attributed to Athanasius; it is also known, from its initial words in Latin, as the creed or psalm *Quicumque Vult*. The first part of this creed contains a detailed exposition of the Trinity; the second, the doctrine of the incarnation. Modern criticism has called in question the title of Athanasius to be considered the author of this creed. It was known as early as the beginning of the 6th century, but not under its present name. It is spoken of as 'Athanasius's Tract on the Trinity,' in some Articles of the middle of the 8th century, and is supposed to be alluded to, 'as the Faith of the holy prelate Athanasius,' in the Council of Autun, about 870. Athanasius himself makes no mention of this creed, although its doctrines are essentially his; nor do any of the church fathers. Other two circumstances speak against its ascription to Athanasius: the best text is in Latin, and he wrote in Greek; the expressions, again, are

different from those used by Athanasius in speaking of the same things. By Protestants, therefore, and even by most Catholics, its Athanasian origin has been given up, and its production has been assigned with most probability to the 5th century and to Gaul. The title of Athanasian probably became attached to it during the Arian controversy in Gaul, as being an exposition of the system of doctrine which was opposed to the Arian system, and which would naturally be called Athanasian from its chief propounder. It was received into the public offices of the Gallic Church in the 7th century, and by the middle of the 10th century it was adopted at Rome and all over the West. In Britain, it was probably in use as early as 800. The Greek Church was late in receiving it, and even then not without modifying the article concerning the 'Procession of the Holy Ghost.' The Reformers adhered to the Athanasian Creed, and Luther called it 'a bulwark of the Apostles' Creed,' and doubted whether, 'since the time of the Apostles, any more important and more glorious composition had been written.' Even those churches that do not in any way acknowledge it as a symbol (as the Presbyterian Churches of Britain and America, as well as the Independents) generally accept its doctrines.

The Athanasian Creed is the most rigid of the three Catholic symbols, and has given rise to much controversy; and though still generally received by Protestants as well as Catholics, attacks upon it have, of late years, perhaps been more frequent. It has no place in the Prayer-book of the Protestant Episcopal Church of America; and the Protestant Church of Ireland, though retaining it in the Prayer-book, has ceased to recite it. Nevertheless, these attacks have called forth energetic defences; and at the Convocation of Canterbury in 1871, the testimony of the missionary bishops was given in support of the great value of this creed in the instruction of the heathen. The points in this creed that give offence to some are defended by others, on the plea that it was not drawn up for the sake of gratuitously dogmatizing on abstruse speculative truths, but to counteract other dogmas which were held to be dangerously heretical. Waterland says: 'The use of it will hardly be thought superfluous so long as there are any Arians, Photinians, Sabellians, Macedonians, Apollinarians, Nestorians, or Eutychians, in these parts.' With respect to what are called the 'damnable clauses' (the clauses, namely: 'Which faith except every one do keep whole and undefiled, without doubt he shall perish everlastingly;' and: 'This is the Catholic faith, which except a man believe faithfully, he cannot be saved'), the churches which adopt the creed do not mean by them to imprecate curses, but to declare, as a logical sequence of a true faith being necessary to salvation, that those who consciously and deliberately reject the true faith are in danger of perishing; as it is said, Mark, xvi. 16, 'He that believeth not shall be damned' ('condemned' in Revised Version). These clauses are also held to apply to those who deny the substance of the Christian religion, and not infallibly to every person who may be in error as to any one particular article. A rubric to this effect was drawn up by the commissioners appointed in 1689 for the review of the English Common Prayer-book, but none of their suggestions took effect. Compare also the 18th Article of the Church of England with these clauses.

On the date of the creed much curious learning has been bestowed of late years, Professors Lumby and Swainson of Cambridge arguing for a later date between 700-800 A.D., and the Rev. W. Foulkes regarding it as a forgery. But a strong

and probably triumphant case for the earlier date (of about 450 A.D.) has been made by the Rev. G. W. Ommaney, M.A., in *The Athanasian Creed* (Lond. 1875), and a subsequent volume. The work of Waterland, *A Critical History, &c.* (Cambridge, 1724), must, however, still remain in the first rank of inquiries of this nature; and though he may not have proved St Hilary of Arles to be the author, it is now generally accepted as a Latin composition, and due to Southern Gaul, most probably about 450 A.D. For explanation of the meaning of the damatory clauses, the best recent works are a volume on the subject by Canon Malcolm MacColl (Lond. 1872), and a sermon by Dr Pusey on *Responsibility of the Intellect in Matters of Faith* (Lond. 1873).

Athanasius, Primate of Egypt, was born in Alexandria about the year 296 A.D. There are no particulars on record of his lineage or his parents. Alexander, then officiating as primate or patriarch of Alexandria, brought him up in his own family, and superintended his education, with the view of his entering on the Christian ministry. In his youth, he often visited the celebrated hermit St Antony, and embraced for a time the ascetic life with the venerable recluse. He was only a deacon when appointed a member of the first general council at Nice (325), in which he distinguished himself by his erudition and his eloquence.

His patron, Alexander, having died in the following year, he was duly elected to the primacy by the clergy and people; and was but newly installed in his office, when Arius, who had been banished at the time of the condemnation of his doctrine at Nice, was recalled, and made a recantation of his erroneous principles. Athanasius, it is said, refused on this occasion to comply with the will of the emperor that the heretic should be restored to communion. On this account, and in consequence of several other charges brought against him by the Arian party, he was summoned by the Emperor Constantine to appear before the synod of Tyre, in 335 A.D., which deposed him from his office. The sentence was confirmed by the synod of Jerusalem in the following year, when he was banished to Augusta Trevirorum (Treves). In 338, however, he was recalled from his banishment, and restored to the primacy at Alexandria. His entrance into the city was like a triumphal procession; but the Arians soon rose against him, and (in 341) he was again condemned by a council of ninety-seven (mainly Arian) bishops, assembled at Antioch. Against this decision a protest was made by a hundred orthodox bishops at Alexandria; and in a council held at Sardica, 300 bishops, countenanced by Julius, Bishop of Rome, confirmed the decision in favour of Athanasius, who was again replaced in his office (349). The Arians once more acquired the ascendancy after Constantius (in 353) had been made emperor of both the East and the West; for in that year Athanasius was condemned by a council held at Arles, and the sentence was confirmed by another held at Milan in 355, the influence of the sovereign being strongly exerted to secure his condemnation. As the resolute patriarch had declared that he would not leave his place without an express order from the emperor, violent means were resorted to for his expulsion. While engaged in conducting divine service, he was interrupted by a company of soldiers, from whom he made his escape into the Egyptian desert. A price was set on his head; and to avoid his persecutors, he retired from the usual haunts of the anchorites to a remote desert in Upper Egypt, where he was attended by but one faithful follower. Here he wrote several works to confirm orthodox Christians

in their faith. On the accession of Julian to the imperial throne, toleration was proclaimed to all religions, and Athanasius returned to his former position as Patriarch of Alexandria (361). His next controversy was with the heathen subjects of Julian, to whom the patriarch, by his zeal in opposing their religion, had made himself very offensive. To save his life, he was compelled again to flee from Alexandria, and remained concealed in the Theban desert until 363, when Jovian ascended the throne. After holding office again as patriarch for only a short space of time, he was expelled anew by the Arians, under the Emperor Valens. Athanasius now found refuge in the tomb of his father, where he remained hidden four months, until Valens, moved by petitions from the orthodox Alexandrians, restored the patriarch to his see, in which he continued till his death in 373 A.D.

Athanasius was the leading ecclesiastic during the most trying period in the history of the early Christian Church. His ability, his conscientiousness, his judiciousness and wisdom, his fearlessness in the storms of opposition, his activity and patience, all mark him out as a conspicuous ornament of his age. Though twenty years of his life were spent either in exile, or what was equivalent to it, yet his prudence and steadfastness, combined with the support of a large party, crowned his exertions with complete success. He was a clear thinker, and as a speaker, was distinguished for extemporaneous precision, force, and persuasiveness.

His writings are polemical, historical, and moral; all marked by a style simple, cogent, and clear. The polemical works treat chiefly of the doctrines of the Trinity, the incarnation of Christ, and the divinity of the Holy Spirit.

The earliest edition of the collected works of Athanasius in the original Greek appeared in two volumes, folio, at Heidelberg in 1600. Better is the great edition by Montfaucon (1698); and the standard edition in four volumes of the Abbé Migne's great *Patrologia Græco-Latina* (1860). Athanasius' Four Orations against the Arians, and his Oration against the Gentiles, were translated by Parker (1713); his Treatise on the Incarnation of the Word, by Whiston (1713; another edition, 1880). The Epistles of Athanasius in defence of the Nicene Creed, and on the Councils of Ariminum and Seleucia, together with his first Oration against the Arians, were translated, with notes, by Cardinal Newman (1842). See the church histories by Neander and others; also works on Athanasius by Möhler (2d ed. 1844) and Böhlinger (2d ed. 1874); and Bright's edition of the Orations against the Arians. Hooker gives an eloquent and fervid eulogy of Athanasius in his *Ecclesiastical Polity* (book v.). The Duc de Broglie's narrative, in his *L'Eglise et l'Empire au IV^{ème} Siècle*, tomes i. ii. (Paris, 1856), is excellent. Canon Bright's article 'Athanasius,' in Smith's *Dictionary of Ecclesiastical Biography*, is most accurate and exhaustive. But it is singular (as Cardinal Newman has observed) that hardly any professed ecclesiastical historian has given a more lively impression of the greatness of Athanasius than the sceptical Gibbon in his *Decline and Fall of the Roman Empire*, vols. iii. and iv. See the article **ARIUS**.

Atheism is the doctrine that there is no God. The word, which first appears in English literature in the latter part of the 16th century, is derived from Gr. negative prefix *a*, and *Theos*, 'God.' The name atheist is said to have been first applied in Greek literature to one of the followers of the materialistic philosopher Democritus (q.v.). It has been doubted by Addison, Bacon, and Dr

Arnold, whether a real atheist ever existed; indeed, Addison would not have hesitated to say to any man who professed atheism that he was an impudent liar, and that he knew it. But, notwithstanding, it seems unquestionable that there have been, and that there still are such. The ancient Greeks, who detested atheism so cordially that they banished its abettors and branded their names in history, have handed down to us, with this stigma attached to them, the names of Diagoras, of Bion, and of Lucian—men who did not believe in the gods. In recent and modern times such men as La Mettrie, Von Holbach, Feuerbach, and Gustave Flourens—to name no others—have advocated this doctrine in the most explicit manner; and when, for example, Feuerbach says: 'It is clear as the sun, and as evident as the day, that there is no God;' or, when Flourens wrote these words: 'Our enemy is God' . . . 'Hatred of God is the beginning of wisdom' . . . 'If mankind would make true progress, it must be on the basis of atheism,' there seems no reason to doubt that their language may be regarded as expressing their real sentiments.

There are three forms of argument employed in the advocacy of atheism—viz. the *dogmatic*, which positively asserts that there is no God; the *sceptical*, which maintains that the finite mind of man is incapable of ascertaining whether there is a Divine Being or not; and the *critical*, which holds that the evidences adduced in support of Theism (q.v.) are inadequate. The first of these—the dogmatic—has now fallen largely into disrepute. In Britain, this is largely owing to the trenchant reasoning of John Foster, and subsequently of Dr Chalmers. These writers set themselves to show that dogmatic atheism is a palpable absurdity. Before any man is entitled to assert that there is no evidence of the existence of God, he must, they argue, explore all parts of the universe; for evidence that would convince even *him* may be extant somewhere. To prove a negative is proverbially difficult; but to prove *this* one, nothing short of omniscience and omnipresence would be requisite. Modern non-believers in the existence of God cautiously restrict themselves to the sceptical and the critical methods, and, instead of positively asserting that there is no God, they argue in favour of Agnosticism (q.v.). The relation of atheists to oaths in courts and in parliament is discussed at OATHS. See also the articles GOD, APOLOGETICS.

Atheling (Old Eng. *Æthel*, 'noble'), a title of honour among the Anglo-Saxons, which, at first applied to the descendants of the primitive nobles of the first settlement, gradually became confined to the princes of the blood royal, and, in the 9th and 10th centuries, exclusively to the sons and brothers of the reigning king.

Ath'elney, ISLE OF, a marsh at the junction of the rivers Tone and Parret, in the middle of Somersetshire, about 7 miles from Taunton. Here Alfred hid himself for nearly a year when driven from his throne by the Danes in 878, and here he founded, in 888, a Benedictine abbey, now entirely gone. Among the many relics found in this spot is a ring of Alfred's, preserved in the Oxford Museum. The name Athelney means 'island of the nobles,' or 'royal island.'

Athelstan, son of King Edward the Elder, and grandson of Alfred the Great, was born about 895 A.D., and was crowned king of the Mercians and West Saxons at Kingston-upon-Thames in 925. He conquered portions of Cornwall and Wales, and, on the death of Sihtric, king of Northumbria, who had married one of his daughters, made his successor tributary. In 937,

a league, composed of Welsh, Scots, and Danes, was formed against him; and a fierce and decisive battle was fought at Brunanburh (q.v.), in which the allies were utterly defeated, and which became famous in old English song. After this, the reputation of Athelstan, now practically king of all England, spread into the Continent; one of his sisters married Otto the Great, afterwards emperor; another, Hugh, Duke of the French, father of Hugh Capet. At home he exhibited a deep interest in the welfare of his people, improved the laws, built monasteries, and promoted commerce. He died in 941.

Athēna, or PALLAS ATHENA, one of the greater Greek divinities, forming, with Zeus and Apollo, the supreme triad in Greek mythology. Of her origin and parentage different accounts are given, probably from the confusion of various local legends; but the best-known version of the myth represented her as the daughter of Zeus and Mētis. Zeus, we are told, when he had attained supreme power after his victory over the Titans, chose for his first wife Metis ('wisdom'); but being advised by both Uranus ('heaven') and Gæa ('earth'), he swallowed her when she was pregnant with Athena. When the time came that Athena should have been born, Zeus felt great pains in his head, and caused Hephæstus (Vulcan) to split it with an axe, whereupon the goddess sprang forth—fully armed, according to the later stories. Under the gross accretions which conceal the significance of the myth, we may see in this account of Athena's parentage an effort to set forth a divine symbol of the combination of power and wisdom. Her father was the greatest, her mother the wisest of the gods. She is literally born of both, and so their qualities harmoniously blend in her. She is the personified reason, the wisdom of the divine father; while Apollo, no less beloved of Zeus, is his mouth, the revealer of his counsel. She is a maiden goddess, everlastingly young and fair. Though her heart is inaccessible to the passion of love, she is not a cold unfeeling divinity, but interests herself warmly in the affairs of both gods and men. She is the patroness of agriculture, the inventor of the plough and rake, the first to introduce the olive into Attica, and (in harmony with her character as the personification of active wisdom) to teach men the use of almost all the implements of industry and art; and she is said to have devised nearly all feminine employments. Philosophy, poetry, and oratory are also under her care. She is the especial patroness of the Athenian state, protects its liberties by her power and wisdom, maintains the authority of law and justice in her courts, and was believed to have instituted the court of justice on Mars' Hill (the Areopagus). The industries of its citizens are dear to her—she is the 'workmistress' (*Erganē*), the goddess of all useful and elegant arts. As a warlike divinity, she approves of those wars only which are undertaken for the public good, and conducted with prudence; and thus she is regarded as the protectress in battle of those heroes who are distinguished as well for their wisdom as their valour. In the Trojan wars she favoured the Greeks, and in the war of Zeus against the giants she assisted her father with her counsel, killed the giant Pallas, and buried Enceladus under the island of Sicily. Her worship was universal in Greece, and representations of her in statues, busts, coins, reliefs, and vase-paintings are numerous. She is always dressed, generally in a Spartan tunic, with a cloak over it, and wears a helmet adorned with figures of different animals; her ægis, the round Argolic shield, has in its centre the head of Medusa. Her countenance is beautiful, earnest, and thoughtful, and the whole figure

majestic. One of the two masterpieces of Phidias was his great statue of the virgin Athena, on the Parthenon at Athens. In it were combined chastity with gentleness, victorious strength with calm peace, profound wisdom with perfect simplicity. It was not only a production of the highest art, but at the same time the expression of a profound religious idea. From Greece her worship was carried to greater Greece, and many temples were erected in her honour. In Italy proper she was identified with Minerva, a native goddess of wisdom, and worshipped with Jupiter and Juno.

Athenæum (Gr. *Athēnaion*), originally a Temple of Athena (Lat. *Minerva*), afterwards a kind of college or institution for higher education. The first at Rome was that founded by the Emperor Hadrian about 133, for the study of poetry and rhetoric, with a regular staff of professors. It existed as the *Schola Romana* until the 5th century. Similar institutions flourished in the provinces also, as at Lyons and Nîmes. Theodosius II. founded one at Constantinople for the eastern world. In modern times the name has been revived as an appellation for certain literary institutions, as that at Marseilles, and also as a collective title for literary essays and reviews. The weekly journal of literature, science, and art, published in London under this name, is well known. It commenced in 1827.

Athenæus, a Greek writer, born at Naucratis in Egypt. He lived first at Alexandria and afterwards at Rome about the close of the 2d and beginning of the 3d century. His work, entitled *Deipnosophistæ* ('Banquet of the Learned'), in fifteen books, but of which we possess only the first two, and parts of the third, eleventh, and fifteenth, in an abridged form, is very interesting as one of the earliest collections of *Ana*. It consists of extracts from more than 1500 books, put in the form of table-talk at an imaginary banquet, at which Galen the physician and Ulpian the jurist are among the guests. Every possible subject is introduced and illustrated by fragments from the poets, dramatists, and philosophers; but of the learned author's thousand and one interests, gastronomy seems to have been the dearest. But he loved 'titbits' of scandal no less than of cookery, for he tells many stories to the discredit of people whom history praises, which of course we are not by any means bound to believe. His dialogue is prolix and lumbering; and his work is not irradiated by a single gleam of genius, and has only achieved immortality through being a storehouse of miscellaneous information that otherwise would have been lost. The best editions are by Schweighäuser (14 vols. 1801-7), Dindorf (3 vols. 1827), Meineke (4 vols. 1859-67). There is an English translation of Athenæus (3 vols. 1854).

Athenagoras, an early Christian philosopher, who taught first at Athens, and afterwards at Alexandria. He is the most elegant writer among the so-called apologists in the second half of the 2d century, and we possess two writings from his pen—his *Legatio pro Christianis*, addressed to the Emperor Marcus Aurelius and his son Commodus, composed about 163, and *De Resurrectione Mortuorum*, written about 180. In these he defends the Christians against the heathen charges of atheism, incest, and cannibalism with great clearness and convincing power.

Athenais, an Athenian lady of distinguished beauty and learning, who in 421 A.D. became the wife of the Emperor Theodosius II., and assumed the name of Eudocia (q.v.).

Athens, the capital of Attica, the metropolis of ancient Greek culture, takes its name, probably, from Athena (q.v.), 'goddess of science, arts, and arms,' who from earliest times was the patron divinity of the city. Cecropia, from the mythical king and hero Cecrops, the city was also called in ancient times.

Athens owes its original location, doubtless, to the craggy rock known as the Acropolis (q.v.), that rises more than 500 feet high above the Attic plain, and that in earliest days served for citadel as well as for residence and site of sanctuaries. With the growth of the population, the parts below and adjacent to the Acropolis, especially on the western and southern slopes, became inhabited.

Prior, however, to this earliest period in the history of Athens as a Greek city, it is held by many that there was a settlement of Phœnicians on the slopes of the hills towards the sea, numerous remains of which, in the form of cellars, cisterns, graves, steps, seats, all cut into the native rock, are still to be seen, constituting what is generally known as 'The Rock City.' That the Phœnicians visited these coasts for commerce in the 13th century before our era, that they were the teachers of the Greeks in various arts, and that they introduced into Attica the cultivation of the olive-tree, so well suited to the dry and chalky soil of this land, are generally accepted facts.

To understand the subsequent history and growth of Athens, it is necessary first to take into view the natural advantages of its position. Few cities, if any, can boast a more beautiful situation.

The Attic plain, which immediately surrounds the city on the east, north, and west, is bounded by the range of Hymettus (3368 feet), famous for its purple tints, on the east; by Pentelicus (3641 feet), noted for its quarries of marble, rich even to-day, on the north-east; by the range of Parnes (4634 feet), well wooded at the base, but barren at the summit, on the north; by the lower and nearer range of Corydallus (1535 feet), extending to the bay of Salamis, on the north-west; and on the west and south by the Saronic Gulf, in whose waters lie, in plain sight, the islands of Salamis and Ægina. The site of the city is itself diversified by several hills which add greatly to the beauty of the scenery.

Standing upon the Acropolis one sees to the east Mount Lycabettus, a conical-shaped mount 911 feet high, on whose summit Zeus once had a sanctuary where now stands a small chapel dedicated to St George, the patron saint of the modern Greeks. To the south-west rises the hill of the Muses, or the Mouseion, surmounted now by the ruins of a monument to Philopappus, who was Roman consul about 100 B.C. In the side of the Mouseion are three rocky chambers, doubtless ancient sepulchres, but popularly known as the 'Prison of Socrates,' according to a tradition that goes no farther back than the middle ages. Immediately adjacent to this is a lower eminence called the hill of the Pnyx, from the fact that on its slope tradition locates the place of popular assembly. At the upper end of the terrace, which is supported below by a wall of polygonal masonry, stands a cube of rock surrounded at the base by steps. This has long been supposed to be the ancient *bēma* or tribunal of the assembly—an opinion not held by many recent scholars, who take it to be a great rock altar, probably dedicated to the worship of the 'Highest Zeus,' to whom many votive tablets have been found in the neighbourhood.

Just below the western foot of the Acropolis lies the rocky hill called the Areopagus or hill of Ares (Mars), so named from the myth according to which Ares was tried for the murder of Hallirotios before the twelve gods of Olympus, who held court on this

eminence. It was here that the most venerable court of Athens had its sittings to try cases of wilful murder, to exercise judicial censorship over the life of the citizens, and to guard the sanctity of

ancient law and tradition, particularly such as pertained to religion. Before this court, or at least on this hill, the apostle Paul delivered his well-known vindication of the Christian faith recorded in Acts, xvii. Just beyond the Areopagus, with a narrow valley between, lies the Hill of the Nymphs, once occupied by sanctuaries and dwellings, and now the site of the astronomical observatory. The view beyond includes the harbours of Phalerum, Munychia, Zea, and the Piræus (q.v.). The superior position and greater extent of the last-named harbour have made it, ever since the days of Themistocles, the seaport of Athens. To the south and east of the city flows the Ilissus, and to the north and west the less celebrated but more copious Cephissus. In the summer both streams are nearly dry, and at no time are they large enough to deserve the name of river. They are of great value, however, in the winter and spring for irrigating the vineyards and olive-groves that cover the plain. The most famous spot in the plain is the grove of the hero Academus, situated about a mile north-west of the city, where the 'divine Plato' taught his philosophy and founded his school, which has become famous under the name of the *Academy* (q.v.). Adjoining this grove is a knoll called *Colonus*, in the ancient *demos* of that name, famous as the birthplace of the tragic poet Sophocles, who celebrates the beauty of this region in one of the finest of the odes in his tragedy of *Œdipus at Colonus*. On this hillock are the tombs of two of the most distinguished of modern archaeologists, Ottfried Müller and Charles Lenormant.

That a city so beautifully situated, enjoying a delightful climate the greater part of the year, under a sky wonderful for its clearness (as Euripides says of the Athenians of old, 'marching through an ether of surpassing brightness'), inhabited by a race so gifted as were the ancient Ionian Greeks, should play an important rôle in history, is not at all surprising. The history of the city may be most conveniently narrated by dividing it into four epochs: (1) The period from the time of Cecrops

to the battle of Plataea, 479 B.C. (2) The most flourishing period of Athens, extending to the close of the Peloponnesian war, 403 B.C. (3) The decline of Athens, embracing the Alexandrian, Roman, Byzantine, Frankish, and Ottoman periods. (4) Modern Athens.

(1) The oldest history of Athens as a city is connected with the reforms of Theseus and Solon. Theseus was a mythical hero to whom, as his name may indicate, was attributed the credit of organising the scattered population of Attica into communities and of instituting several of the most important Athenian festivals. At this time the Acropolis was the abode of the king and the priests, and was the site of the Prytaneum or town-hall, as well as of the sanctuaries and altars of Athena, Erechtheus, Zeus, and Poseidon.

In the 6th century B.C., under the reforms of Solon and the fostering hand of the tyrant Pisistratus, Athens fairly began her prosperous career. Amid much that is mythical in the history of the reforms of Solon, it is certain that he gave a new place to the *demos* as the unit and centre of political life, and to the *ecclesia* or popular assembly, before which all acts of government were to be brought for discussion and approval. By him also the populace was divided for political purposes on a property basis into four classes, of which the first three were eligible to office. At this time the chief rule was already lodged in the hands of nine archons who were chosen annually. To the family of Pisistratus Athens owes the earliest structures that were at all beautiful or imposing. On the Acropolis Pisistratus erected a temple in honour of Athena, which was destroyed by the Persians, and some architectural remains of which are still seen built into the northern wall of the Acropolis. There are some who believe that the foundations of a large temple, recently exhumed between the Parthenon and the Erechtheum, are the ruins of this Pisistratean structure. Still more imposing was the temple begun by Pisistratus on the bank of the Ilissus in honour of Olympian Zeus, and ever since known as the Olympium. Within a peribolus of four stadia a structure was reared whose dimensions afterward became 354 feet in length, 171 in breadth, and which when completed was adorned with 120 columns of Pentelic marble, 60 feet in height and 6 feet in diameter. The ruins of this colossal temple, consisting of 16 columns, most of which have an architrave, form one of the most impressive sights of Athens.

The reforms of Clisthenes in 506 B.C. gave the government of Athens a still more democratic form by making all citizens eligible to office, by enlarging the authority of the popular assembly, and by creating popular courts of justice. Doubtless these reforms stimulated the erection of new buildings for the use of the state, many of which were located about the ancient Agora, whose exact situation has been a matter of much dispute until this very day. The conflict with Persia which originated in the Ionic revolt and the destruction of Sardis in 499 B.C., indirectly led to the naval supremacy of Athens, under the wise guidance of Themistocles. In 480 B.C. the Athenians abandoned their city to the ruthless vengeance of the Persian invaders, who burnt and destroyed all its houses and temples.

(2) After the victories of Salamis and Plataea, the Athenians splendidly rebuilt their city, which now entered upon the most brilliant epoch of its career. Under the leadership of Themistocles, Cimon, and Pericles, Athens reached the zenith of her power, and became fortified by numerous walls and bulwarks, and beautified by the erection of splendid temples. To this period belong the walls around the Acropolis, and the city walls with their ninety-seven towers and ten gates, measuring a

circumference of forty-three stadia, or almost five miles. The chief gate was at the north-west, and led to the Academy. It was called the Dipylon or double gate, and its form may still be seen from

Map of the Country round Ancient Athens.

the foundations which have recently been brought to view by excavation. Just outside of this gate was the Ceramicus ('Potter's field') or ancient cemetery, where one sees to-day some of the most

beautiful sepulchral reliefs known to art. For the better defence of the city and of its harbour, Piræus, the famous 'long walls' were built by Pericles. Together with the fortifications of the Piræus, which had previously been built by Themistocles, they formed a complete fortress, sometimes denominated, on account of its length, which was about five miles, the 'Long Fortress.' The inclosure between the two parallel walls was for the larger part of the way about 550 feet wide, and formed a continuous broad street between the city and its port. Traces of these walls are still to be seen. The age of Pericles in Athenian history corresponds to the Elizabethan period in the history of England. Among the great names of this illustrious period may be mentioned Mnesicles as architect, Ictinus in architecture, Phidias and Myron as sculptors, Æschylus and Sophocles in tragedy, Socrates and Plato in philosophy, Herodotus and Thucydides as historians, and Pindar and Simonides as lyricists. Of the monuments of architecture and sculpture belonging to this period the most important are the Parthenon (q.v.), the Erechtheum, the Temple of Wingless Victory (*Nikē Apteros*), the Propylæa, the Theseum, the Choragic Monument of Lysicrates, and the statues and reliefs that adorned these structures. It is

View of the Acropolis of Athens from the Mouseion Hill, showing the ruins of the Parthenon and the Propylæa.

The arches belong to the ruins of the Odeum of Herod and other buildings of the Roman period. The hill to the right is Lycabettus.

from the contemplation of these ruins and remains that the beholder gains such a conception of the purity and exquisite grace of ancient art as he can get nowhere else. The simplest and most majestic structure of all is the Parthenon, built in the Doric style, and richly ornamented with polychromatic colouring. Its cella contained the chryselephantine statue of the virgin goddess from the hand of Phidias. Its pediments were adorned with groups of statuary representing the birth of Athena, and the contest of Poseidon and Athena for the possession of Attica. The frieze around its cella wall portrayed the procession of the Panathenaic festival. Of these sculptures the

largest part of what has been preserved was carried by Lord Elgin to the British Museum, where the collection is known as 'the Elgin Marbles' (q.v.). The temple first became a ruin in 1687, through the bombardment of the Venetians, one of whose lieutenants had the wretched good luck to send a bomb into the powder stored by the Turks in the cella. Shattered and battered though it is, the Parthenon is perhaps the most beautiful ruin in the world. Of the Erechtheum, which was built in the Ionic style, and which has a front entirely different from that of any other known temple, the most beautiful part, the so-called 'Porch of the Caryatides,' is still in fair state.

of preservation, and shows six graceful female figures supporting the architrave. The Propylæa, which formed the entrance to the Acropolis, consisted of three parts—viz. a central porch with five gates, and a north and south wing. It was the most massive secular structure of ancient Athens, but, probably through the distractions and expenditures of the Peloponnesian war, was never completed. Contiguous and in front of the south wing of the Propylæa is the Temple of Wingless Victory, built in the Ionic style and of Pentelic marble. On a slight elevation north-west of the Acropolis stands the so-called Theseum, the best preserved of all the structures of the ancient city. It was built somewhat earlier than the Parthenon, is also of the Doric order, and derives its name from the tradition that here the remains of Theseus were brought from the island of Seyros and interred. Most modern scholars believe it was a temple of Heracles or of Hephæstus. In the middle ages it served as a Christian church dedicated to St George. The gold-brown tint of the weather-stained Pentelic marble presents, in the glow of the rising or setting sun, a peculiarly beautiful effect.

In an out-of-the-way corner, south-east from the Acropolis, amid squalid surroundings, stands the graceful Choric Monument of Lysicrates. This monument owes its origin to the custom of dedicating the tripods given in the Dionysiac contests to the victorious chorus. It is in the form of a small circular temple, which served as the base of the tripod, and is one of the earliest specimens of the Corinthian architecture. On the south slope of the Acropolis was the sanctuary of Dionysus, where later was built the great theatre, the remains of which, consisting of seats hewn into the rock, marble thrones, pieces of a later proscenium, and other architectural fragments, still testify to the interest of the Athenians in the festivals of the god of the vine. Closely adjacent, on a higher terrace, lay the sanctuaries of Æsculapius, Themis, Aphrodite, and Demeter, of which little except the foundations remain.

(3) In its most flourishing period, Athens contained upwards of 10,000 dwellings, and numbered at least 100,000 free inhabitants, and more than twice as many slaves. The number of citizens who were entitled to vote and to hold office was about 20,000. The decline of Athenian power and prosperity dates from the close of the Peloponnesian war (403 B.C.), which had exhausted the resources of Athens and broken her spirit. Still, at this time there were not wanting patriots and statesmen, such as Demosthenes and Lycurgus, who secured for Athens a new though brief ascendancy among the states of Greece, and made her the bulwark of Hellenic independence, until the fatal battle of Chæronea (338 B.C.), which established the Macedonian supremacy. Lycurgus, who stood for many years at the head of the financial administration of Athens, was most active in fortifying and building up the city. A new and magnificent arsenal in the Piræus, called after its architect the arsenal of Philon, was erected under his direction, and in Athens he built a new stage structure and lined the seats of the Dionysiac theatre with marble. On the banks of the Ilissus he laid out the Stadium, used for the first time in 330 B.C. for the games of the Panathenaic festival; it had seats for no less than 45,000 persons. He enlarged and beautified the gymnasium known as the Lyceum, where Aristotle expounded his science and philosophy. During the subsequent Macedonian occupation, Demetrius of Phalerum gave the city a wise administration. Now Athens became the seat of schools of philosophy and

rhetoric, and the metropolis of polite learning. The long list of benefactors of Athens during the Alexandrian period begins with Ptolemy Philadelphus (284 B.C.), who founded a gymnasium and library which bears his name. The kings of Pergamus, Attalus and Eumenes, built markets and halls and theatres, and the Syrian Antiochus Epiphanes (175 B.C.) resumed the building of the Olympiæum, which for a long time had remained half completed. With the destruction of Corinth in 146 B.C. by the Romans, and the dissolution of the Achæan League (q.v.), Athens with the rest of Greece became a Roman province. Yet for a long time the conqueror Rome sat at the feet of the conquered Athens, to learn her art and letters, and to gain from her sages teachings of philosophy and rules of statesmanship. Of the buildings of this period should be named especially the Tower of the Winds, which served as a kind of public clock and barometer, built by Andronicus Cyrrhestes, and the Gate of the Agora. The Emperor Hadrian, probably no less through a desire to gratify his vanity than from a love of Greek culture, gave Athens a fresh revival of art and a new prosperity. An entire quarter of the city, south-east of the Acropolis, was named after him, as is attested by an inscription which can still be read on the 'Gate of Hadrian.' He finished the great Temple of Zeus begun by Pisistratus, which was thus more than 600 years in course of building. About the same time a wealthy Athenian, Herodes Atticus of Marathon, built, in honour of his wife Regilla, a magnificent theatre or odeum, the ruins of which rise conspicuously above all other remains of the ancient city at the foot of the Acropolis. But here is the turning-point. From this time onwards the history of Athens is only one of spoliation and destruction, first by Romans, then by Goths, then by Christians, and last by Mussulmans. The Athenians had to pay dearly for espousing the cause of King Mithridates against the Romans. After a long siege, the Romans under Sulla took Athens and plundered it of many works of art. In 267 A.D. the city was captured by the Goths. In the next century Constantinople began to draw works of art from Athens for her adornment. The schools of philosophy, especially the Neoplatonic, still maintained their existence, and were the support of pagan religion. At last the Emperor Justinian, in 529 A.D., closed by edict the Athenian schools of philosophy, and the light of science and learning that had been shining for so many centuries, though but dimly at the last, was now wholly extinguished. The temples were converted into churches, whereby they suffered many architectural changes. In 1019 the Emperor Basilus II. held in the Parthenon, now called Panagia, or the church of the Madonna, a religious celebration in gratitude for his victory over the northern barbarians. In 1204, after the conquest of Constantinople, Boniface de Montferrat became king of Greece. Athens was ruled by a succession of Frankish dukes until 1456, when the city fell into the hands of the Turks, under whose blighting despotism, with a brief interruption of Venetian ascendancy, it remained until the deliverance of Greece was effected in 1833 through the intervention of the great powers of Europe.

(4) With the liberation of Greece from the yoke of Turkey begins the history of Modern Athens. Before the transfer of the capital from Nauplia by King Otho, who had been chosen to the throne of the new kingdom, Athens was a wretched village of a few hundred houses. Since that time it has enjoyed a prosperous growth. Modern Athens has been built chiefly on the eastern and northern sides of the Acropolis, while the ancient city lay chiefly on the southern and western sides, and in its public

buildings and newer parts it reminds one of the better-built German cities. Its present population is about 85,000, that of the Piræus being more than 30,000. It has a gymnasium on the German model, a school for the higher education of girls, several private schools of excellent character, a polytechnic school, and a university which numbers more than 50 professors in the various faculties, and about 1400 students. A railway connects Athens with the Piræus, and tramways run to outlying villages. Except in the back streets and remote corners, one would hardly think of Athens as at all an oriental city. Its two chief business streets, 'Hermes' and 'Æolus,' cross each other at right angles, and divide the city into four nearly equal parts. Of modern public buildings the most noteworthy are the University, the Academy, which is built almost wholly of marble and shows with beautiful effect the polychromatic decorations of the ancient Doric style, the Exposition Hall, and the Palace, externally an ugly square building, but containing some spacious and handsome salons. Among the most recent erections are a magnificent building for the national library, and a fine theatre. Both these structures, as well as the Academy and the Exposition Hall, are the gifts of wealthy Greeks, who reside mostly abroad, and take this way of showing their interest in the prosperity of their native country. Athens has become a centre of archaeological interest and study. Aside from the monuments mentioned above, it has many remains of antiquity stored and exhibited in its three museums. At the eastern end of the Acropolis, the Archaeological Society of Athens has erected a low building in which are preserved the remains and fragments of ancient art that have been exhumed on the Acropolis. The most noteworthy of these are several slabs of the Parthenon frieze, a few reliefs of the beautiful balustrade of the Temple of Wingless Victory, fragments of the frieze of the Erechtheum, and the fourteen archaic statues of divinities or priestesses found in 1886 west of the Erechtheum. The museum contained in the Polytechnicum embraces the Mycenæ collection made by Dr Schliemann, a large number of figurines from Tanagra, Myrina, and other places, and a collection of vases illustrative of every period in the history of vase-painting. The National Museum is especially rich in archaic statues and in sepulchral stèles and reliefs. The Greek Archaeological Society generously affords every facility to foreign students who are pursuing archaeological studies, and is constantly expending considerable sums of money in carrying on excavations. At present the entire surface of the Acropolis is undergoing excavation under its supervision. Interest in these researches has been greatly stimulated by the planting of foreign archaeological schools at Athens, of which there are four. The French school was established in 1846, and possesses a good library and a small but choice museum. The German Institute was opened in 1873, and has been very active in carrying on researches, the results of which are published in an annual volume entitled *Mittheilungen des Deutschen Archæologischen Instituts*. The French school issues a similar publication called *Bulletin de Correspondance Hellénique*. Both these schools are supported by their respective governments. The American school was founded in 1882, and is maintained by the co-operation of twelve of the leading colleges, and by the friends of classical studies in the United States. The British school was opened in 1886, and is under the patronage of the society for the promotion of Hellenic studies. As ancient Athens was for so many centuries the intellectual centre of the world, so the undecaying interest and charm that attaches to the remains of this ancient home of art and

science, beautiful even in ruin and decay, attract more and more the student and the tourist to the 'violet-wreathed city of Athena.'—The principal Athenians are treated of in separate articles. See also GREECE, ART, SCULPTURE; and Dyer, *Ancient Athens: its History, Topography, and Remains* (Lond. 1873); Bursian, *Geographie des Griechenslands* (1873), important for antiquities and art; Wachsmuth, *Stadt Athen* (vol. i. 1874); Burnouf, *La Ville et l'Acropole d'Athènes aux diverses époques* (Par. 1877); Curtius and Kasper, *Atlas von Athen* (Berlin, 1878); Forbiger, *Griechenland im Zeitalter des Perikles* (3 vols. 1882); and Milchhöfer's, *Athen* (in Baummeister's *Denkmäler der Klassischen Altertums*, Munich, 1884).

Athens, a name applied to more than twenty places in the United States. (1) The most important of them is a thriving town in Georgia, 92 miles WNW. of Augusta. It is the terminus of a branch railway, which joins the Georgia Central. It contains several cotton factories, and is the market for an extensive cotton-growing region. It is the seat also of the university of Georgia. (1801). Pop. (1871) 4251; (1881) 6099.—(2) A town in the south of Ohio, on the Hocking River. It has considerable trade with the surrounding country, and is the seat of the Ohio University (1804), and of the state lunatic asylum. Pop. (1890) 2457.

Atherfield Clay, the lowest subdivision of the Lower Greensand (see CRETACEOUS SYSTEM) varying in thickness from 20 to 60 feet. It lies directly on the Wealden (q.v.). It takes its name from Atherfield, on the SW. coast of the Isle of Wight. It is of marine origin.

Atherine (*Atherina*), a genus of small fish allied to the Gray Mullet family (*Mugilidae*), but latterly separated into a distinct family, *Atherinidae*. The atherines have more than twice as many scales as the gray mullets; they are of a more slender form, but few of them exceed six inches in length. They have a protractile mouth and few teeth. Almost all the known species, which are numerous, and found in the seas of different parts of the world, have a broad silvery band along each side. Some of them are much esteemed for their delicacy. They occur in great shoals, and are very abundant in the Mediterranean. One species, *Atherina presbyter*, is very common on the south coast of England and on some parts of the coast of Ireland, but is rare on the east coast of Britain. In the markets of some of the southern towns

Atherine (*Atherina presbyter*).

England, where the Smelt (q.v.) is unknown, the atherine is sold under that name; in Brighton and some other places, it is called *Sand Smelt*. Where this fish abounds, it is often taken by anglers from the shore, biting readily at almost any bait. There is also a North American species of small economic importance.

Atheroma (Gr., from *athērē*, 'meal,' and *porridge*), a name formerly applied to cysts on the scalp with contents of the consistence of porridge, but now only used of a common form of inflammation of arteries. See ARTERIES (*Diseases of*).

Atherstone, an old market-town of NE. Warwickshire, 14 miles N. of Coventry and 10 miles N. of Lichfield. Lying on the Roman Watling Street, it has a grammar-school (1573), and manufactures of hab-

stockings, and ribbons. Drayton was born close by. Pop. (1881) 4645.

Atherton, a township of Lancashire, 13 miles WNW. of Manchester. There are extensive coal-mines, and the inhabitants are chiefly employed in cotton factories and iron-works. Pop. (1871) 7581; (1881) 12,602.

Athletic Sports.—I. *Classical.*—We have an account in Homer (*Iliad*, xxiii.) of the sports held at the tomb of Patroclus, in which all the best Greek athletes competed. The athletes who competed at the great Greek open meetings—the Olympian, Pythian, Nemean, and Isthmian, and the more local Panathenæan—were as a rule professionals specially trained. At first their diet was only cheese, figs, and wheaten bread, but afterwards meat was added. We are told that some of these heavy-weight athletes were great eaters, that they practised digging to strengthen their arms and shoulders, and that only very strong men could win in the *Pancratium*, a mixture of boxing and wrestling answering to the modern prize-fight. Milo of Croton is said to have slain an ox with a blow of his fist, and then eaten it in one day. Such gorging must have been fatal to athletic powers, while the other facts show that the ancient athletes must have been ignorant of 'form' and 'science.' At these great games the chief athletic competitions were long-distance races, jumping, throwing the *discus*, wrestling, boxing, and the *pancratium*. No one could compete above the age of thirty-five. The usual prizes were wreaths of bay, olive, or parsley. Cyrene was famous for its athletes, and there are in the British Museum six prize vases won by Cyrenians at the Panathenæa. Winners at the great games were fêted on their return home, and thenceforth kept at the public expense. Dishonesty was then as now not unknown, and fines were inflicted on athletes for 'selling' a race. Euthymus, Milo, Hippothenes, Polydamas, and Promachus were some of the most famous strictly professional athletes, while among the amateur winners were Plato, Pythagoras, and Cleanthes. In 186 B.C. M. Fulvius introduced athletic sports at Rome, where, though they became popular under the empire, they were always confined to Greeks.

II. *Old English.*—Excluding hunting, hawking, and similar pursuits of the rich, we may give the following as old sports of the people, mostly dating from the middle ages—namely, archery, bull and bear baiting, cock-fighting, running, jumping, throwing the bar, running at the quintain, tennis, pall-mall, broadsword, quarterstaff, bastard (blunted) sword, singletick. Quintain was engaged in by Oxford undergraduates as late as 1835. Casting the bar or the sledge-hammer, which answers to our throwing the hammer, was a favourite sport of that first-rate all-round athlete, Henry VIII. The Londoners have always been famous for their love of athletic sports. The Cotswold Games, over which R. Dover, attorney of Barton Heath, Warwick, presided, was a famous meeting in the 16th and 17th centuries. James I. gave them a special license. They were held at Dover's Hill on the NE. Cotswolds near Honeybourne, and are described in *Annalia Dubrensis* (1636) and the *Cotswold Muse*. In the *Scouring of the White Horse* (Hughes) we have an account of a similar meeting in Berks. The carnival at Halgaver Moor near Bodmin, also famous for its sports, was visited by Charles II. In Westmoreland and Cumberland athletic meetings have long been popular.

III. *Modern English.*—The oldest athletic sports are those of the Royal Military College, Sandhurst, which date from 1812. The following is a calendar of the most important dates in the history of modern athletics:

1340. Woolwich, Eton, Harrow, Rugby, and Shrewsbury began to have sports.

1853. Oct. 22, Cheltenham College held its first sports after the modern fashion, which makes a regular fête of them. Cheltenham now takes two afternoons for its sports, and is the only school which has a grand stand of its own. Eton and Harrow still have their races at intervals on various days.

1855. College Athletic Sports at Oxford and Cambridge began.

1864. Inter-Varsity (Oxford v. Cambridge) Sports established.

" Mincing Lane Athletic Club established.

1866. Amateur Athletic Championship Sports established.

1867. Irish Civil Service Sports established at Dublin.

" Mincing Lane Athletic Club renamed London Athletic Club.

Chief Athletic Clubs.—The London Athletic Club (600 members) holds six meetings in the year at its grounds at Stamford Bridge, West Brompton, and is the largest and most important athletic club in the kingdom. The Oxford and Cambridge, Civil Service, Birchfield, Liverpool, South London Harriers, Beckenham, Surbiton, and Lewes clubs are also of note.

Chief Athletic Meetings.—*London:* The Oxford and Cambridge Sports at Lillie Bridge on the Friday before the boat race; Amateur Championship, Civil Service, London Athletic Club, United Hospitals, Railway Clearing-House, and Surbiton Sports. *Provincial:* Lewes, Brighton, Scarborough, Birmingham, Liverpool, Leicester, &c. In fact, every town in England of 10,000 inhabitants or more has its athletic, bicycle, and cricket clubs and annual sports. The annexed table will show the advance made in athletic 'records' during twenty years. A record is the best authenticated performance on record up to date, and when surpassed is said to be 'cut,' 'lowered,' or 'broken.' The figures in the 1864 column refer to the Oxford and Cambridge Sports of that year. The slowness of the times twenty years ago, and the unscientific way in which records were generally kept, may be seen in the following passage from Stonehenge's book on sports of 1864, figures being substituted for letters, and the 1886 records added in brackets. 'Quarter of a mile has been run in 1 min. (48½ sec.); half a mile, in 2 min. 25 sec. (1 min. 55½ sec.); a mile, 4 min. 30 sec. to 5 min. (4 min. 18½ sec.); two miles, in rather less than 10 min. (9 min. 17½ sec.); four miles, in 20 min. 30 sec. (19 min. 39½ sec.); ten, in 1 hour (51 min. 20 sec.); fifteen, in 1 hour 35 min. (1 hour 24 min. 24 sec.); and twenty, in 2 hours 15 min. (1 hour 58 min. 44 sec.).' The figures and names in brackets in the 1886 column of the table give the records and names of professionals, between whom and amateurs an authorised distinction was first drawn in 1860 (see AMATEUR). U.S.A. means that the record was made in America.

From the table it will be seen that the American L. E. Myers holds three records, and W. G. George five; while six of the seventeen are held by American amateurs. Very few of these amateur records are older than 1880. George, who obtained the amateur as well as the professional record for a mile, lost his amateur status in 1885. We should notice among important events the dead heat between J. W. Lang, Christ Church, and C. H. Long, Trinity, in the two miles at the Oxford and Cambridge Sports in 1866, and that in the three miles between R. H. Benson (Balliol) and E. M. Hawtrey (John's), in 1872. In 1885 the three matches between W. G. George, hitherto an amateur, and Cummings of Paisley, attracted much attention. In the mile race Cummings, who had held the professional record for a mile (4 min. 16½ sec.) for years, broke down 350 yards from the winning-post, and George won in 4 min. 20½ sec. This took place at Lillie Bridge Grounds, London, August 31. In the four-mile race run at Powderhall, Edinburgh, September 12, George broke down, and Cummings, after going 3¼ miles, was stopped by

the crowd, so that no time for the four miles could be taken. In the ten-mile race run at Lillie Bridge,

September 28, Cummings won easily in 51 min. 6½ sec.

	1864.		1886.	
100 yards.....			10½, 10 sec.	L. E. Myers, U.S.A.
120 yards hurdles.....	17½ seconds.	A. Daniel.	16 seconds.	(2½ sec., H. M. Johnson, U.S.A., 1884; C. N. Jackson, 1885. C. F. Daft, 1884)

Cross-country Sports.—Rugby may be said to be the cradle of paper-chasing, and has always taken the lead among schools at that sport. Early in the century the fags carried the paper, while the preceptors, armed with horse-whips, were the huntsmen, and some even hired horses to follow the line. This, however, led to the stoppage of the sport by order from 1820–30. About 1850, paper-chases took place once a week for five months of the year, but now the runs are in February, March, and April, when football is going out and it is too cold for cricket. The chief Rugby 'run' is the Crick (12½ miles), for which the best record is 1 hour 16 min. 54 sec.

The chief London-Suburban cross-country clubs are the Thames Hare and Hounds, the South London, Blackheath, Spartan, Ranelagh, Finchley, and Hampton Court Harriers. The chief provincial are the Liverpool, Huddersfield, and Moseley Harriers, and the Oxford and Cambridge University Hare and Hounds clubs. The London clubs usually meet on Saturdays for a run over a course tolerably familiar. They either (1) make the best of their way throughout, or (2) appoint a 'pace-maker' to regulate the speed of the hounds, so as to give the feebler runners a chance, or (3), after the hares have had their 'law,' start the 'slow pack' first, and the fast pack afterwards. In the cross-country races for prizes, the trail is carefully laid beforehand by two veterans, and the runners are handicapped by time starts, each being despatched from the same starting-place. Sometimes all the competitors are started together, each being allowed so many minutes and seconds, which are deducted from the time he takes for the whole distance, and he whose time comes out the shortest is declared the winner. This is called a 'yacht race.' One of the great cross-country events is the Southern Counties Cross-country Championship meeting. That club whose first six men gets fewest marks is declared champion—e.g. at the

Kempton Park meeting (1887) the six Finley Harriers were 10, 13, 14, 16, 21, and 27 in order of merit, and so got the lowest marks of any club, 101. Most clubs enter twelve candidates at Sandown Park racecourse, 159 runners from 14 clubs started in 1884; *ib.* 161 from 14 clubs, 1885; *ib.* 183 from 16 clubs, 1886; and at Kempton Park racecourse, 159 from 14 clubs, 1887. Distance, a little over ten miles. There were a fair number of fences, but as long as runners are allowed to scramble or vault over fences, it cannot be called genuine cross-country work. The touching of a fence with the hands should be made a disqualification.

Athletics in Scotland and Ireland.—Athletic meetings proper have only lately become popular in Scotland, and are chiefly confined to the south. In the east, the chief meetings are the Edinburgh University, Edinburgh Harriers, and Inter-scholastic; and in the west, the Queen's Park and West of Scotland Sports at Glasgow. The Highland Games at Braemar, Inverness, Edinburgh, Aberdeen, Luss, the Border Games, &c. are semi-professional gatherings which include dancing as well as races, and tossing the caber, and are something like the Old English sports already noticed. No amateur record has ever been made in Scotland. In Ireland, Dublin University has always taken the lead in athletics. The Irish Civil Service Sports were established at Dublin in 1867, and now there are meetings at Belfast, Carrick-on-Suir, Galway, Kingstown, &c. The leading club is the Irish Champion Athletic Club. —Training is treated at ROWING. See also the article GYMNASTICS.

Athlone, a town in the centre of Ireland, is on both sides of the Shannon, chiefly in Westmeath but partly in Roscommon, 3 miles below Lough Ree, and 80 W. of Dublin by rail. The chief manufactures are felt-hats, friezes, linens, &c. stays. The Shannon is crossed by a fine bow-stayed and lattice iron bridge of two arches, 175 and 9

feet span. Till 1885 Athlone returned one member to parliament. Athlone Castle, founded in the reign of King John, was one of the chief military positions in Ireland. In the war of 1688 it was unsuccessfully besieged by William III. in person, but was afterwards taken by General Ginkell. The fortifications cover 15 acres, and contain barracks for 1500 men. Pop. (1881) 6755.

Ath'ole, a district in the north of Perthshire, occupying a great part of the southern slopes of the Grampians, and giving the title of duke to a branch of the Murray family. See BLAIR-ATHOLE.

A'thos (Gr. *Hagion Oros*, It. *Monte Santo*, 'Holy Hill'), the most eastern of the three tongues of the Chalcidice Peninsula on the Ægean Sea, connected with the mainland by a low and narrow isthmus, about a mile across. The length of the peninsula is about 31 miles; its breadth varies from 3 to 6 miles. At the southern extremity, a solitary peak rises abruptly to a height of 6346 feet above the sea. In ancient times, several towns were built on the peninsula, five being mentioned by Herodotus. The Persian king Xerxes cut a canal through the isthmus, to escape the stormy gales which rendered the navigation round the promontory very perilous, and which had shattered the fleet of Mardonius some years before. Traces of this canal still exist. This peninsula is celebrated as the seat of a kind of monastic republic, consisting of twenty large monasteries, besides numerous hermitages and chapels. The entire number of monks who inhabit the 'Holy Hill' is about 6000. The whole community is governed by an administrative body of four presidents, one styled 'First Man of Athos,' and a representative body called the Holy Synod, consisting of twenty members, one from each monastery. They enjoy complete autonomy, subject to paying the Turkish government an annual tribute of about £3500. The monks follow the rule of St Basil, and lead an ascetic life, restricting their diet to herbs, fruits, and fish. They are employed in agriculture, gardening, the care of bees, and the manufacture of amulets, images, crucifixes, and wooden articles of furniture, which they sell, while they also reap profits from the numerous visits of pilgrims. Caryes, the principal place in the peninsula, is picturesquely situated in the midst of vineyards and gardens, and has 1000 inhabitants. Here the market is held; but no female, even of the lower animals, is permitted to be present, or even to enter the peninsula. In the middle ages, Athos was the centre of Greek learning and Christian-Byzantine art. Now learning is at a very low ebb; scarcely more than two or three monks of tolerable education can be found in a monastery. The libraries are neglected, though containing several beautiful (but not important) old manuscripts. See Athelstan Riley's *Athos, or the Mountain of the Monks* (1887).

Athy', the chief town of County Kildare, Ireland, on the river Barrow, here joined by the Grand Canal, 45 miles SW. of Dublin by rail. It has a large grain-market. Pop. (1881) 4181.

Atitlan, a Central American lake, in the department of Solola, in Guatemala, 24 miles in length, and 8 to 10 miles in breadth. It seems to occupy the crater of an extinct volcano, and is of great depth, no soundings, it is said, being obtainable with a line of 1800 feet. It has no visible outlet, though several small streams run into it. High cliffs, almost bare of vegetation, surround the lake, and on its southern bank the volcano of Atitlan rises 12,538 feet above the sea. At the foot of the mountain lies the little Indian town of Santiago de Atitlan, with a pop. of 2000.

Atlanta, a flourishing city of the United States, capital of Georgia, and seat of justice of Fulton County, is situated 1100 feet above sea-level, on an elevated ridge dividing the waters of the Chattahoochee River from the rivers that flow into the Atlantic, 294 miles NW. of Savannah. It has a remarkably healthy and equable climate, the mean annual temperature being about 60° F. It is 7 miles SE. of the Chattahoochee River. Seven railroads centre at Atlanta, the most of which are trunk-lines with numerous connections. Atlanta has an extensive and rapidly increasing trade in cotton, dry goods, and horses and mules; and in tobacco the trade is larger than that of any place south of Richmond, Virginia.

Atlanta possesses iron-foundries and large flouring-mills, a rolling-mill, a manufactory of agricultural implements, paper-mills, three well-equipped cotton-mills, &c. The chief public buildings are the custom-house, state-house, and opera-house. An excellent system of public schools was organised in 1872, and comprises primary, grammar, and high schools for white and coloured. Other institutions are the Atlanta University for the education of coloured young men and women, Clark Theological School (coloured Methodist), and two medical colleges. The city limits comprise a perfect circle, with a diameter of 3 miles, and with its centre at the Union Passenger Depot. In the civil war, the city was captured by the Union troops under General Sherman (September 2, 1864), and the entire business portion was destroyed by them on leaving it about a month later. Since the restoration of peace, however, its prosperity has been uninterrupted and its growth rapid.

Atlanta was settled in 1840; was incorporated as the village of Marthasville in 1842; as Atlanta, in 1847. Pop. (1850) 2572; (1860) 9554; (1870) 21,879; (1880) 37,409; (1890) 65,533. A great cotton 'Exposition' was held here in 1881.

Atlantes, in Architecture, so called by the Greeks in reference to the mythical Atlas (q.v.), are male figures used instead of columns. The Romans called them Telamones. Female figures employed in this way are called Caryatides (q.v.).

Atlantic City, a fashionable American health-resort, is situated on a narrow, sandy island off the coast of New Jersey, 60 miles SE. of Philadelphia by rail. A good beach attracts a large number of summer visitors. Incorporated in 1854, the place has grown rapidly; its wide avenues are now lined with handsome cottages and villas, and lit with the electric light. Pop. (1870) 1043; (1890) 13,055.

Atlantic Ocean. The Atlantic Ocean, so called either from Mount Atlas or from the fabulous island of Atlantis, separates the Old from the New World, Europe and Africa being on the E., and North and South America on the W. Its greatest width is about 5000 miles, but between Brazil and the African coast the distance is only about 1600 miles. It is in open communication with both the Arctic Ocean and Antarctic or Southern Ocean. The North Atlantic, stretching from 70° N. to the

Atlas Column,
from the Baths at Pompeii.

equator, has an area of 14,000,000 sq. m. It communicates with many inclosed or partially inclosed seas, such as the Caribbean Sea, Gulf of Mexico,

Section of the North Atlantic Ocean, across the Gulf Stream, between New York and Bermuda:

Showing the Soundings (in fathoms) and Isothermal Lines obtained in H.M.S. *Challenger*. The vertical scale, as compared with the horizontal, is as 400 to 1; so that the inclines are 400 times less steep than represented. It was necessary to adopt this exaggerated scale in order to show the relative position of the Isothermal Lines.

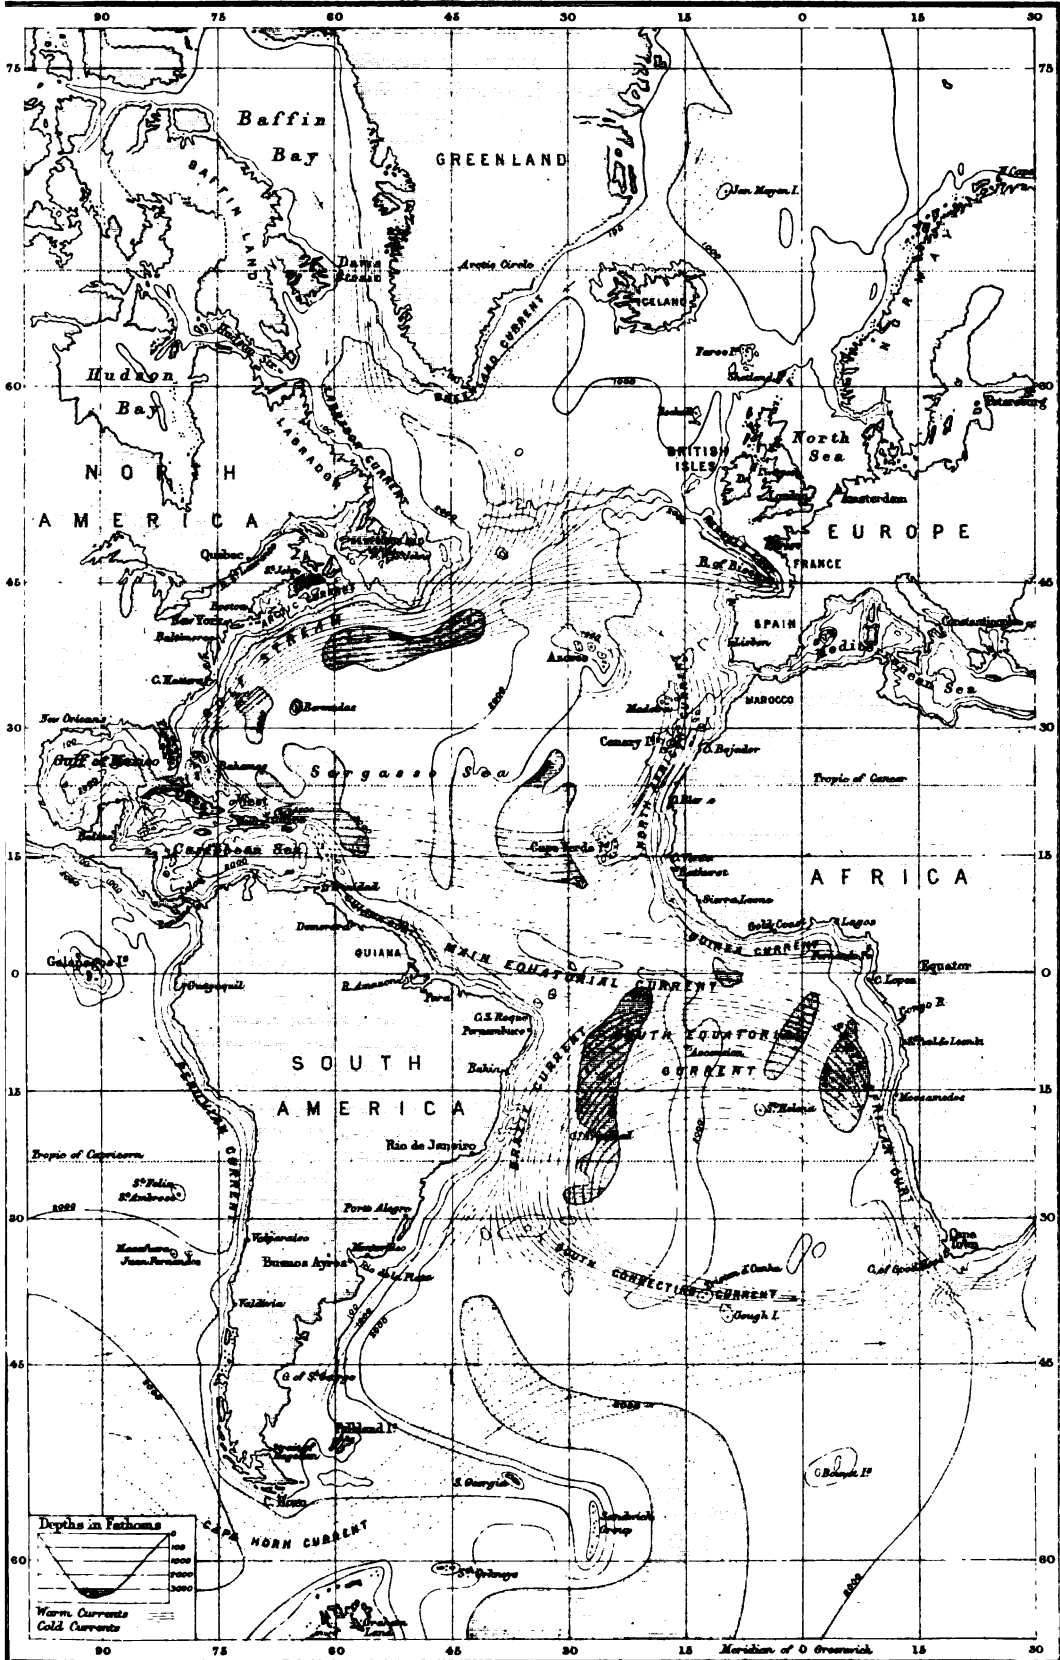

and Hudson Bay on the west, the Baltic, North Sea, Mediterranean, and Black Sea on the east, whose combined areas are about 3,400,000 sq. m. The South Atlantic from the equator to 40° S. has an area of 10,100,000 sq. m.; if it be supposed to extend through the great Southern Ocean as far as the Antarctic circle, its area is 16,700,000 sq. m. Including the Arctic Ocean and the other seas with which it is in open communication, the Atlantic has a drainage area of 26,400,000 sq. m. On this land, draining directly or indirectly into the Atlantic, Mr Murray estimates there is a rainfall of 15,800 cubic miles annually, and that the annual discharge of rivers into the Atlantic is 3400 cubic miles of water, equal to about one-half the rainfall and river discharge of the world.

Towards the centre of the North Atlantic, between Africa and North America, and in the centre of the South Atlantic, between Africa and South America, there are anticyclonic areas of high atmospheric pressure (over 30 inches), out of which winds blow in all directions to surrounding regions where the pressure is less. For instance, to the westward of North Africa, the prevailing winds are northerly and north-westerly; on the south side of the anticyclonic region they are easterly; and on the west, off the North American coast, they are southerly. A similar system of winds prevails in the South Atlantic. The positions of these high-pressure areas and the winds that blow out from them, determine

the great oceanic currents and the positions of the Sargasso seas, for the winds everywhere determine and control the movements of the surface waters. The SE. and NE. trades drive the heated surface waters of the tropics before them, and eventually produce the *Equatorial current*, which on reaching Cape St Roque bifurcates, one branch becoming the *Brazil current* of the South Atlantic, the other and larger branch passing on to the Caribbean Sea and Gulf of Mexico, finally issuing from the latter by the Strait of Florida, forming the *Gulf Stream*, the greatest and most important of all oceanic currents. The Gulf Stream spreads out over the Atlantic to the south of Newfoundland; one prolongation of it returns to the tropics off the coasts of Spain and Africa, the other passes north between the British Isles and Iceland, and on to the coasts of Norway, which are thus rendered habitable, while the opposite coasts of Greenland are ice-bound. A cold Arctic current passes southward along the shores of Greenland, and unites off Cape Farewell with the Davis Strait current, forming the *Labrador current*, which passes along the west coast of America, and passes beneath the Gulf Stream to the south of the banks of Newfoundland. Icebergs are carried as far south as 40° N. in the northern and as far north as 38° S. in the southern hemisphere. In the equatorial regions, the surface water has generally a temperature ranging from 70° to 84° F.; the temperature decreases as the depth increases, the coldest water being found at the bottom. The warm water is a relatively thin stratum, the greater part of ocean water having a temperature below 40° F. It is ice-cold in the Atlantic at the bottom even beneath the equator; the ooze dredged from the bottom beneath a tropical sun is so cold that the hand cannot be placed in it without great discomfort. The low temperature of deep ocean water is acquired in the polar regions chiefly in the high latitudes of the southern hemisphere.

The warm salt water carried into the North Atlantic by the Gulf Stream slowly sinks on account of the reduction of temperature on reaching higher latitudes, and carries heat down with it, consequently relatively warm water is found at a greater depth in the North Atlantic than in any other ocean. A temperature of 45° is found off the north of Scotland at a depth of 600 fathoms (three-fourths of a mile), while off the west coast of Africa a similar temperature is met with at only 200 fathoms beneath the surface. The temperature of the ocean is colder off the leeward shores of continents than on the weather shores, as the cold deep water is drawn up to the surface to supply the place of that driven before the winds: this is probably the reason why coral reefs are absent in the eastern parts of the ocean in the tropics, while they flourish in the western. The water of the Atlantic is freshest—that is, contains the least salt—towards the poles and in the equatorial belt of calms. The saltiest water (density over 1.0275) is found in the centre of the trade-wind regions. This is not, however, so salt as the Mediterranean and Red Sea (over 1.0280). The salinity of the deeper waters is considerably below the average of the surface. The average depth of the Atlantic is between 2 and 3 miles (2200 fathoms). A low submarine ridge runs down the centre, from north to south, with an average depth of about 1700 fathoms over it. On either side of this ridge there are, both in the North and South Atlantic, depths of between 3000 and 4000 fathoms. The greatest depth yet met with is just north of the Virgin Islands, where a sounding of 4561 fathoms has been obtained. The deposits towards the central portions of the Atlantic are chiefly made up of the dead calcareous shells of

ATLANTIC OCEAN

organisms which have fallen from the surface. On the central elevation, where the depths are less than 1500 fathoms, the deposits are largely made up of the shells of pelagic Molluscs, and the deposits are called *Pteropod ooze*; from 1500 to 3000 fathoms, the shells of pelagic Foraminifera prevail, and the deposits are named *Globigerina ooze*. In depths greater than 3000 fathoms there is a reddish clay, chiefly made up of disintegrated pumice and other volcanic material. Near the shores there is a mixture of land debris and surface organisms, and the deposits are red and blue muds, green glauconitic muds and sands, coral and volcanic muds and sands. The surface waters from equator to poles swarm with all kinds of pelagic plants and animals, many of which emit phosphorescent light, producing what is known as luminosity of the sea. In the centre of the North Atlantic, in the so-called Sargasso Sea, there are enormous floating banks of kelp weed (*Sargassum bucciferum*), on which a large number of peculiar animals live. Life has been found to exist at all depths in the Atlantic, but it becomes less abundant as greater depths and a greater distance from continental shores are reached. There are relatively few oceanic islands. Iceland, the Azores, St Paul's Rocks, Ascension, and the Tristan da Cunha group all rise from the central elevation, and are all of volcanic origin. Jan Mayen rises from the deep water of the Norwegian Sea. The coral group of Bermudas rises from the deep water of the Western North Atlantic. Off the west coast of Africa are the Canaries, Cape Verdes, and Madeira. In the South Atlantic, to the west of the central ridge, are Fernando Noronha and Trinidad, and to the east of the central ridge, St Helena. There are numerous continental islands, such as the British Isles, Newfoundland, the West Indies, the Falklands, and others. The most civilised nations of the world inhabit the shores of the Atlantic, and it is the great commercial highway of the world. Its coasts are better surveyed, better provided with lighthouses, and its winds and currents better known than those of any other ocean. It has been sounded in all directions, and the nature of its bed is so well known that telegraph cables can be laid across it with great certainty of success. In the neighbourhood of some continental shores, and around some of the volcanic cones which rise from the floor of the ocean, there are occasionally very steep slopes; but as a rule, the bed of the ocean is a widespread, gently undulating plain. The GULF STREAM has a separate article (q.v.).

Atlantic Telegraph. The union of the Old and New Worlds by means of the electric telegraph, probably the boldest feat of electric engineering ever projected, was first suggested by Professor Morse in 1843. Various reasons prevented his ideas taking practical shape, the principal obstacle being the unknown depth of the Atlantic and the supposed rocky nature of the bottom. When, however, Lieutenant Maury of the United States navy discovered that between Ireland and Newfoundland the bed of the ocean was nearly level and covered with soft ooze, and Mr Cyrus Field and others had thoroughly discussed the practical methods, a company was formed for the purpose in 1856, to which the governments of Great Britain and the United States gave liberal guarantees.

This company, after a fruitless attempt to lay an electric cable in 1857, finally succeeded in 1858.

The cable, 2500 miles long, and weighing one ton per mile, was composed of seven fine copper wires, cased in gutta-percha, contained in a casing of hemp saturated with pitch, beeswax, and oil, the outer sheath being composed of eighteen strands of seven iron wires each. It was taken, in equal portions, on board H.M.S. *Agamemnon* (91 guns)

and the United States frigate *Niagara*, spliced in mid-ocean, and finally landed; the one end by the *Agamemnon* at Valentia, Ireland; the other by the *Niagara* at Trinity Bay, Newfoundland.

The result was not encouraging. The current obtained through the wire was so weak that a congratulatory message from the Queen to the president, consisting of 90 words, took 67 minutes to transmit. After a few more messages the cable became useless.

In consequence of this failure, it was not until 1865 that capital was found to make another attempt. This time the cable was made still heavier, and the whole length, 2300 miles, weighing 4000 tons, was shipped on board one vessel, the *Great Eastern*. The paying-out journey was commenced at Valentia, but when the vessel was 1064 miles from that port, the cable broke from an accidental strain. After a fruitless effort to fish up the broken cable from the bottom, it was abandoned for the season. In 1866 another line, so modified in construction as to be both lighter and stronger than the previous one, was successfully laid by the *Great Eastern*. The 1865 cable was then, by means of the same vessel, grappled for, and brought up from a depth of two miles, spliced, and completed to Trinity Bay.

The practicability of laying an electric wire across the Atlantic being thus demonstrated, many lines have been projected, and several of them carried out. In 1869 a French company laid a line from Brest to St Pierre, off the south of Newfoundland. In 1873 a line was begun from Lisbon to Pernambuco in South America. This line, by means of a duplicate line from London to Lisbon, brings this country into direct communication with the whole of South America. Other two cables were laid from Valentia to Trinity Bay in 1874 and 1875. The latter, made by the Messrs Siemens, weighed only 880 pounds per mile, being the lightest cable planned for Atlantic telegraphy. One from Penzance to St Pierre was laid in 1879; another from England to Panama was completed in 1882; and in 1884 Messrs Bennett and Mackay's line was laid from Valentia to Torbay in Nova Scotia.

This multiplicity of Atlantic telegraph lines has had the usual effect of competition, in reducing the rates for the transmission of messages. When the first line was opened for messages, the rates were £20 for 20 words of 5 letters each, and 20s. for every 5 letters extra. The following year those rates were halved, and by successive reductions reached in August 1869 the rate of £1, 10s. for 10 words, and 3s. per word extra without restriction of number of letters. This rate has prevailed since, subject to occasional fluctuations consequent on disputes among the competing lines. One of these disputes caused in 1887 a reduction of the rates to 6d. per word on the part of all companies except one, which charged 1s. Still, even at the cheapest rates, long messages are very expensive. To obviate this as far as possible, several code and cipher schemes have been devised for transmitting lengthy messages by a comparatively small number of words. These schemes, subject to certain regulations, have been accepted by the post-offices and telegraph companies. The whole Atlantic system is worked in connection with the ordinary telegraph system of the world, and, with the lines to India and Australia, may be said to bring the uttermost ends of the earth within speaking distance.

See article TELEGRAPH for an account of the science and methods employed, and for the subject of Submarine Telegraphy.

Atlantis, according to ancient myth or tradition, the name of a vast island in the Atlantic Ocean. It is first mentioned by Plato in the *Timæus* and the *Kritias*. An Egyptian priest is

said to have told Solon of its existence, lying off the Pillars of Hercules in the ocean, and larger than Libya and Asia Minor together. In consequence of an earthquake, it is said to have been engulfed by the waves, nine thousand years before his time, at the close of a long contest which its inhabitants maintained against the Athenians. Plato says that shoals of sand marked the site of the submerged island. Some have thought that the Canary Isles are the remains of this sunken island. Bircherod, in his treatise *De Orbe Novo non Novo* (Aldorf, 1685), maintained that Phœnician or Carthaginian trading ships driven by storm had reached the American coast, and had returned thence bringing with them marvellous tales of the New World, which proved the basis of the widespread belief in Atlantis. It is remarkable that recent paleontological researches should have established the fact of there having really existed an Atlantis in Tertiary times. The Tertiary shells of the United States are identical with a whole series of fossils in the same beds of France. Also the Tertiary vertebrate animals in France have their analogues either in fossil creatures or in living species in America. On this account geologists are justified in concluding that in the Tertiary epoch a land connection existed between the two continents. The fossil flora of the two continents gives like results. Finally, Collomb and Verneuil have collected evidence to show that there actually did exist an enormous island to the west of Spain, whose rivers formed the vast marshy and delta deposits of the Tertiary period in Spain. This is, however, a pure coincidence. It is impossible to suppose any tradition existing of such an island or land. It must be remembered that the whole Celtic family held to a belief in the Land of the Dead being situated beyond the Western Sea, which they called Glasinnis, or Avalon, and of which they told wondrous tales. Such stories may have reached the Greeks, and indeed we know they did, and were taken up by them and adopted into their mythology. They called this imaginary land in the ocean the Gardens of the Hesperides, or Isles of the Blessed. There can be little doubt that Plato's Atlantis is but another name for the same imaginary land, which is also spoken of on hearsay by Pliny, Diodorus, and Arnobius. In Lucian's masterpiece of wit and satire, the *True History*, the first place reached by the travellers is an island eighty days' sail westwards of the Pillars of Hercules. The *New Atlantis* of Bacon's imagination was an austral rather than a western continent, and the curious might recognise in it the modern Australia. The first stage in the journey to Campanella's 'City of the Sun' was a great southern continent, but the want of exploration under the Antarctic circle has left this still a mere imagination.

Atlantosaurius, a name given by Professor Marsh to what appears to be the largest deinosaurian reptile of which any remains have been preserved. The femur of this colossal monster is more than 8 feet in length. The size of the bone indicates a length for the animal of nearly 100 feet, and a height of 30 feet or thereabout. The remains were obtained in the Jurassic strata of Colorado.

Atlas, in Greek Mythology, son of the Titan Iapetus and Clymene, and brother of Prometheus and Epimetheus. He was father of the Pleiades and the Hyades. As leader of the Titans, he attempted to storm the heavens, and for this supreme treason was condemned by Zeus to bear the vault of heaven on his head and hands, in the neighbourhood of the Hesperides at the western extremity of the earth, where day and night meet,

on the mountains in the north-west of Africa still called by his name. Some supposed, however, that he was originally a man metamorphosed into a mountain; and Ovid explains that Persens changed him by means of Medusa's head into stone for his inhospitality. Some tried to rationalise the myth, explaining Atlas as a mighty king who had great skill in astronomy, and only tried to storm heaven intellectually.

Mercator, in the 16th century, gave the name *Atlas* to a collection of maps; probably because the figure of Atlas supporting the heavens had been given on the title-pages of such works. The name is also applied to a collection of illustrative plates, large engravings, or a conspectus of any subject arranged in tabular form. See MAP.

Atlas, the great mountain-system of North-western Africa, stretching from Cape Nun in Morocco to Cape Bon in Tunis, a distance of about 1400 miles. It is not properly a mountain-chain, but rather a very irregular mountainous mass of land formed of many chains running in various directions, meeting in mountain-knots, or connected by short chains of inferior height, and diversified still further by several solitary mountains and groups of mountains. The general direction is from south-west to north-east. Some limit the Atlas proper to Morocco, refusing to include the Algerian heights within the system. The French geographers apply to the latter the names of the Great and the Little Atlas—the native name is Idrar-n-Deren. At any rate the principal chain, *Jebel Atlas*, is entirely within Morocco, forming a three-sided watershed to the Mediterranean, the Atlantic, and the Sahara. The Atlas attains its greatest height (about 13,000 feet) in Miltain—27 miles SE. of the city of Morocco—Bibawan, and Tagherain. The most southern chain diverging here from the central mass bears the name *Jebel Hadnar*. The heights approach the sea, and form the promontories jutting out into the Atlantic. From Morocco, the Atlas gradually decreases in height towards the east. In Algeria, the elevation is only 7673 feet; in Tunis, 4476 feet; and in Tripoli, 3200 feet. The slopes on the north, west, and south are covered with vast forests of pine, oak, cork, white poplar, wild olive, &c. The valleys are well watered and capable of cultivation with great profit. The Atlas seems to be chiefly calcareous in its composition. The mineral wealth remains, however, almost wholly unexplored, though copper, iron, lead, antimony, &c. are stated to exist in abundance.

Atlas is that piece of the human vertebral column which articulates with the skull; in other words, it is the first cervical vertebra. It may be distinguished from the other six by its being without a body and spinous process, by its being a mere irregular bony ring, divided into two unequal parts by a constriction; this division in the recent subject is completed by a ligament, the segment in front being occupied by the tooth-like process of the second cervical vertebra or axis, and that behind, by the spinal marrow and its coverings. On either side the ring is very thick; each lateral mass is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra.

The atlas, with the occipital bone, forms the joint on which the head moves in bowing; and turns on the pivot of the second cervical vertebra, when we look from side to side.

Atlas, a kind of silk-satin manufactured in the East. The word is Arabic, and means 'smooth,' 'bare,' hence it has been applied to smooth silk cloth.

Atmolysis, a method of separating a mixture of gases by taking advantage of their different rates of passage through a porous septum. See DIFFUSION, GASES.

Atmometer, an instrument which can be used to determine the humidity of the atmosphere. Its action has not yet been fully investigated. It consists of a hollow ball of unglazed clay with a glass stem. The whole is filled with water and inverted in a dish of mercury. As the water, having passed into the pores, evaporates from the surface of the ball, the mercury rises in the stem. If much water-vapour be present in the atmosphere, condensation takes place in the pores, and the mercury falls in the tube.

Atmosphere (Gr. *atmos*, 'vapour,' *sphaira*, 'sphere') is the name applied to the gaseous envelope which surrounds the earth. The existence of an atmosphere is to us a matter of vital importance. We owe to its influence the possibility of animal and vegetable life, the modifying and retaining of solar heat, the transmission of sound, the gradual shading of day into night, the disintegration of rocks, and the occurrence of weather phenomena. In consequence of the action of gravity, the atmosphere assumes the form of a spheroidal stratum concentric with the earth, and presses heavily on its surface. It exhibits, in common with all fluid bodies, the usual characteristics of hydrostatic pressure, but its internal condition differs from that of a liquid inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water; hence, the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

That air possesses *weight*, is illustrated by the following simple experiment. If a hollow glass globe of 5 or 6 inches in diameter be weighed first when filled with air, and then after the air has been extracted from it by means of the air-pump, it will, when thus exhausted, weigh sensibly less than it did before, and the difference of the two results will represent the weight of the quantity of air which has been withdrawn. It has been determined by Biot and Arago that 100 cubic inches of dry air, when the barometer is at 30 inches, and the thermometer at 60° F., weigh 31.074 grains. The law of Archimedes (see ARCHIMEDES, PRINCIPLE OF), that a body immersed in a fluid loses a part of its weight equal to the weight of the volume of fluid displaced by it, finds its application in air as well as in water. If a glass globe filled with air and closed be suspended at the extremity of the beam of a delicate balance, and be kept in equilibrium by a brass weight at the other extremity, and if the whole be then placed under the receiver of an air-pump, and the air extracted, the equilibrium previously existing in air will be disturbed, and the larger body will become the heavier. The reason of this is, that when first weighed, they each lose as much of their own weight as that of the respective volumes of air displaced by them, and are therefore made buoyant, though in different degrees, the ball with the larger volume having the greater buoyancy. In a vacuum, they are deprived of this buoyancy, and the larger body, suffering the greater loss, becomes sensibly heavier than the other. In like manner, a balloon filled with heated air or hydrogen gas is lighter than the volume of air displaced by it. It is therefore forced upwards till it reaches a stratum

of such density that the weight of the volume of air there displaced by it equals the weight of the balloon itself. In this stratum it will remain poised, or move horizontally with the currents to which it may be exposed.

In endeavouring to determine the *form* of the atmospheric envelope, it is necessary to bear in mind that, according to the law of fluid-pressure, in order to produce a state of equilibrium at the level of the sea, the pressure of the atmosphere must be equal at that level over the whole of the earth's surface. Gravity acts with less force on the air at the equator than on that at the poles, in consequence of the spheroidal form of the earth. It has there, in addition, to contend with the centrifugal force, which entirely fails at the poles, and which has a tendency to lighten the air by acting contrary to that of gravity. Hence we infer that, in order to produce the same pressure at the level of the sea, the atmospheric height at the equator must be greater than that at the poles, and that the atmosphere must therefore possess the form of an oblate spheroid, whose oblateness is considerably greater than that of the earth itself. The greater heat at the tropical regions must also have the effect of increasing the oblateness.

The *height* of the atmosphere has not yet been determined. That it must have a certain limit, is evident from the consideration that there must be a point at which gravity on the one hand, and centrifugal force and the repulsive action of the particles on the other, are poised; and beyond this point, the latter forces outbalancing the former force, the aerial particles would be borne away from the earth. As, however, the law of the diminution of temperature, which materially affects the repulsive action, is unknown for the upper regions of the air, it is impossible to calculate the height of the atmosphere from the relations of these forces. From the observation of luminous meteors, however, it is inferred that in an extremely attenuated form it even reaches 500 miles.

The *pressure* of the atmosphere is one of its most important properties. Its effect is exhibited in the action of the ordinary water-pump. The piston is fitted air-tight in its cylinder; and on being drawn up, creates a vacuum. The water within the pump being thus freed from pressure, while that outside of it is exposed to the pressure of a column of air reaching to the surface of the atmosphere, is at once forced up by reason of the weight of air which it must rise to balance. The ascent of the water takes place till the piston has reached the height of nearly 34 feet, from which we conclude that a column of air is equal in weight to a column of water of the same horizontal section, and of the height of nearly 34 feet. As mercury is 13.6 times heavier than water, a mercurial column freed from atmospheric pressure at the one extremity, and subjected to it at the other, is 13.6 times less in height than the column of water, or about 30 inches. From the more convenient size of this column, mercury has been adopted as the standard for atmospheric pressure, and is employed in our ordinary Barometers (q.v.). A mercurial column of 30 inches in height, and 1 square inch in section, weighs 15 lb. (more accurately, 14.73), which gives us the equivalent weight of a column of atmospheric air of the same section. The word *atmosphere* is often employed to express this weight or pressure on a square inch of surface, so that when we speak, in Mechanics, of the pressure of steam on a boiler as amounting to three atmospheres, we mean a pressure of 45 lb. on the square inch. The pressure on a square inch being thus ascertained, we have merely to multiply it by the number of square inches on the earth's surface to obtain the total pressure or weight of the atmo-

sphere. It amounts to 11'67085 trillions of lbs., or about $\frac{1}{1000000}$ of the earth's mass. It must be observed that the height of the barometric column is not a constant quantity, as it varies irregularly from time to time, and more or less regularly with the latitude, the region, the season of the year, and the hour of the day. At London, its mean height is 29.88 inches; at Paris, 29.92 inches. The pressure of the atmosphere in the northern hemisphere increases as we recede from the equator, reaching a maximum at 30° N. lat., and generally decreasing from 30° to 65°, where it again begins to rise. The greater height, about 30°, is restricted to the oceans immediately to the westward of continents. As the heat of the earth's surface increases the rarity of the air above it, and causes the air at the top of the heated column to overflow, we would expect that, during the year, the barometer would stand at a minimum in summer, and a maximum in winter, and this state of things substantially holds good over the continents, or land surfaces of the globe. But over the oceans of the higher latitudes pressure falls to the annual minimum in winter, and rises to the maximum in the early summer. The variations of atmospheric temperature which occur, with their effects, result in a regular variation of the pressure of the atmosphere during the 24 hours of the day. There are two maxima—one about 10 A.M., the other 10 P.M.; and two minima—at 4 A.M. and 4 P.M. The pressure of the atmosphere exercises a most important influence on the organism of the human frame. A man of ordinary stature is exposed to a pressure of about 14 tons; but as the air permeates the whole body, and presses equally in all directions, no inconvenience is found to result from it. From experiments instituted by the brothers Weber in Germany, it has been ascertained that the heads of the thigh and arm bones are kept in their sockets by the pressure of the atmosphere; and in balloon ascents the aéronaut often suffers from bleeding at the nose, lips, and even eyes. These facts seem to indicate that the strength of the blood-vessels has been adjusted with reference to atmospheric pressure.

Chemical Composition of the Atmosphere.—Recent chemical researches give the following as the mean composition of 100 volumes and of 100 grains of dry air:

	Volumes.	Grains.
Nitrogen.....	79.02	76.84
Oxygen.....	20.94	23.10
Carbonic acid.....	0.04	0.06
	100.00	100.00

Besides the substances just named, other gaseous matters occur, but in quantities so small as not sensibly to increase the bulk of the atmosphere, such as ammonia and ammoniacal salts, carburetted and sulphuretted hydrogen, carbonic oxide, sulphurous and sulphuric acid, nitric acid, and perhaps iodine, the quantity and even the presence of which are affected by local and meteorological causes. Roughly speaking, then, dry air may be said to consist of 4 volumes of nitrogen and 1 of oxygen, with a slight admixture of carbonic acid, and a mere trace of several other substances. As, however, the air of the atmosphere is never found dry, we must add to the constituents already named watery vapour, the amount of which is constantly changing, according to locality, weather, wind, and temperature. It is stated that of 1000 grains of atmospheric air, the proportion due to aqueous vapour varies from a minimum of 4 to a maximum of 16 grains. By far the most active chemical constituent of the atmosphere is oxygen, to the agency of which are owing the existence of animal life, the maintenance of combustion, the rusting of

metals, and the occurrence of several other chemical phenomena too numerous to be detailed. A small portion of this oxygen occurs in the form of Ozone (q.v.), a modification which, according to recent chemical discoveries, plays an important part in the chemistry of the atmosphere. The nitrogen which forms the bulk of the atmosphere possesses few chemical properties of importance, but performs the important part of diluting the oxygen, which, if it occurred alone, would act with too great intensity. The presence of carbonic acid in the air is shown by the production of the white carbonate of lime in lime-water freely exposed to its influence. Carbonic acid is produced in all processes where carbonaceous matter unites itself with the oxygen of the air, such as in animal respiration, in combustion, in fermentation, in putrefaction, and similar processes. The green leaves of plants, on the other hand, possess, in presence of sunshine, the power of decomposing carbonic acid into its elements, absorbing the carbon for their own tissues, and restoring the oxygen to the atmosphere in its original purity. Between the processes above mentioned, on the one hand, and the action of plants on the other, the quantity of carbonic acid in the air is kept nearly constant. From the table it will be seen that 10,000 volumes of atmospheric air contain 4 volumes of carbonic acid. If it occurred in a much larger proportion, being poisonous, it would become dangerous to animal life; and if it occurred in a much less proportion, the vegetable world would lack its requisite nourishment. The other substances, of which a trace is always or only sometimes found in atmospheric air, are difficult to detect in the air itself, but are generally found dissolved in rain-water, more especially in that which has fallen immediately after a long drought. Of these, by far the most important and widely diffused are ammonia and ammoniacal salts, which are of essential importance to the vegetable economy, because, dissolved in the rain, they furnish plants with the nitrogen required by them for the production of their flowers and fruit. Nitric acid is detected in the air after thunderstorms, sulphuretted hydrogen in the tainted air of sewers and such-like places, and sulphurous and sulphuric acid only in the neighbourhood of chemical or smelting works. A considerable quantity of carbonic oxide and carburetted hydrogen escapes unconsumed from our furnaces; and although the latter gas is in addition given off to the air in marshy and bituminous districts, the two occur in almost inappreciable quantity in the atmosphere.

In addition to its gaseous constituents, the atmosphere contains solid substances in a state of exceedingly fine division, the presence of which is revealed in the sunbeam. Many of these minute particles, being the seeds or germs of plants and animals, must exert an important influence on the organic substances on which they may finally settle, inducing in many of them the conditions of disease or putrefaction. The results of the Krakatoa eruption of August 1883, and recent deep-sea dredgings in the Pacific, reveal that a large amount of meteoric and volcanic dust is suspended in the atmosphere; and if to this be added the fine dust particles, which Mr Aitken has shown to be essential as nuclei in the formation of fog and cloud, there is an amount of solid matter suspended in the air not hitherto suspected. See DUST, GERM THEORY.

When the composite nature of the atmosphere was first discovered, it was supposed to be a chemical combination of nitrogen and oxygen, but further inquiries have rendered this opinion highly improbable. When any two bodies unite with each other chemically, the substance which results from

their combination invariably possesses properties which the original constituents did not possess. Now the atmospheric union of oxygen and nitrogen is distinguished by no properties which may not be attributed individually to these gases. We have, then, in this respect, no indication that the atmospheric combination of oxygen and nitrogen is a chemical one. Again, when any composite gas is dissolved in water, the proportion of the ingredients dissolved in it is exactly the same as that in which they occur in the compound itself; but this is not the case with air dissolved in water, which is found to be richer in oxygen than atmospheric air. Now, as oxygen dissolves more readily in water than nitrogen, it is manifest that this larger proportion of oxygen arises from both gases acting independently of each other in respect to the water, a condition that would be impossible if they were in chemical union. From these and other corroborative facts, the atmosphere is considered to be simply a mechanical combination of the gases contained in it. This, however, does not prevent the atmosphere from having a uniform composition, as might at first sight be supposed; for when gases are mixed with each other, they may practically be regarded as intermingling thoroughly throughout the whole space occupied by them. Local causes may temporarily affect the relative proportion of the atmospheric ingredients, but the changes are so minute as to require the most delicate analysis to detect them.

Atmospheric Electricity. See ELECTRICITY (ATMOSPHERIC).

Atmospheric Engine. See AIR-ENGINE.

Atmospheric Railway. See PNEUMATIC RAILWAY.

Atoll (a Maldivian word), a form of Coral Island (q.v.), consisting of a more or less interrupted ring of coral rock, inclosing a central lagoon. As examples may be mentioned Whitsunday Island, Keeling Atoll, Bow Atoll, Peros Banhos Atoll. See CORAL ISLANDS, POLYNESIA.

Atom (Gr. *atomos*, 'that which cannot be cut') is a term properly belonging to the science of that class of physicists who deny the infinite divisibility of matter. It has a secondary, but unjustifiable, use among chemists.

Much of the very old speculation as to the ultimate constitution of matter has been preserved to us in the remarkable poem of Lucretius (q.v.). He follows the teaching of Democritus and Leucippus, basing his argument for the existence of atoms mainly upon the (supposed) result of observation that 'reproduction is slower than decay,' and therefore that there would now, after infinite ages of decay, be no aggregate left unless there were a limit to breakage. He ridicules the opposite theory, propounded by Anaxagoras (that of *Homöomeria*), which asserts that, however far a body may be divided, the parts are still similar to the whole, and therefore capable of yet further division. Epicurus (q.v.), and in modern times Gassendi (q.v.), are also notable representatives of the 'Atomic School.'

Modern science has made no advance towards the decision of this question. Even the Vortex-atom (q.v.) requires to be made up of a species of matter, and the postulates of that theory do not as yet require any speculation as to whether it is infinitely divisible or not. But, if the question of the existence of atoms (in the true sense of the word) has made no progress, that of the finite heterogeneity of all kinds of matter has recently advanced very fast.

Chemical and physical facts, of the most varied and independent character, unite in giving us the information that, even in such apparently texture-

less bodies as glass and water, after a certain finite amount of division, a stage is reached at which any further division breaks the body into fragments which are not necessarily similar to one another, nor to the original substance. For the chemical arguments on this subject, see ATOMIC THEORY, CHEMISTRY, and MOLECULE; for the physical ones, see GASES (*Kinetic Theory of*), and MATTER. In these articles the reader will find the latest data as to the probable size of the 'grain' in different kinds of matter. Further than this, no speculation of any value has yet been ventured upon.

Atomic Theory. What is known as the atomic theory is a theory as to the nature of the ultimate particles of matter, which, supported as it is by both chemical and physical evidence, has been of great service in the explanation of chemical facts, as well as in the progress of scientific chemistry.

Theoretical speculations as to the nature of the constitution of matter date from the earliest times of philosophy, but the gradual development of the atomic theory into its present form is owing to the accumulation of chemical and physical facts during a period of about a century. Matter has long been regarded as not being continuous, but as possessing a *grained* structure—i.e. as being made up of extremely minute particles. These particles, or groups of such particles, are supposed to be arranged in any substance at a certain average distance from one another, such average distance depending not only upon the physical state of the substance—i.e. whether solid, liquid, or gas—but also upon the temperature and pressure.

The honour of having first formulated an atomic theory based upon experimental evidence, obtained from his own investigations and from those of his predecessors and contemporaries, falls to Dalton. Prior to Dalton's first publication, at the beginning of this century, of his contributions to the subject, a good deal of investigation had been made leading up to the establishment of a rational atomic theory, although it had not been fully recognised as such at the time. It was known that chemical compounds contained their elements in certain definite and fixed proportions. Moreover, by finding the quantities of various acids required to neutralise a given quantity of a particular base, and of various bases required to neutralise a given quantity of a particular acid, it had been ascertained that numbers could be assigned to each acid and base which represented quantities which were chemically equivalent. Thus a quantity of an acid, A, combined with a quantity of a base, B, to form a neutral salt, AB; the same quantity of A combined with a quantity of another base, C, to form a neutral salt, AC; and the same quantity of B combined with another acid, D, to form a neutral salt, DB. The important point which had been established was, that the quantity of acid D in DB, and that of base C in AC, combined to form another neutral salt, DC. It was also known that the quantities of various metals dissolved by the same weight of an acid were capable of uniting with the same weights of oxygen. Further, it was known that several metals and other elements formed more than one compound with oxygen, the proportion of the latter being different in each. Dalton showed that when elements united with each other in two different proportions, these proportions were related to each other in a very simple way. Thus, he showed that a given weight of carbon united with a certain proportion of oxygen to form carbonic oxide, and with just twice as much to form carbonic acid; also that in olefiant gas and in marsh-gas the relation of the proportion of hydrogen for a given weight of carbon was as one

is to two. Other examples were also known to him, notably in the case of compounds of oxygen and nitrogen, which showed similar simple relations. This discovery of Dalton's was what has been subsequently known as the *law of multiple proportions*, and, to explain it, Dalton reverted to the atomic hypothesis, which assumed that matter consists of atoms of different weights, those of the same element being all of the same weight.

Dalton regarded carbonic oxide as a compound of 1 atom of carbon and 1 of oxygen, and carbonic acid as a compound of 1 atom of carbon and 2 of oxygen; olefiant gas as a compound of 1 atom of carbon and 1 of hydrogen, and marsh-gas as a compound of 1 atom of carbon and 2 of hydrogen. He further assigned atomic weights or relative weights of the atoms, based upon the results of his own experiments, to each of the elements he had examined, assuming the atomic weight of hydrogen to be unity, as hydrogen combined with other elements in smaller proportion by weight than any other element. Although Dalton's atomic weights were far from accurate, yet his theory was sound that the observed law of multiple proportions could be satisfactorily explained by the atomic hypothesis.

Dalton further introduced a system of chemical notation, in which the atoms were represented by symbols.

Quickly following on Dalton's discoveries, was the discovery by Gay-Lussac of the simple relations of the volumes of gases which combine to form new compounds, and of the volume of the new gas produced. Thus Gay-Lussac proved that 2 volumes of hydrogen combined with 1 volume of oxygen to form 2 volumes of water vapour (all measured at the same pressure and temperature—these being of course such that the whole of the water formed was in the gaseous state); that 1 volume of hydrogen combined with 1 volume of chlorine to form 2 volumes of hydrochloric acid gas; and that similar simple relations existed in other cases. Gay-Lussac also noted that the numbers representing the atomic weights of elementary gases were simply related to the specific gravities of these gases. Indeed this follows directly from a consideration of his law of the simple relation of volumes, for, if 1 volume of hydrogen combines with 1 of chlorine to form hydrochloric acid, and if the gases combine atom for atom, which seems to be the simplest assumption, it is obvious that the weights of hydrogen and of chlorine in a given volume, at the same pressure and temperature, must be proportional to the atomic weights of these gases. In short, the two sets of numbers are identical if hydrogen be assumed as unity for both atomic weights and specific gravities. But further, it is also manifest that the specific gravity of the resulting gas must bear a simple relation to the specific gravities of its component gases.

Up to this period, although attempts had been made, notably by Dalton and Berzelius, to affix atomic weights to the elements, it had not been possible to do so with much certainty. An important step, however, towards definitely fixing the atomic weights of many elements was made by the experiments and observations of Dulong and Petit. These investigators called attention to the relation between the specific heats of the elements and their atomic weights. Generalising from their experiments on a number of the elements, Dulong and Petit concluded that what are now known as the *atomic heats* of all elements (that is their specific heats multiplied by their atomic weights) were approximately identical. This conclusion might also be stated otherwise—viz. that the capacity for heat of elementary atoms is identical. Some notable exceptions to

this generalisation were subsequently found, but the *law*, as it is called, of Dulong and Petit, is substantially correct. To take some examples, the specific heat of potassium multiplied by its atomic weight (166×39), gives as product 6.5. In the case of iron, the number is 6.3 (112×56), and of mercury 6.4 (103.19×200). These numbers are very nearly constant, but all are not quite so close. Lothar Meyer states (*Moderne Theorien der Chemie*, 4th ed. p. 93) that although most atomic heats lie between 6.1 and 6.5, some are as low as 5.2 and others as high as 6.9. The fact that the atomic weights used by Dulong and Petit were different from those now commonly adopted, does not alter the general conclusions to be drawn from their observations. The constant number representing the atomic heat was, of course, different from that given above. It has not been possible to determine directly the atomic heats of all the elements, but the atomic heats of a good many have been estimated by indirect means from the molecular heats (that is molecular weights \times specific heats) of their compounds, for it has been found to be at least approximately true that the molecular heat of a compound substance is equal to the sum of the atomic heats of the atoms which it contains. In other words, the product of molecular weight \times specific heat, divided by the number of atoms in the molecule, gives a constant number.

The variations in atomic heats of various elements are, it will be noticed, considerable, but still it is sufficiently clear that an atomic heat determination is a most valuable assistance in fixing which of two or three numbers, each of which would sufficiently express the chemical relations of an element, should be adopted to represent its atomic weight. Other considerations have led in some cases to the fixing of a certain atomic weight for an element, but with the exception of what is known as Avogadro's Law, these need not be particularised here. Avogadro's Law is of the first importance, although its bearing was not recognised until many years after its promulgation, which precedes historically that of the law of Dulong and Petit.

Avogadro distinguished between elementary atoms, or the smallest indivisible particles of an element, and molecules, or the smallest portion of a substance, possessing all the properties of the substance. His molecules are hence groups of 2 or more atoms, each group being capable of a separate existence. Avogadro's Law is based upon some considerations of the physical properties of gases, which he held received their simplest explanation by the assumption that a given volume of any gas, whether elementary or compound, contains the same number of molecules as the same volume of any other gas when measured at the same pressure and temperature. This law is in complete accord with the dynamical theory of gases. See article GAS.

If now Avogadro's Law be true, the relative densities of gases must represent their relative molecular weights whether the gases be elementary or compound. Hence we are led to suppose that the molecules of some elementary gases, as of compound gases, consist of 2 or more atoms. Thus 2 volumes of hydrogen unite with 1 of oxygen to form 2 volumes of water vapour. Now, if 2 volumes of hydrogen contain twice as many molecules as 1 volume of oxygen, and the resultant 2 volumes of water vapour contain as many molecules as the original 2 volumes of hydrogen, it is obvious that each molecule of oxygen must be split into 2, and that the molecule of oxygen must consist of at least 2 atoms. Again, 1 volume of hydrogen unites with 1 volume of

It will be noticed that only in those cases where an even multiple of 35.4 parts of chlorine exists, is the place of the latter taken by oxygen alone. In

Such is an example of the nature of the very varied chemical evidence for the fixing of a particular atomic weight. Below is a list of the elements at present known with certainty, and of their atomic weights as fixed by the various kinds of evidence obtained by very numerous, and in many cases, varied experiments. The old atomic weights are given in the last column for comparison. In most cases these are just half the new atomic weights (see the list below). The new numbers are now all but universally employed by chemists.

It has been stated in the foregoing that 1 atom of oxygen is generally regarded as combining with 2 of hydrogen to form water, and that 1 atom of chlorine combines with 1 of hydrogen to form hydrochloric acid. These are not the only variations in the number of hydrogen atoms which unite with 1 atom of another element to form a compound. Thus in ammonia we have 1 atom of nitrogen united with 3 of hydrogen; in marsh-gas, 1 of carbon united with 4 of hydrogen. Similarly, in many metallic chlorides the number of atoms of chlorine for 1 of metal varies, as for instance, in KCl , CaCl_2 , BiCl_3 , SnCl_4 , &c. Again, the oxides corresponding to these chlorides are respectively K_2O , CaO , Bi_2O_3 , SnO_2 , &c.; while we know other compounds in which 1 atom of potassium exists in combination with 1 of bromine or iodine; 1 atom of calcium with 1 of sulphur or 2 of fluorine; 1 atom of antimony with 3 of hydrogen; or 2 of antimony with 3 of sulphur, and so forth. From these examples it will be clear that the atoms of the elements possess different *exchange values* in replacing one another in chemical compounds. This exchange value of an element is called its *valency*. 1 atom of chlorine combines with 1 of hydrogen or 1 of potassium, and these three elements are said to be *monovalent*. Calcium, oxygen, and sulphur are *divalent*; nitrogen (in ammonia at least), antimony, and bismuth, *trivalent*; carbon and tin,

tetravalent, &c. Some elements appear to have more than 1 valency, as for instance, phosphorus, which forms 2 chlorine compounds, PCl_3 and PCl_5 . Much controversy has taken place as to fixing the valency of such elements, some chemists contending that valency is invariable, and that where we find in some compounds an apparent valency less than the highest known, it is to be explained by supposing a part of the combining power to remain unsatisfied. It seems simplest to assume that the valency of an element may differ in different sets of compounds. The amount of importance attached to the valency of an element, and to the question as to whether or not the valency of an element is variable, is not now so great as it was formerly.

What is known as the *equivalent* of an element is that proportion of an element which is capable of taking the place of 1 atom of a monovalent element. Thus, 39 parts of potassium combine with 35.4 of chlorine to form potassium chloride. The equivalent quantity of calcium is not 40 parts (for that quantity of calcium combines with 35.4×2 parts of chlorine) but $\frac{40}{2} = 20$ parts. 20 is therefore the equivalent weight of calcium. Faraday has shown that those quantities of various elements are chemically equivalent which are separated from various electrolytes by the passage through them of the same quantity of electricity. See ELECTRICITY, GALVANISM.

When the elements are arranged in progressive order of their atomic weights, a certain regularity of succession of chemically analogous elements is observed. Attention was drawn to this by Newlands, and the matter was more fully developed by Lothar Meyer and especially by Mendeleëff, who formulated the *Periodic Law* which states that the properties of an element are a function of its atomic weight. The regularity of the recurrence of the cycles or periods is so striking that the appearance of gaps in the list led to the prediction not only of the existence of numerous undiscovered elements, but of the probable properties these elements would be found to possess when discovered. These predictions have been very fully verified in the case of two or three recently discovered elements, notably gallium and germanium.

A list of the elements arranged according to the periodic system is given below:

Groups	I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Series	H 1							
1	Li 7	Be 9	B 11	C 12	N 14	O 16	F 19	
2	Na 23	Mg 24	Al 27	Si 28	P 31	S 32	Cl 35.4	
3	K 39	Ca 40	Sc 44	Ti 48	V 51	Cr 52	Mn 55	Fe 56; Co 58.6; Ni 58.6.
4	Cu 63	Zn 65	Ga 70	Ge 72.3	As 75	Se 79	Br 80	
5	Rb 85	Sr 87.5	Y 89	Zr 90	Nb 94	Mo 96	Ru 103.5; Rh 104; Pd 106.
6	Ag 108	Cd 112	In 113.4	Sn 118	Sb 120	Te 125	I 126.5	
7	Cs 133	Ba 137	La 138	Ce 140	Di 142	Sa 150	
8	Er 166	
9	Yb 173	Ta 182	W 183.6	Os 191; Ir 192.5; Pt 194.4.
10	Au 196.5	Hg 200	Tl 204	Pb 206.4	Bi 208	
11	Th 232	U 240	

In this table each horizontal line forms a period or cycle of the elements, and the various groups arranged in columns contain elements which ex-

hibit chemical analogies and similarities which are often very striking. The elements placed at the left of the columns possess greater resemblances to

each other than to those placed at the right, and *vice versa*. Those elements included under Group VIII. are exceptional. In each series where they occur we find a set of three elements which Mendeleëff calls *transition elements*, as they occur between the end of one and the beginning of the next *long period* or term of two series. Numerous gaps still exist in the table, indicating the places which, doubtless, elements which are still to be discovered will hereafter occupy.

A marked periodicity is noticed in the *atomic volumes* of the elements (that is, in the quotients of the specific gravities of the solids divided by their atomic weights) in each of Mendeleëff's series. This subject, however, cannot be pursued here, as its discussion would lead too far. For further information concerning it and the periodic law generally, the reader is referred to some of the larger modern text-books of chemistry. See also the article **CHEMISTRY** in this work.

Atomic Weights. See **ATOMIC THEORY**.

Atonement. Sin violates the ground of union which the personal creature has by nature with the holy God. The act of sin is one of separation; the act begets the state of sin, the state confirms and repeats the act. The doctrine of the atonement treats of the mediation necessary for restoring the union between God and man, which has been lost by sin. The atonement, therefore, must ever be the fundamental doctrine in every religion of sinful creatures. In the Christian religion, it manifestly occupies this central position; for the Christian doctrine of the atonement is but the explanation of its great historic fact—the embodiment in one person of the divine and human natures in perfect agreement. In the person of Christ, God and man are atoned or made at one: he is their Atonement.

So fundamental is the doctrine of the atonement in the Christian religion, that all churches may be said to be orthodox on this point. The Church of Rome, the Greek Church, the various Protestant churches all agree in resting the sinner's hope of salvation on the mediatorial work or atonement of Jesus Christ. Nevertheless, from the very beginning of speculative Christian theology, there have been within the several churches various ways of conceiving and explaining the nature and mode of operation of this mediatorial work. What follows is a brief sketch of the historical development of these speculations.

Christianity differs from heathenism in the clear perception which it has of the antagonism sin has introduced between God and man. Heathenism but vaguely conceives of this variance, and consequently has but an ill-defined notion of the atonement required. The abject subjection of man to nature prevents his rising into that sphere of conscious freedom which makes sin sinful, and demands an atonement with one who is Lord both of nature and man.

In Judaism, man stands above nature, in conscious relation to a personal God, whose written law exhibits the requirements of his relationship with man—requirements which are never met, and which only make him fearfully conscious of the ever-widening breach between himself and his God. Thus the law awakened the sense of guilt, and the desire for an atonement; a desire it could never satisfy. The never-ceasing demands of these ever-unfulfilled requirements were constantly acknowledged by its whole sacrificial *cultus*, which symbolically expressed the hidden ground of Jewish hope, and prophetically pointed to its future manifestation. The Holy Scriptures in the Old Testament exhibit the making of an atonement by

vicarious sacrifice, but the idea of the suffering and vicarious Messiah, declared in the writings of the prophets, and not entirely hidden from the more thoughtful and devout contemporaries of Jesus, was one which was foreign to the Messianic faith of the great body of the people.

In the New Testament, Christ is exhibited as one sent from God for the salvation of the world; and as the condition, on the part of man, of his obtaining this salvation, we read of the requirement of repentance, faith, and reformation; whilst, on the part of God, as conditioning and mediating his forgiveness of sins, we have exhibited the life of Christ upon earth, but more especially his death, as a ransom for our sins, by which we are redeemed from the bondage of sin, and obtain forgiveness, and eternal life and peace with God. Christ is therefore the Mediator between God and man, having made peace through the blood of his cross; the propitiation for our sins; and our high-priest who offers himself a sacrifice to reconcile us with God. Moreover, we are also taught that God has in Christ reconciled the world with himself.

In accordance with this full and explicit teaching of Holy Scripture, we find that the sufferings and death of Christ were ever regarded as of primary and essential importance in his work of redemption; but notwithstanding this, we look in vain throughout the early centuries of the Christian Church for anything like a systematic development of the doctrine of the atonement. The germs of the doctrine existed, but without any logical connection or clearness. The early church fathers dwell with a sort of inspired devotion upon those facts of the gospel which represent Christ as the sacrifice for our sins, as the ransom paid for our redemption, as our deliverer from the power of Satan, as the restorer to mankind of whatever was lost by the fall of Adam; but they seldom attempt to show *how* these results connect themselves with the sufferings and death of Christ; neither do they show in what manner the atonement has objectively been made, nor how it is brought to the experience of its individual subjects. Throughout the whole earlier age of the church down to the time of Anselm, the belief was generally prevalent that Christ was offered by God, as a ransom for his people, to Satan, who held them by the power of conquest; this was specially emphasised by Origen and Irenæus, but a view similar to that of Anselm was also maintained by many, though with vagueness and inconsistency. Baur maintains that the former mode of considering the death of Christ was transplanted from the gnostics to the church by simply converting the person of the demiurge into that of the devil. Gregory of Nyssa explained that the devil consented to receive Jesus as a ransom, because he regarded him as more than an equivalent for all those under his power; but that, notwithstanding his subtlety, he was outwitted, for, owing to the humiliation in which Christ was veiled, he did not recognise him as the Son of God, and consequently was himself deceived. But having consented to receive him as a ransom for mankind, he was righteously deprived of his dominion over man, whilst he could not retain Jesus when he discovered him to be the Holy One of God. St Augustine modified the doctrine essentially by pointing out that the devil, who had overstepped his power, was conquered in the struggle. He had overstepped his power in this, that he thought he could treat the sinless Jesus as a slave, like the other sons of Adam, which last, in fact, belonged to him as prisoners. Now he lost his right to the latter so far as they belong to Christ.

The idea of a penalty endured on the part of

God gained the predominance after its advocacy by Athanasius. He argued that as God had threatened to punish transgressors with death, he could but execute his threat. But then it was not becoming the character of God to allow his purpose in the creation of man to be frustrated by an imposition practised upon him by the devil. The only expedient, therefore, which remained for man's deliverance from death was the incarnation and sacrifice of the Logos in his stead, by which the justice and veracity of God would be maintained, man delivered, the law fulfilled, and the power of the devil broken.

But the doctrine of the atonement was not presented in its final form until the acute and subtle genius of Anselm reduced the more or less confused conceptions of the early fathers to strict dogmatic definitions, and for the first time adjusted the apparent contradiction between divine love on the one hand, and divine justice and holiness on the other. To his clear intellect is due that statement of the doctrine of vicarious *satisfaction*, which, under various modifications, has ever since continued to be held as the orthodox doctrine of the church. The infinite guilt which man had contracted, by the dishonour of his sin against the infinitely great God, could be atoned for by no mere creature; only the God-man Christ Jesus could render to God the infinite satisfaction required. God only can satisfy himself. The human nature of Christ enables him to incur, the infinity of his divine nature to pay, this debt. But it was incumbent upon Christ as a man to order his life according to the law of God; the obedience of his life, therefore, was not able to render satisfaction for our guilt. But although he was under obligation to live in obedience to the law, as the Holy One he was under no obligation to die. Seeing, then, that he nevertheless voluntarily surrendered his infinitely precious life to the honour of God, a recompense from God became his due, and his recompense consists in the forgiveness of the sins of his brethren. In this form of the doctrine we are taught the necessity of an active vicarious satisfaction; but Anselm nowhere teaches the passive satisfaction, he nowhere says that Christ endured the punishment of men. Nor do we find in his writings the development of the subjective side of the doctrine—namely, how the satisfaction rendered to God mediates the atonement in the experience of the believer. According to Anselm, the satisfaction rendered by Christ was greater than the guilt for which he atoned; and it needed to be greater, for the payment of the debt due to God gave men no claim to the favour of God. Abelard attached principal importance to the moral aspect of the doctrine, and declared the love of Christ the redeeming principle, inasmuch as it calls forth love on our part. Thomas Aquinas and his followers maintained Augustine's opinion of the infinite value of the blood of Christ rendering it more than sufficient; while the Scotists maintained that it was sufficient only because God was pleased to regard it as sufficient.

Protestants and Roman Catholics alike accept the doctrine of the atonement as given in Anselm's *Satisfaction* theory, in ascribing to the sufferings or merits of Christ an infinite objective value, but the former give the preference to that aspect of this theory presented by Thomas Aquinas; the latter, to that of Duns Scotus. The Protestant theologians, however, extended the idea of vicarious suffering, so as to make it include the divine curse, an opinion against which Bellarmine protested as 'a new unheard-of heresy,' while, on the other hand, they insisted on the active obedience of Christ, together with the passive, referring the former to the complete obedience which he yielded to the law.

Both opinions were intimately connected with the Protestant dogma of justification. With the Roman Catholic theologians, satisfaction is made by the death of Jesus only for guilt contracted before baptism, and only the eternal punishment due to mortal sins committed after baptism is remitted; so that Christians have themselves to make satisfaction for venial sins by temporal punishments. They also asserted that the merits of Christ were supererogatory, while Protestants thought they were equivalent to the penalties to be inflicted upon men. And lastly, according to Roman Catholics, Christ by his sufferings obtained merit for himself. Among the Protestants themselves, the Reformed Church approximated more nearly to the Scotist *acceptilatio* than did the Lutherans. The following is an outline of the Lutheran doctrine, as laid down in the *Concordienformel*: It is alone by faith we can receive the blessings presented to us in the gospel by the Holy Ghost. Faith justifies, because it appropriates the merit of Christ. Therefore, the righteousness which is imputed to the believer, simply by the grace of God, is the obedience, the suffering, and the resurrection of Christ, by which he has satisfied the claims of the law, and atoned for our sins. For as Christ is not merely man, but God and man in one person, he was, as Lord of the law, no more subject to it than he was subject to suffering and death. For this reason, his twofold obedience—that which he rendered, on the one hand, by his suffering and death; and, on the other, by his righteous fulfilment of the law on our behalf—is imputed to us, and God acquits us of our sins, and regards us as just, in view of his complete obedience in what he did and suffered. This obedience embraces the entire existence of Christ upon earth, and is so complete that it fully covers the disobedience of men, so that it is not reckoned against them for condemnation.

According to Calvin, if it is asked how Christ has reconciled us with God, and purchased a righteousness which made him favourable to us, it may be answered generally, that he accomplished this by the whole course of his obedience. But although the life of Christ is to be regarded as paying the price necessary for our deliverance, the Scriptures ascribe our redemption especially to his death. Calvin attached great importance to the particular mode of his death—any other mode of death would not have rendered the same satisfaction to God. He, however, says little or nothing about Christ's fulfilling the law for us, but dwells upon his delivering us from its curse. He does not, therefore, exhibit his active obedience separated, as an essential part of his satisfaction for sin, from his passive obedience. The importance attached to the obedience of his life arises from its natural and necessary connection with his suffering and death. And the great importance attached to his death is drawn rather from the view of its subjective necessity, than from the idea of the divine righteousness—namely, that without such a death there would have been no sufficient ground for the subjective realisation of deliverance from sin and guilt. Calvin's view differs from that of the Lutheran *Concordienformel* in that he does not regard the relationship of God to man so much through the negative notion of a Redeemer from guilt and punishment, but looks upon Christ as the highest Mediator, through whom the nature of God is communicated to man.

'Modern Calvinism' represents the atonement as that satisfaction for sin which was rendered to God, in his public character as moral governor of the world, by the perfect obedience unto death of our Lord Jesus Christ. The nature of this satisfaction was a moral, not a pecuniary satisfaction.

It preserves to the moral government of God its authority, whilst its tendency is to secure the forgiveness of sin. The value of the sufferings of Christ consists in their tendency to uphold the divine moral government unimpaired, whilst pardon is extended to those who have violated it. There was a moral necessity for Christ's sufferings and death—obstacles to the bestowment of pardon had to be removed—the influence of the Holy Spirit had to be secured. The whole contents of Christ's earthly existence, embracing both his active and passive obedience, must be regarded as contributing to the atonement which he made. As to the 'extent' of the atonement, there is a broad distinction to be made between the *sufficiency* of the atonement and its *efficiency*. It may be true that Jehovah did not intend to exercise that influence of the Holy Spirit upon all, which is necessary to secure the salvation of any one; but as the atonement was to become the basis of moral government, it was necessary that it should be one of infinite worth, and so in itself adequate to the salvation of all. The Universalists (q.v.) hold both the sufficiency and ultimate efficiency of this great event.

The foregoing represents the modified view of the doctrine as advocated by Dr Payne, and as held, in all essential respects, by such men as Pye Smith, Wardlaw, and many others. This view in its earlier form, and as found in the writings of Owen and Edwards, maintains that the atonement was made only for the elect; and that its necessity with respect to them arose out of the eternal justice of God, which required that every individual should receive his due desert; and, consequently, that the sufferings of Christ were the endurance of punishment equivalent in amount of suffering, if not identical in nature—as Owen maintains—with that to which the elect were exposed; and, moreover, that the meritorious obedience of Christ in fulfilling the law, imputes a righteousness to those for whom the atonement secures salvation, which gives them a claim to the reward of righteousness.

The teaching of Socinus is a re-statement of the *Moral Influence* theory first distinctly taught by Abelard. It represents man as attaining to oneness with himself and with God by his own moral energy. It rejects that idea of the righteousness of God which makes it impossible for him to forgive sin without a satisfaction, as imposing finite limitations upon the divine Being; disapproves the doctrine of satisfaction, on the ground that satisfaction for sin and forgiveness of sin are incompatible with each other; and objects that sin and punishment are of so personal a nature as not to allow of their being transferred. The doctrine it sought to establish was that man is reconciled to God by repentance and reformation. Only from an act of man changing his disposition, and not from an act of God changing his relation to man, follows his reconciliation with God. God is in himself ever the same towards man—reconciled from all eternity; man alone has to assume a new relation; as soon as he does this, he is immediately reconciled; by this act of his will, he is at one with God. In this purely subjective theory, repentance occupies the place of faith in the orthodox doctrine, and faith becomes identical with obedience. The sufferings of Christ were necessary in order that he might become our example, and be better fitted to render us help; that we might have a pledge and guarantee of the divine forgiveness; and as conditioning his resurrection and ascension to glory.

The Arminians endeavoured to take an intermediate position between the theory of Socinus and the satisfaction theory of Anselm. They asserted that the design of Christ was to render a sacrificial

oblation in behalf of all men indiscriminately, by which 'sufficient grace' is meritoriously secured for each, and their sins rendered remissible upon condition of faith. They maintained that the doctrine that Christ satisfies in our behalf the preceptive demands of the law by his active obedience, as well as the penal demands by his passive obedience, leads to Antinomianism.

Grotius drew a subtle distinction between *satisfactio* and *solutio*, and taught that God, by inflicting death on Christ, had given in an arbitrary way an example of punishment. His atonement theory is known as the *Governmental* theory. According to it God's justice is not vindicatory, but may be referred to a general governmental rectitude based on a benevolent regard for the well-being of the subjects of his moral government. Law is a product of the divine will, and therefore relaxable. God's sovereign prerogative includes the right of pardon. God so conditions the pardon of human sinners, by selecting such an example of suffering that man may not think he can sin with impunity. Christ's sufferings, then, were not punishment, but an example of a determination to punish hereafter. They were not to satisfy divine justice, but to impress the mind of the moral universe with a sin-detering motive. This view is substantially the same as that held by the younger Edwards in America. After Grotius, Limborch emphasised the idea of a sacrifice, as set forth in the Old Testament, which the theologians previous to Anselm had generally adopted. This theory was introduced into the Arminian works on theology, and approved by the Socinians of the next period. The Quakers admitted that redemption has once been made by the death of Christ, but connected with it the idea of a second redemption realised internally. This second reconciliation they regarded as the essential redeeming principle.

According to what is often called the *Mystical* theory, the reconciliation effected by Christ was brought about by the mysterious union of God and man, accomplished by the incarnation, rather than by his sacrificial death. This view was not confined to the Platonising fathers or the disciples of Scotus Erigena, but was held by Osiander and Schwenkfeld at the Reformation, and by the school of Schleiermacher, the most spiritual among modern theologians. The last connected the doctrine of the vicarious sufferings and perfect obedience of Christ with his sinlessness and the doctrine of his priestly office, but separated the substitution and the satisfaction so as to represent Christ's sufferings as only vicarious, but not as making satisfaction; and his obedience as making satisfaction, but not as vicarious. The redeeming and atoning principle is not the single fact that Christ died, but a vital union with him. By means of this we appropriate to ourselves Christ's righteousness (his obedience unto death); this appropriation, however, is not to be confounded with the mere external theory of vicarious satisfaction. Christ's passive obedience is merely the crown of his active obedience.

The following are the statements of three modern representative English theologians: (1) J. J. Tayler, as representing the view of modern Unitarianism, which has followed naturally from the 'moral influence' theory of Socinus and earlier of Abelard; (2) Dr J. M'Leod Campbell, whose 'sympathy theory' was a spiritual outgrowth from Calvinism; (3) F. D. Maurice, the representative of the modern 'Broad Church' School, which approximates to the 'moral influence' theory in its attitude to the atonement question.

(1) Dr Tayler says: There is *one* mediator between God and men, the man Christ Jesus. This can only refer to univalued pre-eminence, not to

exclusive function. For all higher minds do, in fact, mediate between their less gifted fellow-creatures and the great realities of the invisible world. This 'one' is a human mediator, 'the man Christ Jesus'—not a being from another sphere, an angel or a God—but a brother from the bosom of our own human family. 'He gave himself a ransom for all' who embrace his offers and will hearken to his voice. He brings from God a general summons to repent; and with that he conveys, through faith, a spiritual power to shake off the bondage of sin, and put on the freedom of a new heart and a new life. He is a deliverer from the power of sin and the fear of death. This is the end of His mediation. This is the redemption of which he paid the price. His death, cheerfully met in the inevitable sequence of faithful duty, was only one among many links in the chain of instrumentalities by which that deliverance was effected. It was a proof, such as could be given in no other way, of trust in God and immortality, of fidelity to duty, and of love for mankind. In those who earnestly contemplated it, and saw all that it implied, it awoke a tender response of gratitude and confidence, which softened the obdurate heart, and opened it to serious impressions and the quickening influences of a religious spirit.

(2) Dr John M'Leod Campbell says: The work of the Son of God who came to do and did the will of his Father must, in view of the deliverance which he wrought, be regarded as twofold: first, as dealing with man on behalf of God, and second, as dealing with God on behalf of man. In dealing with man on behalf of God, Christ revealed to us the Father in his relation to a sinful world, showed us what our sins were to God, vindicated in the world the Father's name, and witnessed to the excellency of that will against which we were rebelling. In thus revealing the will of the Father towards sinful men, he necessarily became a man of sorrow and suffering, but these arose naturally out of what he was, and the relation in which he stood to those for whom he suffered; and to the holiness and love of his very nature must we refer their awful intensity and immeasurable amount. He suffered what he suffered just through seeing sin and sinners with God's eyes, and feeling in reference to them with God's heart. By what he suffered, he condemned sin, and revealed the wrath of God against it. His holiness and love taking the form of suffering, compose the very essence and adequacy of his sacrifice for sin.

Again, in dealing with God on behalf of man, the oneness of mind with the Father which towards man took the form of condemnation of sin, became in his dealing with the Father in relation to us a perfect confession of our sins, which was a perfect Amen in humanity to the judgment of God on the sin of man. Such an Amen was due in the truth of all things, due on our behalf, though we could not render it, due from him as in our nature and our true brother. He who was the truth, could not be in humanity and not utter it. This confession of our sins by him who, as the Son of God and the son of man in one person, could perfectly realise the evil of man's alienation—this Amen from the depths of the humanity of Christ to the divine condemnation of sin, has all the elements of a perfect repentance in humanity, for all the sin of man—all except the personal consciousness of sin; and by that perfect response or Amen to the mind of God, in relation to sin, is the wrath of God rightly met, and that is awarded to divine justice which is its due, and could alone satisfy it. This confession of the world's sin by the Head and Representative of humanity, was followed up by his intercession as a part of the full response of the mind of the Son

to the mind of the Father. 'He bore the sins of many, and made intercession for the transgressors.'

(3) F. D. Maurice professed to hold a purely biblical theology, as opposed to the theologies of consciousness, which he repudiated. His doctrine of the atonement is the answer which the Bible gives to the demands of a sin-smitten conscience. A sinner requires, and is content to be told on the authority of Scripture, that the Son of God has taken away sin. This message from God is the gospel for all men. The sinner wants to be assured that God has spoken, that he has declared himself the Reconciler, and desires to be shown how and in whom he has accomplished that work on his behalf.

To this question—How and in whom the work of reconciliation has been accomplished—Maurice replied as follows: The will of God is set forth in the Bible to be a will which is good to all, and the ground of all that is right, true, just, and gracious; the Bible also sets forth the Son of God as being one in will, purpose, and substance with the Father, and shows that his whole life on earth was an exhibition of, and submission to his Father's will. The Son of God was Lord of men, the Root and Head of humanity, and the source of all light and righteousness in man. Being thus one with God and one with man, he brought the will of God into our nature, and fulfilled it in our nature perfectly. In the fulfilment of this will in our nature, as its head, he shared its sufferings, enduring that wrath or punishment which proceeded from Holy Love; thus realising, on the one hand, the sins of the world, and on the other, the consuming fury of the holiness of the love of God, with an anguish which only a perfectly pure and holy Being, who is also a perfectly sympathising and gracious Being, can feel. The man Christ Jesus was for this reason the object of his Father's continual complacency—a complacency fully drawn out by the death of the cross—which so perfectly brought out to view the uttermost power of self-sacrifice which lay hidden in the divine love, and consequently he exhibited humanity, in its head, atoned for, reconciled.

N. Oxenham's *Catholic Doctrine of the Atonement* (2d ed. 1869); Tayler (J. J.), *Christian Aspects of Faith and Duty*; Maurice, *Theological Essays*; the great work of Ritschl, *Die Christliche Lehre von der Rechtfertigung und Veröhnung* (3 vols. 2d ed. 1870-74); and Dr G. Jamieson's *Discussions on the Atonement. Is it Vicarious?* (1887). See also the articles ELECTION, PREDESTINATION, SACRIFICE, &c. in this work.

Atony (Gr. *a*, 'not,' and *teino*, 'I stretch'), in Medicine, slackness, debility of the whole body, or of any muscular organ.

Atrato, a river of Colombia, interesting because it has repeatedly been made to bear a part in schemes for a ship-canal across the Isthmus of Panama. Rising on the Western Cordillera at an altitude of 10,560 feet above sea-level, it runs 305 miles northward through low swampy country, and falls by several mouths, interrupted by bars, into the Gulf of Darien. It is navigable by steamers for fully 250 miles, being 750 to 1000 feet wide, and 8 to 70 feet deep. A route, surveyed by the United States government in 1871, proposed to connect the Atrato and the Jurador, flowing into the Pacific, by a canal 48 miles long. At the Paris International

Congress (1879) for deciding the best route for the interoceanic canal, that route was, with various others, discussed and rejected in favour of De Lesseps' line from Limon to Panama. Gold-dust is found in and about the Atrato.

Atrauli (*Atrouli*), a town of British India, in the North-west Provinces, 16 miles N.E. of Aligarh. Founded about the 12th century, it is well built, with wide streets, a good bazaar, and an abundant supply of water. Pop. (1871) 15,052; (1881) 16,000.

Atrek, a river of Persia, rising in Khorasan, among the Hazar Masjid Mountains, and thence flowing nearly 350 miles westward to the Caspian Sea, from Shatt downwards along the boundary with the Russian empire. Its width at the mouth is usually only 30 feet, but in the spring tides it overflows its banks to a width of over two miles.

Atrous, son of Pelops, grandson of Tantalus, and elder brother of Thyestes. He was married first to Cleola, who bore him Pleisthenes, then to Ærope, who had been wife of his son Pleisthenes, and who bore him Agamemnon and Menelaus, and lastly to Pelopia, daughter of his brother Thyestes. Having to flee for the murder of his half-brother Chrysippus, he came along with Thyestes to Mycenæ, and ultimately became its king. Here his wife Ærope was seduced by Thyestes, who, when banished for this outrage, sent Pleisthenes to slay Atrous, but the latter slew the youth instead, not knowing him at the time to be his own son. In revenge he killed the two sons of Thyestes, and placed their flesh before the father at a banquet ostentatiously made to celebrate the reconciliation. The unhappy father fled in horror, and the vengeance of heaven, in the shape of famine, fell on Atrous for his abominable atrocity. Advised by the oracle to call back Thyestes, he went to search for him, and at the court of King Theoprotus married his third wife Pelopia, whom he believed to be a daughter of Theoprotus, but who was really a daughter of Thyestes, and at the time with child by him. This child, Agisthus, afterwards slew Atrous when commissioned by the latter to slay his own father Thyestes. The tragic fate of the house of Pelops gave materials to the great tragic poets of Greece, whom Milton in his *Il Penseroso* speaks of as 'presenting Thebes or Pelops' line, or the tale of Troy divine.'

Atri, or ADRIA. See ADRIA.

At'riplex. See CHENOPODIACEÆ and ORACHE.

Atrium, in Roman Architecture, was the hall which formed the chief part of a Roman house; into it one entered from the vestibule by the main door. It was lighted from the roof, which sloped towards an opening in the centre (the *compluvium*), through which the rain-water flowed into a kind of cistern situated on the floor (the *impluvium*). On both sides, passages led to the several chambers, and behind it was the roofless *cavadium*. In early Rome, the family gods and the nuptial couch stood in the atrium, which was used as the common public apartment, where the mistress and her maids sat spinning; but in later times it was reserved as a general waiting-room for visitors and clients.—In ecclesiastical architecture, the atrium was an open court before a church, where penitents and others stood to solicit the prayers of the faithful.

Atropa. See BELLADONNA.

Atrophy (Gr. *a*, 'not,' and *trophê*, 'nourishment'), an alteration of the vital processes in a living organism, either animal or vegetable, resulting in a diminution in size and functional activity of the whole organism (general atrophy), or of certain of its organs or tissues. It may be a natural process, as in atrophy of the thymus gland

during childhood, or in general atrophy of old age; but is much more commonly the result of disease or injury. It may be caused (1) by a deficient supply of nourishment, as by starvation and diseases affecting digestion, or by injury of or pressure on the arteries supplying a part with blood, as when beggars produce atrophy of their muscles by tight bandaging of their limbs; (2) by excessive waste of tissue, as in fevers; (3) by diminished functional activity, as in atrophy of paralysed limbs from disease; and (4) by certain poisons, such as iodine, lead. Compare HYPER-TROPHY, NUTRITION.

Atropia, or ATROPINE, $C_{17}H_{23}NO_3$, is an alkaloid existing in all parts of the deadly nightshade (*Atropa belladonna*). The seeds of the thorn-apple (*Datura stramonium*) also contain an alkaloid, Daturine, which for long was believed to be identical with atropia. Recent researches seem to indicate that it is, however, only isomeric, and that it is only half as poisonous as atropia. It may be prepared from the juice of belladonna by heating it to 194° F. (90° C.), filtering, and after addition of potash, shaking with chloroform. The crude alkaloid obtained after evaporation of the chloroform is purified by crystallisation from hot alcohol. The crystals occur in colourless silky needles, united in tufts. It is very poisonous, 1/16th of a grain causing dryness of the throat; but it is nevertheless used internally or by injection in cases of whooping-cough and ptialism. It is also used as an antidote in cases of opium poisoning. A solution of sulphate of atropia in water dropped into the eye is now generally preferred to belladonna lotions or ointments for eye diseases. It produces dilatation of the pupil and paralysis of the accommodation, which do not completely pass away for some days; and also a sedative and curative effect in many inflamed conditions. A solution of about four grains to the ounce is most often employed; but a single drop of a very much weaker solution affects the pupil.

At'ropos, one of the Fates (q.v.).

Atta'ché (Fr.), one attached to or connected with another, as a part of his suite or attendants. The term is specifically applied to young diplomats on the staff of an ambassador.

Attachment is an English legal term, signifying the form of process by the authority of which the person or the goods of a debtor may be seized in satisfaction. As a proceeding against the person, it is a species of criminal process, and has the force of much that will be found under ARREST (q.v.). In form, it is a writ addressed to the sheriff, commanding him to attach the person against whom it is issued, and have him before the court to answer for some act or default amounting to contempt of court. Thus, in Hawkins's Pleas of the Crown, such contempts are thus classed: (1) Disobedience to the Queen's writs; (2) Contempts in the face of a court; (3) Contemptuous words or writings concerning a court; (4) Refusing to comply with the rules and awards of a court; and (5) Forgery of writs, or any other deceit tending to impose on a court. Parties are also liable to the process of attachment as for a contempt of court where, in an arbitration (see ARBITRATION) the award having been made a rule of court, the parties refuse to obey the same. In Chancery, there may be attachment of the person for judicial default or other offence to the court, as, for example, where a defendant fails to put in a proper defence to the plaintiff's statement of claim. A witness who fails to attend when duly summoned is in such event considered to have committed a contempt of court, and to be liable to be punished for such contempt by attachment.

No attachment may be issued without the leave of the court, to be applied for on notice to the party against whom it issues.

The proceeding by attachment of debts or goods in hands of a third party resembles in some respects the Scots diligence or process of arrestment (see ARRESTMENT). The best illustration we can give of it, in this sense, is that relating to the power of a judgment creditor to recover under his judgment. Under the rules of court now in force, a judgment creditor may, on an *ex parte* application, obtain a garnishee order to attach debts owing to the debtor from any third person within the jurisdiction; and the third person or Garnishee (q.v.) may be ordered to attend and show cause why he should not pay his debt to the judgment creditor. This latter proceeding is the equivalent of the action of forthcoming in Scotland. The ordinary diligence of arrestment in execution against the movable estate of a debtor, as practised in Scotland, is in England not usually called attachment, but simply execution of judgment debt.

Foreign Attachment originated in the custom whereby the citizens of London, Bristol, Exeter, and Lancaster, when suing foreigners—i.e. debtors outside the city—were entitled before judgment to attach their goods or debts in the hands of a garnishee, and so compel them to appear and plead. It is still competent in the Mayor's Court of London, though not in the High Court of Justice. It resembles the Scottish procedure of arrestment in security and *ad fundandam jurisdictionem*. See ARRESTMENT.

In the United States, attachment may be defined as the taking into the custody of the law the person or property of one who is already before the court, or of one whom it is sought to bring before the court; also a writ for this purpose. To some extent it is of the nature of a criminal process. In some states, attachments are distinguished as foreign and domestic—the former issued against a non-resident having property within the jurisdiction of the state, the latter against a resident in the state; jurisdiction over the person or property being necessary for an attachment. An attachment issued under a state law which has not been adopted by congress, or by a rule of court, cannot be sustained in a United States court. Money due to a seaman for wages is not attachable in the hands of a purser, the purser being a distributing agent of the government, and in no sense the debtor of the seaman.

Attainder (through Fr. from Lat. *attingere*, 'to touch upon'; supposed erroneously to be through Fr. from Lat. *tingere*, 'to dye,' 'taint'), in English law, is the legal consequence of sentence of death or outlawry, in respect of treason or felony. The erroneous explanation of the word warped its original meaning, and hence the idea of the stain came to be considered as essential. It was followed by *forfeiture of estate and corruption of blood*; and generally it imported extinction of civil rights and capacities. Thus, an attainted person cannot sue in a court of justice; he loses all power over his property; and he is by his attainder rendered incapable of performing any of the duties, or enjoying any of the privileges of a free citizen. It was only in cases of treason that there was an absolute forfeiture of real estate. In cases of murder and other felony (and formerly the majority of crimes were felonies), the forfeiture of lands to the crown lasted only for a year and day; and even this limited forfeiture was in 1814 confined to the case of murder. But then in such cases, by the doctrine of corruption of blood, the heir of the traitor or felon was incapacitated from succeeding, and the land reverted to the lord or superior, who was frequently the crown. Legis-

lation was passed at the time of the Jacobite rebellions to confine the effect of attainder to the person actually convicted, but it was not till 1831 that it became possible in England to trace descent through an attainted person. The forfeiture applied to honours and dignities as well as land; but when land or honours were entailed, it was held that the remainder-men or substitutes were unaffected. In Scotland, the whole law on this subject has been widely different. Forfeiture of movable estate (or escheat) occurred in every case of capital sentence—i.e. almost every felony in former times, and also in every case of outlawry. This was distinguished from the penalty of escheat of movables which was by statute imposed for such crimes as debarment, perjury, and bigamy. Some doubt exists as to how far *civil death* followed in the case of a condemned felon, as in the case of an outlaw. But in Scotland, except in cases of treason, forfeiture never extended to the fee of real estate. There was a life-tenant escheat in favour of the superior, but even the outlaw retained a right of disposing of land. Nor was there in Scotland, except in the case of treason, anything resembling corruption of blood. Upon the other hand, the Scottish law of treason prior to the Union was in some respects more stringent than that of England. It forfeited all interests in an entailed estate and dignity. The laws of the two countries were assimilated by statute, which introduced to Scotland (though with less practical effect) the doctrine of corruption of blood. Those who desire to trace the effect of such laws on the political history of the time should examine Lord Hardwicke's work on the law of forfeiture. Formerly, an attainted person could not give evidence in a court of justice; but that disability in England has been removed by the 6 and 7 Vict. chap. 85, and in Scotland by the 15 and 16 Vict. chap. 27.

But in 1870 the law on this subject was revised and made more consistent with reason by the Act 33 and 34 Vict. chap. 23. No conviction for treason or felony now causes any attainder or corruption of blood, or forfeiture or escheat. When a convicted person is sentenced to any punishment more severe than twelve months' hard labour, he is deprived of any public office or employment, and of any paid pension, or of the right of voting at elections. He may be condemned to pay the costs or expenses incurred in procuring his conviction, and in case of felony to make payment of a sum not exceeding £100, as compensation for any loss of property caused by such felony. He cannot sue for any property, debt, or damage. While he is a convict undergoing any imprisonment, the sovereign may appoint paid administrators to take charge of his property at the convict's expense, to deal with the property, and pay debts, and do what is needed. They may also pay out of his property satisfaction for any loss or injury suffered by third parties as consequence of his criminal or fraudulent act, though no proof of such criminal or fraudulent act may have been made in any court of law. They may also make allowances to support the convict's family. If the crown does not appoint an administrator, justices of the peace may appoint interim curators, if satisfied that it will benefit the convict or his family, or the due administration of his property and affairs. Should any person interfere with the convict's property, the Attorney-general or next of kin may call them to account. When the sentence expires, then the administrator or curators are to account to him for his property. If during the sentence any property be acquired by the convict, it is not to vest in the administrator but is to be his own.

Attainder was sometimes inflicted *after death*: thus, four of the regicides—Cromwell, Ireton,

Bradshawe, and Pride—were attainted posthumously.

In the United States, attainder, as it existed in England prior to the Act 33 and 34 Vict., is absolutely unknown. The Constitution of the United States forbids the enactment of any bill of attainder by congress or any of the states. Prior to the adoption of the Constitution, it was held that state laws banishing the persons and confiscating the property of individuals named for their treason, were valid; but an act of congress disbarring lawyers unless they would take an oath denying past acts of treason, has been held to be unconstitutional as a bill of attainder.

BILL OF ATTAINDER, and BILL OF PAINS AND PENALTIES, are bills in parliament, introduced for penally enacting the attainder and punishment of persons who have criminally offended against the state and public peace. Such a legislative proceeding was had recourse to generally in times of turbulence, when, either from the peculiar nature of the offence, or in consequence of difficulties in the application of the ordinary laws, it became necessary to resort to parliament. During the reign of Henry VIII., persons of the highest rank were frequently brought to the scaffold by such means; among whom may be mentioned the Earl of Surrey, the Earl of Essex, and others, who suffered for denying the king's supremacy. The inquiry under a bill of attainder was entirely in the hands of parliament, who might dispense at their pleasure with such rules and forms of law as appeared inconvenient or unsuitable to the purpose in hand. Accordingly, the bills were often passed upon evidence which could never have been received as sufficient, or even admissible in a court of law; and there are even instances where parties were attainted, and punished, without there being any evidence against them at all, and even without their being heard in their defence. Under the Stuarts, this extraordinary mode of proceeding in parliament was seldom had recourse to in England, and it has been still more rarely used since the accession of the House of Hanover. It has been much debated whether the attainder of Strafford (q.v.) in 1641 was constitutional. The Jacobite movement in Scotland, after the union with that country, was productive of several instances of parliamentary attainder, which, however, resulted merely in the forfeiture of the estates of the attainted parties, and in many such cases the attainder has since been removed by statute. The last instance of bill of attainder for treason was that of Lord Edward Fitzgerald, one of the leaders of the Irish rebellion of 1798. In regard to bills of pains and penalties, perhaps the two most remarkable instances are those of Bishop Atterbury, in 1722 (see **ATTERBURY**), and of Queen Caroline, wife of George IV., in 1820.

The proceedings of parliament in passing bills of attainder, and of pains and penalties, do not vary from those adopted in regard to other bills. But the parties who are subjected to these proceedings are admitted to defend themselves by counsel and witnesses before both Houses. In the best of times, this summary power of parliament to punish criminals by statute should be regarded with jealousy; but whenever a fitting occasion arises for its exercise, it is undoubtedly the highest form of parliamentary judicature. In impeachments, the Commons are but accusers and advocates; while the Lords alone are judges of the crime. On the other hand, in passing bills of attainder, the Commons commit themselves by no accusation, nor are their powers directed against the offender; but they are judges of equal jurisdiction and with the same responsibilities as the Lords; and the accused can only be condemned by the unanimous judg-

ment of the Crown, the Lords, and the Commons. —May's *Proceedings of Parliament*, 3d edition, p. 509. See also **FORFEITURE**, **IMPEACHMENT**, **TREASON**.

Attalea, a genus of palms, chiefly natives of the tropical parts of America. See **PALM**.

Attar. See **OTTO OF ROSES**.

Attempt is a technical term in the criminal law of England and of Scotland, and is applied to any act done with the intention of committing a crime, and which can fairly be described as one of a series of acts which would constitute the crime, if uninterrupted and successful. It does not matter that the accused has decided not to proceed further with the commission of the crime. According to the rule of English law, every attempt to commit an offence is a misdemeanour, except that in a few cases—e.g. murder—the attempt is a felony. In Scotland, the law of attempt is unsatisfactory. Thus, attempts to steal or to commit fraud, and some other attempts, are, contrary to legal principle, held not to be indictable offences. In 1887 it was proposed to make all attempts indictable. It was also proposed, what has been the law of England since 1851, that under an indictment charging an offence the accused may be convicted of an attempt.

Atterbom, **PETER DANIEL AMADEUS**, Swedish poet, was born at Asbo in East Gotland in 1790, and in 1805 proceeded from the gymnasium of Linköping to the university of Upsala, where he was appointed professor of Logic (1828) and of *Æsthetics* (1835). He died 21st July 1855. Atterbom was the leader of the Swedish Romanticists, called 'Fosforisterna' from their organ *Phosphorus* (1810-14), of which he was editor, as also of the *Poetisk Kalender* (1812-22). His works, which present a curious blending of the hyper-romantic with German philosophy, fill thirteen volumes (1854-70). The best are *Lycksalighetens Ö* ('Island of Happiness'), and a cycle of romances, *Blommorna* ('The Flowers').

Atterbury, **FRANCIS**, Bishop of Rochester, was born 6th March 1662, at Milton, near Newport-Pagnell, Buckinghamshire, and educated at Westminster School, whence in 1680 he passed to Christ Church, Oxford. In 1687 he gave proof of that ready controversial talent which distinguished him through life, in a reply to a pseudonymous attack on Protestantism by Obadiah Walker, master of University College. Taking orders about the same time, he won such reputation as a preacher, that he was appointed lecturer of St Bride's (1691), a royal chaplain, and minister to Bridewell Hospital. In 1698 a sensation was created in the learned world by the Hon. Charles Boyle's *Examination of Dr Bentley's Dissertations on the Epistles of Phalaris* (q.v.). This clever, but shallow performance was really composed by Atterbury, who had been the young nobleman's tutor at Christ Church. In 1700 he distinguished himself in a controversy with Dr Wake regarding the powers and privileges of Convocation. His zealous and caustic defence of the ecclesiastical against the civil authority, procured him the thanks of the lower House of Convocation, the archdeaconry of Totnes, a canonry of Exeter, and the degree of D.D. In 1704 he was promoted to the deanery of Carlisle; in 1710 was chosen prolocutor of Convocation; in 1712 became Dean of Christ Church; and in 1713 was made Bishop of Rochester and Dean of Westminster. To Atterbury is ascribed, with great likelihood, Dr Sacheverel's famous defence (1710) before the Lords; and he was author of the scarcely less famous *Representation of the State of Religion* (1711). He may well have aspired to the primacy; but the death of Queen Anne extinguished his hopes in

that direction. His known character and Jacobite leanings made him no favourite with George I. In 1715 he refused to sign the bishops' declaration of fidelity, and some of the most violent protests of the Peers against the government measures proceeded from his reckless pen. His deep complicity in a succession of plots for the restoration of the Stuarts at length brought down upon him the charge of treason, and in 1722 he was committed to the Tower. A bill of pains and penalties was brought into the House of Commons, and passed in the Lords by 83 to 43. Atterbury, who had defended himself with great ability, was deprived of all his ecclesiastical offices, and for ever banished the kingdom. No doubt he was implicated in treasonable plots, but the legal proof on which this sentence was founded cannot be deemed sufficient to justify its severity. In 1723 he quitted England, and after a short stay at Brussels, settled in Paris, where he died, 15th February 1732. He was laid in a nameless grave in Westminster Abbey. His works, which fill ten volumes, comprise sermons, and letters to Pope, Swift, Bolingbroke, and others of his friends—the brightest luminaries of that Augustan age. See Macaulay's article, and Williams' *Memoirs and Correspondence of Atterbury* (2 vols. 1869).

Attestation, in Conveyancing, is the verification of the execution of deeds and wills by witnesses; hence the clause at the end of these instruments which immediately precedes the signatures of the witnesses, is called the attestation clause (see DEED, WILL, WITNESS). In the Scotch practice, the corresponding clause is called the Testing-clause (q.v.).

Attic, a term in Architecture, employed to designate a low story rising above the cornice that terminates the main elevation of a building. Such a structure was usually of the *Attic order*, having square columns or pilasters instead of pillars. In domestic architecture, the word is usually applied to sky-lighted rooms in the roof.

Attica, one of the political divisions or states of Hellas or ancient Greece, of which Athens was the capital. Its area was about 640 sq. m., rather smaller than that of Lanarkshire. The territory is of triangular shape, having its north-east and south-west sides washed by the sea, while on the north it is connected with the mainland. In ancient times it was bounded on the W. by Megaris and the Saronic Gulf; on the S., which ran out into the 'marble steep' of Sunium, by the Ægean Sea; on the E. by the Ægean Sea; and on the N. by Boeotia, from which it was separated by a lofty range of hills, the most famous part of which was formerly called Cithæron. Ancient Attica was thus walled in from the rest of Greece; whilst within its own limits rose Mount Parnes (4634 feet), Pentelicon (3641), Hymettus (3368), Egaleus (1535), Lycabettus (911), and the Athenian Acropolis (513). The largest plains extend in the neighbourhood of Athens and Eleusis. The two principal rivers were the Cephissus and Ilissus, which, if they exhibited the same features in ancient times as they do now, must have been mere mountain-torrents, dry in summer. The unfruitfulness of the soil, and the scarcity of water, compelled the inhabitants occasionally to send out colonies. As early, however, as the time of Solon, Attica was well cultivated, and produced wine and corn. Mount Hymettus was celebrated for its bees and honey, and metals were found in the range of Laurium. Figs, olives, and grapes are still cultivated. Goats and sheep find suitable pasturage; but the country does not now produce much grain. According to ancient tradition, the Autochthons of Attica were first civilised under Cecrops, who is said

to have come thither from Saia, at the mouth of the Nile in Egypt, about 1550 B.C., and to have introduced the culture of olives, and of several species of grain, as also to have implanted milder manners, and taught the worship of the gods. He is stated to have divided the country into twelve communities or states. This, however, was not the only division known in early Attica. A still older division into *phylai*, or tribes, existed, as also a minute subdivision into *demoi*, or townships. By Theseus Athens was united with the eleven other states of Attica under one government, of which Athens was made the seat. After this union of the several states, the whole of Attica shared in the fortunes of Athens (q.v.), and, under Vespasian became a Roman province. On the division of the Roman empire, Attica naturally fell into the hands of the Greek emperors. In 396 A.D. it was captured by Alaric, king of the Goths. What may have been its population in ancient times it is impossible to determine precisely. Clinton estimates it at upwards of half a million, but this is probably exaggerated. To-day Attica and Boeotia together form a nomarchy or government in the kingdom of Greece, with an area of 2472 sq. m., and a pop. (1879) of 185,364.

Atticus, TITUS POMONIUS, was born in Rome 109 B.C., or three years before the birth of Cicero, along with whom and the younger Marius he received a good education. In 85 B.C. he withdrew to Athens, glad to be separated from the political distractions of his native land. After 65 B.C., when Sulla induced him to return to Rome, he still devoted himself chiefly to study and the pleasures of friendship, and refused to take any part in politics. Yet he was by no means without influence on public affairs, as he lived on terms of familiar intercourse with several leading statesmen, and freely gave his counsel, which was generally sound and wholesome, while it was always benevolent. He was a man of great wealth, having been left a large inheritance by his father and his uncle, which he greatly increased by judicious speculations. His mode of life was frugal. In 32 B.C. he was informed that a disorder under which he was labouring was mortal, and died after five days of voluntary starvation. An Epicurean in philosophy, he was intimately acquainted with both Greek and Roman literature, and his taste was so good that Cicero used to send him his works for the benefit of his revision. None of his own writings have been preserved, but we have a series of 396 epistles addressed to him by Cicero, ranging from the year 68 to 44 B.C. His life by Cornelius Nepos is unfortunately a panegyric rather than a biography.

Attila (Ger. *Etsel*; Hungarian, *Etelek*), the 'Scourge of God,' was born about 406, the son of Mundzuk, king of the Huns, and in 434 succeeded his uncle Rhuas as chief of countless hordes scattered over the north of Asia and Europe. His brother Bleda shared with him the supremacy over the Huns, but was put to death about 444 by Attila, whom the Huns regarded with superstitious reverence, and Christendom with superstitious dread. Men believed that he was armed with the sword of the Scythian war-god, which must win dominion over the whole world. It is not certain when the name 'Scourge of God' was first applied to Attila; but he is said to have received it from a hermit in Gaul. The whole race of Huns was regarded in the same light. In an inscription at Aquileia, written a short time before the siege in 452, they are described as *imminentia peccatorum flagella* ('the threatening scourges of sinners'). The Vandals, Ostrogoths, Gepidae, and many of the Franks fought under Attila's banner, and in a short time his dominion extended over the people of Germany.

and Scythia—from the Rhine to the frontiers of China. In 447, after an unsuccessful campaign in Persia and Armenia, he advanced through Illyria, and devastated all the countries between the Black Sea and the Mediterranean. Those inhabitants who were not destroyed were compelled to follow in his train. The Emperor Theodosius collected an army to oppose the barbarians' inrush, but in three bloody engagements fortune declared against him. Constantinople owed its safety solely to its fortifications and the ignorance of the enemy in the art of besieging; but Thrace, Macedon, and Greece were overrun; seventy flourishing cities were desolated; and Theodosius was compelled to cede a portion of territory south of the Danube, and to pay tribute to the conqueror, after treacherously attempting to murder him. In 451 Attila turned his course westward, and invaded Gaul, but here was boldly confronted by Aëtius, leader of the Romans, and Theodoric, king of the Visigoths, who compelled him to raise the siege of Orleans. He then retired to Champagne, and in the wide plain of the Marne—called anciently the Catalaunian Plain—waited to meet the enemy. The army of the West, under Aëtius and Theodoric, encountered the forces of the Huns near the site now occupied by the city of Chalons-sur-Marne. Both armies strove to obtain the hill of moderate height which rises near Murry, and commands the field of battle, and after a terrible contest, the ranks of the Romans and their allies, the Visigoths, were broken. Attila now regarded victory as certain, when the Gothic prince, Thorismund, immediately after his father had fallen, assumed the command, and led on the brave Goths, who were burning to avenge the death of Theodoric. Their charge from the height into the plain was irresistible. On every side the Huns were routed, and Attila with difficulty escaped into his encampment. This, if old historians are to be trusted, must have been the bloodiest battle ever fought in Europe; for it is stated by contemporaries, that not less than 252,000 slain were left on the field—a field, says tradition, yet haunted by their spectres. Attila, retiring within his camp of wagons, collected all the wooden shields, saddles, and other baggage into a vast funeral pyre, resolved to perish in the flames rather than yield; but by the advice of Aëtius, the Roman general, the Huns were allowed to retreat without much further loss, though they were pursued by the Franks as far as the Rhine. In the following year Attila had recovered his strength, and made an incursion into Italy, devastating Aquileia, Milan, Padua, and other cities, and driving the terrified inhabitants into the Alps, the Apennines, and the lagoons of the Adriatic, where they founded the city of Venice. The Roman emperor was helpless, and Rome itself was saved from destruction only by the personal mediation of Pope Leo I., who visited the dread barbarian, and is said to have subdued his ferocity into awe by the apostolic majesty of his mien. This deliverance was regarded as a miracle by the affrighted Romans, and old chroniclers relate that the apostles Peter and Paul appeared in Attila's camp, and changed his purpose. By 453, however, he seems to have forgotten their visit, for he made preparations for another invasion of Italy; but he died on the night of his marriage with the beautiful Ildiko, or Hilda, perhaps by her hand, more probably of hemorrhage. His death spread consternation through the host of the Huns. They cut themselves with knives, and shaved their heads, and then prepared to celebrate the funeral rites of their king. It is said that his body was placed in three coffins—the first of gold, the second of silver, and the third of iron; that the caparisons of his horses, with his arms and ornaments, were buried with him; and that the captives employed to make his grave were all put to death,

that none might betray the resting-place of Attila. Jornandes describes him as having the Mongolian characteristics—low stature, a large head, with small, brilliant, deep-seated eyes, and broad shoulders. See Gibbon's *Decline and Fall*, and Thierry's *Histoire d'Attila* (4th ed. 1874).

Attleborough, a market-town of great antiquity in Norfolk, 16 miles SW. of Norwich by rail. It had a college of the Holy Cross (1387); and its cruciform parish church contains some interesting monuments. Pop. of parish (1881) 2244.

Attleborough, a post-village in Massachusetts, U.S., 31 miles SW. of Boston by rail. Pop., with North Attleborough, (1880) 11,111.

Attock, a town and fort of the Punjab, on the left or east bank of the Indus. Attock stands below the fort, a parallelogram of 800 yards by 400, established by the Emperor Akbar in 1581, to defend the passage of the river, but it is no longer a position of strength. The great railway-bridge across the Indus here was opened in 1883. It has five arches 130 feet high, and renders continuous the railway connection between Calcutta and Peshawur (1600 miles). The situation of Attock is important, whether in a commercial or in a military view. It is at the head of the steam-boat navigation of the Indus, being 940 miles from its mouth; while, about 2 miles above it, the Cabul River, the only considerable affluent of the Indus from the west, is practicable for vessels of 40 or 50 tons for a distance of 50 miles. The valley, again, of this last-mentioned stream, presenting, as it does, the best approach to the east and south from Central Asia, has been the route of nearly all but the maritime invaders of India from the days of Alexander the Great downwards. *Taxila*, where the Macedonians crossed the Indus, has been identified with Attock. Pop. 4000.

Attorney ('one appointed,' from the old verb *attorn*, 'turn, assign, or appoint'), a term of English law, used in a general sense to describe any person authorised to act on behalf of another, as, for example, the holder of a power or letter of attorney authorising him to sell property or do some other act on behalf of the grantor. 'Attorney-at-law' was formerly the proper style of those members of the legal profession who represented litigants in the courts of common law, and retained counsel on their behalf; but since the Judicature Act, 1873, it has been superseded by the designation of Solicitor (q.v.).

In the United States, the term attorney-at-law is used for one standing in the place of another in matters of law, including in itself the special offices designated in English and Scotch law by the terms advocate, attorney, barrister, counsellor-at-law, lawyer, proctor, and solicitor, although all these terms, except barrister, are sometimes used as applicable to the attorney-at-law in the performance of the duties pertaining to his office.

The attorney-at-law is not a governmental officer, but is an officer of the court, responsible to the court under whose immediate supervision he is, for the faithful performance of his duties. He has property in his office, and although he may be punished summarily for official misconduct occurring in open court, he cannot be removed from his office without special cause and without having an opportunity to be heard by himself or counsel.

Empowered to stand in the place of his client in all matters of law, he performs all acts necessary for the successful prosecution or defence of his suit, not only in the office preparation of the cause, but also in arguing the same in open court.

Each state prescribes by statute the qualifications of its own attorneys, but generally a pre-

liminary examination as to educational qualifications is required, followed by a clerkship of from two to four years in the office of a regular practising attorney of known ability, whose duty it is to register the name as a student-at-law in the office of the prothonotary of the county; after this comes an examination as to legal attainments by a board of examiners appointed by the court, or graduation as Bachelor of Laws at a law college or university. A good moral character is always demanded.

Any person who has been admitted to the highest court of a state is eligible for admission to the district and circuit courts of the United States for that state, but to be admitted to the Supreme Court of the United States, it is necessary that an attorney shall have for three years been a practitioner in the Supreme Court of the state to which he belongs, and that his private and professional character shall be fair. His oath of office requires him to support the constitutions of his state and of the United States, and to behave himself with all fidelity to the court and to the client—hence citizenship of the United States and of the state are requisite.

The efforts of women to be admitted as attorneys-at-law in the state courts since 1870, and the refusal of the Supreme Court of the United States to admit women as attorneys, resulted in the enactment by congress, in 1879, of the following statute: 'Any woman who shall have been a member of the bar of the highest court of any state or territory, or of the Supreme Court of the district of Columbia for the space of three years, and shall have maintained a good standing before such court, and who shall be a person of good moral character, shall on motion and the production of such record, be admitted to practise before the Supreme Court of the United States.' Under this act, several women who have complied with its provisions have been admitted to practise as attorneys-at-law in the Supreme Court of the United States, but some of the states do not yet admit women to practise as attorneys. In 1887 about one hundred women, married or single, had been admitted as attorneys in the United States.

An attorney's warrant of attorney must be commensurate with the work to be done. The fiduciary relation between attorney and client cannot be delegated. In case of his death, service of papers cannot be made upon his law partner or executor, neither can he withdraw from the case without leave of the court. If removed by his client, which in most cases must be done by leave of court, he has a lien upon the papers in the cause for his fee.

An attorney-at-law is required to act with the utmost diligence and fidelity to his client, but his undertaking is not that he possesses perfect legal knowledge or the highest degree of skill in relation to the business he undertakes, but that he possesses the ordinary legal knowledge and skill common to members of the profession, and that in the discharge of his duties he will exercise ordinary and reasonable diligence, care, and prudence; he is therefore liable to his client for negligence before damage is sustained. An attorney is trustee for his client for money collected, and after demand has been made upon him, he may be sued without notice. His authority to compromise a suit must be given him by his client. His confidential communications with his client are privileged, and are not to be revealed even on the witness stand.

Attorney-general, the title by which, in England and Ireland, the first ministerial law officer of the crown is known. The attorney-general is appointed by letters-patent. His office, powers, and duties correspond in many respects to those

that belong to the Lord Advocate (q.v.) in Scotland, though the powers of the latter functionary are more extensive and less clearly defined. Originally, the attorney-general was simply the king's attorney, and stood to the sovereign in the same relation as any other attorney does to his employer. The term 'general' was afterwards conferred to distinguish him from attorneys appointed to represent the interests of the crown in particular courts, such as the Court of Wards; or from the master of the crown office, who is called the 'Coroner and Attorney for the Queen.' The early history of this office is involved in obscurity. Though there can be no doubt that the crown has always been represented by an attorney in the courts of justice, the first record of the designation *Attornatus Regis* belongs to the reign of Edward I. (1272-1307). Up to a period comparatively recent, the king's serjeant was the chief executive officer of the crown in criminal proceedings, and this circumstance gave rise to various questions of difficulty as to the right to precede of these officers respectively. These questions were set at rest in 1811, by a special warrant by the then Prince Regent, afterwards George IV., by which it was declared that both the attorney and solicitor general should have place and precedence before all other members of the English bar. A similar question arose in a Scotch appeal in the House of Lords in 1835, between the Attorney-general and Lord Advocate, which was also decided in favour of the former. The following may be enumerated as the principal duties of the attorney-general: 1st, To exhibit informations and conduct prosecutions for crimes which have a tendency to disturb the peace of the state or endanger the constitution (see PLEA); 2d, To advise the government on legal questions; 3d, To conduct prosecutions in suits relating to the revenue; 4th, To file informations in the Exchequer for personal wrongs committed on any of the possessions of the crown; 5th, To protect charitable endowments in the sovereign's name, as *parens patrie*, and, generally, to appear in all legal proceedings in which the interests of the crown are at stake. The attorney and solicitor general are two of the Commissioners of Patents (q.v.) *ex officio*. The powers of the solicitor-general are co-ordinate with those of the attorney-general, and in the absence of the latter or during a vacancy, the former may perform his functions in all their extent. Both usually have seats in the House of Commons, and their tenure of office concurs with that of the government of which they are members. They were formerly paid fees, but now by fixed salary.

The duchies of Lancaster and Cornwall, and the county palatine of Durham, have separate attorney-generals.

Under the United States government the attorney-general is one of the seven officials who constitute the president's cabinet. These officers are appointed by the president, confirmed by the senate, and removable at pleasure. The attorney-general is the head of the Department of Justice, and his duties are to give advice and opinions to the president, or any of the heads of the executive departments on questions of law arising in the respective departments. He argues suits in the United States courts when considered necessary, provides legal service on behalf of the government in the prosecution or defence of suits at law, examines titles to lands purchased by the United States for public use, and exercises a general superintendence over the minor officials of the United States courts. His salary is \$8000 per annum. Nearly all of the states of the Union have attorney-generals, who are in some instances appointed by the governors, in others elected by the

people. Their duties under the state governments correspond essentially with those of the United States attorney-general under the general government.

Attraction. The mutual action between any two bodies is termed stress. When the stress tends to separate the bodies, or to prevent their mutual approach, it is termed a pressure or repulsion. When the stress is such that the bodies tend to approach each other, it is termed a tension or attraction. The words repulsion and attraction are used when the bodies are considered to influence each other directly; but when the action is considered to be propagated through an intervening medium, the terms pressure and tension are used. Newton believed that no action could be propagated except through a medium. Electric and magnetic phenomena have been very completely accounted for by the action of a medium (see ELECTRICITY). Attempts to explain gravitation by such action have not been so successful. Though they account sufficiently for the observed phenomena, they all postulate the existence of an unlimited supply of energy. Sir W. Thomson has shown that Cohesion (q.v.) can be explained by the Newtonian law of gravitational attraction. See GRAVITATION, CAPILLARITY, CHEMISTRY, MAGNETISM.

Attrek. See ATREK.

Attribute, in Logic, is used to denote the opposite of substance. The latter is considered to be self-existent, while the former can only be conceived as possessing a dependent existence. Attributes are commonly said to belong to substances. Thus, wisdom, holiness, goodness, and truth are termed attributes of God, who is Himself regarded as the substance in which they inhere; in the same way, whiteness is called an attribute of snow.

Attwood, THOMAS, musician, was born in London in 1765, and during 1783-87 studied at Naples under Cinque and Latilla, at Vienna under Mozart. With some other appointments, he held that of organist of St Paul's from 1796 till his death, 24th March 1838. His works, more tuneful than nervous, include two coronation anthems, songs, glees, and pianoforte pieces.

Atwood's Machine, an instrument for illustrating the relations of time, space, and velocity in the motion of a body falling under the action of gravity. It was invented by George Atwood or Attwood, a mathematician of some eminence, who was born in 1745, educated at Cambridge, became fellow and tutor of Trinity College in that university, published a few treatises on Mechanics and Engineering, and died in 1807. It is found that a body falling freely, passes through 16 feet in the first second, 64 feet in the first two seconds, 144 feet in the first three seconds, and so on. Now, as these spaces are so large, we should require a machine of impracticable size to illustrate the relations just mentioned. The object of Atwood's machine is to reduce the scale on which gravity acts without in any way altering the nature of its actions. The machine consists essentially of a pulley, P (see fig. 1), moving on its axis with very little friction, with a fine silk cord passing over it, sustaining two equal cylindrical weights, *p* and *g*, at its extremities. The pulley rests on a square wooden pillar, graduated on one side in feet and inches, which can be placed in a vertical position by the levelling-screws of the sole on which it stands. Two stages, A and B, slide along the pillar, and can be fixed at any part of it by means of fixing-screws. One of these stages, A, has a circular hole cut into it, so as to allow the cylinder, *p*, to pass freely through it; the other is unbroken, and intercepts

the passage of the weight. A series of smaller weights, partly bar-shaped, partly circular, may be placed on the cylinders in the way represented in figs. 2 and 3. A pendulum usually accompanies the machine, to beat seconds of time. The weights of the cylinders, *p* and *g*, being equal, they have no tendency to rise or fall. When a bar is placed on *p*, the motion that ensues is due only to the action of gravity upon it, so that the motion of the whole must be considerably slower than that of the bar falling freely. Suppose, for instance, that *p* and *g* are each 7½ ounces, and that the bar is 1 ounce, the force acting on the system—leaving the friction and inertia of the pulley out of account—would be $\frac{1}{15}$ of gravity, or the whole would move only 1 foot in the first second, instead of 16. If the bar be left free to fall, its weight would bring its own mass through 16 feet the first second; but when placed on *p*, this force is exerted not only on the mass of the bar, but on that of *p* and *g*, which is 15 times greater, so that it has altogether 16 times more matter in the second case to move than in the first, and must, in consequence, move it 16 times more slowly. By a proper adjustment of weights, the rate of motion may be made as small as we please. The various formulæ (see KINEMATICS) connecting time, speed, and space fallen through under gravity can be experimentally verified by such an instrument. For example, if the weight of *p* be increased by a small amount, and the space it falls through in one second be noted, it is found that after two seconds it has fallen through four times that space, and so on. Thus, the space fallen through from rest is proportional to the square of the time occupied in falling.

Atwood's Machine.

Aubagne, a town in the French department of Bouches-du-Rhône, on the river Huveaune, 10½ miles E. of Marseilles by rail. The *Albania* of the Celtic Albici, it has a ruined castle, and a monument (1828) to the Abbé Barthélemy, and it trades in fruit and wine. Pop. 5000.

Aube, a department in the north-east of France, occupying the southern part of the old province of Champagne and a small portion of Burgundy, bounded by Marne, Haute-Marne, Yonne, and Seine-et-Marne. The eastern part belongs to the basin of the river Aube; the western to that of the Seine. Area, 2310 sq. m. Pop. (1886) 257,374. The climate is moist, but healthy. A great portion of the area is arable land. The north-east is chiefly pastoral; but the south-east is far more fertile, rich in meadow-land and forest, and producing grain, hemp, rape, hay, timber, and wine. The minerals are iron, building-stone, marble, chalk, marl, and potters' clay. Many persons are employed in the iron-industry, in cotton-spinning and weaving, in silk-spinning, and in the production of cloth, porcelain, faience, glass, paper, soap, and rape-sugar. There is an active commerce in wine, timber, and country produce by the railways, with which the department is covered, and of which its capital,

Troyes, is the centre. The river Aube rises near Mount Saule, on the plateau of Langres, and flows 140 miles north-westward by La Ferté, Bar, and Acriis, to the Seine.

Aubenas, a town of SE. France, in the department of Ardèche, 50 miles NNE. of Alais by rail. It is built on a height rising 688 feet above the river Ardèche, and has a fine old castle. The inhabitants are employed in coal and iron mining, tanning, paper-making, and silk-culture; and the town is a great silk emporium. Pop. (1881) 5356.

Auber, DANIEL FRANÇOIS ESPRIT, a composer of operas, was born at Caen in Normandy, January 29, 1784. His father, who was a printseller in Paris, sent him to London to acquire a knowledge of business. But his irresistible passion for music obtained the upper-hand, and after a short stay he returned to Paris. Among his earliest compositions may be noticed his very successful *concertos* for the violoncello, the concerto for the violin, and the comic opera, *Julie*. Aspiring to greater things, he now devoted himself to a deeper study of music under Cherubini, and wrote a mass for four voices. His next work, the opera *Le Séjour Militaire* (1813), was coldly received; but the death of his father compelled him to be dependent on his profession. In 1819 appeared *Le Testament et les Billets-doux*, which was also unsuccessful; but in *La Bergère Châteline* (1820) he laid the foundation of his subsequent fame. In all these early essays he displayed a style of his own; and though afterwards he was profoundly influenced by Rossini, his work has always a distinctive character. In 1822 he became associated with Scribe, who provided him subsequently with librettos admirably adapted to his music. Most of Auber's operas correspond to Scribe's comedies of Parisian life. Instead of deep natural feelings, they reflect elegant and brilliant French manners and conversation; the music is melodious, graceful, entertaining, but for the most part deficient in depth of thought and feeling. By far the most important and successful of his operas is *La Muette de Portici*, usually known as *Masaniello* (1828); of the lighter works, *Fra Diavolo* (1829) is the best known. Of his forty operas the next most notable are *Le Domino Noir* (1837); *Les Diamants de la Couronne* (1841), *Haydée* (1847), *La Fiancée du Roi de Garbe* (1864), and *Rêves d'Amour* (1869). He composed a work for the London Exhibition of 1862. He was a member of the Institute, director of the Conservatory of Music, and commander of the Legion of Honour. He died at Paris, May 13, 1871.

Aubervilliers, a place in the Seine department, about 5 miles N. of Paris, with a fort included within the system of fortification of the capital. Its industries are iron-founding, manufactures of caoutchouc, paper, varnished leather, glass, and chemicals. Pop. (1881) 19,437.

Aubigné, MERLE D'. See D'AUBIGNE.

Aubrey, JOHN, antiquary and folklorist, was born at Easton Percy, near Chippenham, in Wiltshire, 12th March 1626, and was educated at Malmesbury, under Latimer, Hobbes's preceptor, at Blandford grammar-school, and at Trinity College, Oxford. He entered the Middle Temple in 1646, but was never called to the bar; in 1652 he succeeded to estates in Wiltshire, Herefordshire, and Wales, but was forced through lawsuits to part with the last of them in 1670, and with his books in 1677. His last years were passed, in 'danger of arrests,' with Hobbes, Ashmole, and other protectors, till in June 1697 he died at Oxford, on his way back from London to Draycott. His quaint, credulous *Miscellanies* (1696) was the only work printed in his lifetime; but he left a large mass of materials. Of these, his Wiltshire and Surrey collections have

in part been published; his 'Minutes of Lives' (Hobbes, Milton, Bacon, &c.), given to Antony Wood, first appeared in *Letters by Eminent Persons* (1813); and his *Remains of Gentilism and Judaism* was issued by the Folklore Society in 1880. See an article by Professor Masson in the *British Quarterly* (1856).

Auburn, the name of several places in the United States. (1) The most important of these is in the state of New York, 173 miles W. by N. of Albany. The outlet of Owasco Lake flows through the town, furnishing a water-power which is employed in mills of various kinds, and in manufactures of agricultural machinery on a large scale: wool, cotton, silk, carpets, iron, boots, shoes, flour, and paper. The number of convicts in the state prison, founded here in 1816, usually exceeds 1000; they are employed in the manufacture of boots, shoes, and iron hollow ware. Since 1823 it has been conducted on the 'silent' or 'Auburn' system. There are also a state asylum and a state armoury. Pop. (1870) 17,225; (1880) 21,924; (1890) 25,354. (2) A town of Maine, on the west bank of the Androscoggin River, by which it is separated from Lewiston, 35 miles N. of Portland by rail. It has manufactures of cotton, furniture, and boots and shoes. Pop. (1876) 6169; (1880) 9555; (1890) 11,250.

Aubusson, a town in the French department of Creuse, 47 miles ENE. of Limoges, and 15 miles SSE. of Busséou d'Ahun by rail. Picturesquely situated in the rocky gorge of the river Creuse, it is a well-built place, and is celebrated for the weaving of carpets and tapestry, which is said to have been introduced by Arab fugitives from the battle of Tours (732). The manufacture of combed cotton and woollen goods is also carried on, and there is some trade in wine and salt. Pop. 6406.

Aubusson, PIERRE D'. See D'AUBUSSON.

Auch, the capital of the French department of Gers, on the river Gers, 44 miles S. of Agen by rail. The *Augusta Auscorum* of the Romans, it is built on a hill, whose summit is crowned by the cathedral (1489-1662), rich in stained glass and carved woodwork. A flight of 200 steps leads to it from the river. The chief articles of trade are woollen and cotton stuffs, fruits, wine, and the brandy of Armagnac. Pop. (1881) 12,175.

Auchenia. See LLAMA.
